PUBLISHER'S NOTE

In the year 2004, on returning from South East Asia, Nobel Prize recipient, Sir Vidia Naipaul requested us to arrange a meeting with a group of Delhi based thinkers to share the impressions of his visit. He was simply overwhelmed with what he saw in South East Asian countries like Indonesia, Thailand, Cambodia etc. We hurriedly, invited about twenty people to a get together with Sir Vidia. The meeting held on June 15, 2004 was attented by Sarva Shri Dinanath Mishra, Balbir Punj, Brij Kishore Sharma, Shankar Saran, Meenakshi Jain, Sandhya Jain, Ram Madhav, Devendra Swarup and some others. Sir Vidia described how he was astonished to see deep Indian cultural influence in the region not only in the past but even today. He felt sad that present day Indians appeared to have little recollection of the grandeur of their ancient civilization and its lasting contribution to the world civilization. He felt strongly that it would be a worth while endeavour to prepare a compendium of foreign perceptions of India down the ages.

During later discussions, it was decided that the project would cover the period from earliest times up to the mid-nineteenth century, the changed sensibility towards India thereafter consequent to the establishment of the British Colonial rule, being well known. The present volumes are the result of these deliberations.

We are thankful to Sandhya Jain and Meenakshi Jain for agreeing to take up the project despite their other professional commitments and completing it so meticulously. We are grateful to Prof. Devendra Swarup for having agreed to coordinate the project till its fruition. Sandhya Jain compiled and edited the material for the first volume, while Meenakshi Jain prepared the remaining three volumes. Both of them have recorded their experiences and impressions in detailed Introductions to their respective volumes separately.

We wish to place on record our heartfelt gratefulness to Sir Vidia for not only conceiving the project, but also for painstakingly going through volumes I and III and making many valuable suggestions which the editors have attempted to incorporate. We feel indebted to Prof. Lokesh Chandra and Dr. B.M. Pande for their valuable contribution in the preparation of the first volume. We are highly grateful to Prof. Devendra Swarup, without

whose continuous active guidance and involvement, this ambitious project would not have seen the light of the day.

We are conscious that many other compilations of foreign accounts on India are already available, but we do feel that this series of four volumes will add much to the present knowledge of our readers in this area and also pave the way for publication of many other volumes based on the first hand study of the original sources in foreign languages other than English as, it was painfully discovered during the preparation of these volumes that most of the material still lies untranslated into English, which is the only window available to most of the Indian Scholars. With this Note, we offer these volumes to our readers and cordially invite their comments and suggestions, which would help us to improve the quality of the later editions.

INTRODUCTION

The idea of a compilation on India through the eyes of incredulous and enchanted foreign observers was mooted by Sir Vidia Naipaul during a conversation in October 2004, with a view to providing contemporary readers with a bird's-eye view of how this ancient land has ever fascinated and attracted the merchant, the student, the curious, the adventurer, and the devout. These accounts by outsiders offer valuable insights into the history and culture of an epoch in which Indian records were generally deficient from the perspective of modern scholars. The classical writers (mainly Greeks and Romans) and Buddhist pilgrims (Chinese, Koreans) who traversed the region in the early historical period bore witness to the sheer abundance of India's material civilisation, the vastness and variety of her landscape, and her well-earned reputation for spiritual and philosophical efflorescence.

For students of Indian history, these testimonies have proved exceptionally helpful in piecing together the political history of the land and gleaning information on a host of worldly matters on which the native Indian literature of the same period was lacking. Indian tradition tended to portray historical persons and events, traditions, social, moral, legal, and economic issues, from a civilisational perspective, with a view to providing instruction on *dharma* (the Hindu moral paradigm), *artha* (wealth, prosperity and well-being), *kama* (worldy desires and aspirations) and *moksa* (salvation)[1]. Rooted in the poetic labours of *Sutas* and *Magadhas*, royal eulogists who preserved the genealogies of the gods, sages, kings and heroes, these became the bedrock of our *itihasa-purana* tradition, the sources for the myriad *Puranas*, and *Itihasas* such as the *Ramayana* and the *Mahabharata*, which, G.P. Singh argues, "include almost all the elements of historical tradition"[2]. By the age of the Imperial Guptas, royal archives evolved, though these were prone to destruction during periods of political unrest.[3]

Early European travellers and colonial historians tended to dismiss the Indian system of codifying the key facts and lessons of history as mythology, though A.L. Basham conceded, "...we have ample evidence to show that great empires rose and fell in India, and that, as in religion, art,

literature and social life, so in political organisation India produced her own system, distinctive in its strength and weakness."[4] For Europeans inheriting the Greek tradition of historiography, the Indian system of recording chronology in a cosmic time-scale of *yugas* (aeons) was incomprehensible, though modern scientists, astronomers, and climatologists debunking the hysteria over 'global warming' are working along the time-scales of Hindu cosmology. Kalhana's medieval text, *Rajatarangini*, is generally hailed as the first historical account based on proper chronology, though it too deferred to the *Puranas* as source materials. Indeed, no account of Indian history can bypass the ancient traditions and source materials as Indian history is simultaneously civilisational and chronological.

From a modern perspective, however, it must be admitted that India's early indigenous literary corpus is often difficult to date with even reasonable accuracy. The Jainas took to writing early and scrupulously dated all their manuscripts (and monuments and sculptures); modern historians have neglected to scour their literature to settle problems of disputed chronology in India. With regard to the classical writers, however, there is broad academic agreement over the dates of their travels and writings. They had an inquiring mind and eagerly sought details about the religious and worldly lives (which they delineated strictly) of the Indian natives they encountered.

These ancient adventurers were interested in the political history and forms of government, administrative and social systems, military techniques and rules of warfare, taxes, climate and physical landscape, rivers, hills, mountains, flora and fauna, agriculture, trade and commerce, ports, mineral resources, mining and deep sea excavation, social and economic conditions of the Indian kingdoms, the morals and manners of the people, the religious diversity and coexistence, and the actual as well as the ideal conduct of kings. They were enthralled by the multitude of tribes and their linguistic varieties, as also the unique Indian ability to communicate secular and sacred ideas across differences of tribe and language, so that India presented a matchless cultural continuity even in that primeval epoch; they were also impressed by the innumerable settlements (villages, fortified cities) that they encountered.

In our own era, the classical records facilitated the identification of archaeological discoveries, which have deepened our knowledge of the hoary past immeasurably. Yet a word of caution is in order as, for all the light they throw upon ancient society, many authors were so enchanted at arriving in a land so remote from their own – whose civilisational accomplishments had reached their own shores – that they betrayed immense gullibility, swallowing without introspection implausible tales of fabulous races, mythical creatures, and supernatural attainments. Their credulity is surprising in view of the fact that the ancient Greeks themselves possessed a vast intellectual repertoire, with a sophisticated genre of literature and drama, and knowledge of the disciplines of history, geography, mathematics and astronomy, and several well developed schools of philosophy.

Some of this confusion has been attributed to the Greek domination of Egypt and northern Africa, and their tendency to equate India with Ethiopia (Sudan region), a fallacy that persisted even after the voyages of merchants and the travails of Alexander had opened this part of the world to their scrutiny. This partially explains the otherwise inexplicable medley of society and customs, race and colour, topography, geography, climate, flora and fauna that the Greeks reported to their native audience. Even the highly erudite Philostratus thought that the Ethiopians were an Indian people who revolted against their king Ganges and killed him; this led to their expulsion from India, whereafter they settled near Egypt, forming Ethiopia.[5]

Modern scholars trace much of this confusion to Alexander, who carried his own chroniclers along on his campaign to Persia and India; they recklessly transposed Greek mythology and even topography on to the Indian landscape, as part of an exercise to impress their domestic audience regarding their king's heroic exploits. Thus they superimposed or equated their gods Bacchus, Prometheus, Dionysus and Herakles with divinities encountered in India, and insisted their gods had visited this land in the hoary past and bequeathed to it its present religion. Nowhere did the Greek writers pause to wonder why, if that were indeed the case, there was so little in common between their own customs, religious practices and philosophies, and those of the ancient Hindus whose lands they were seeking to conquer.

Respecting the good sense, taste, and enhanced awareness of the modern reader, we have eliminated from the present selection most of the utterly absurd stories which invited the contempt of even contemporary (and later) Greek and Roman scholars, in favour of narratives that showcase the exalted philosophical speculations, unique social customs, and the natural wealth and material abundance that mesmerised India's foreign guests. Our selections from these authors follow conventional chronology, as we believe chronology is the skeleton of history. A brief biographical sketch of the respective authors gives modern readers a flavour of the range of their original and surviving corpus, their mental and physical exertions to acquire and depict an accurate picture of the country, and their success in gleaning information about the land and people in the face of complex difficulties of communication and comprehension. What emerges is an impressive continuity of India's civilisational journey, her ideas and philosophies, customs and practices, material wealth and grandeur, and, above all, her early and unique ability to marry mundane existence to the quest for spiritual truth and liberation.

Despite an often peculiar cocktail of fact and fiction, the classical texts are a treasure trove of information about political history, contemporary rulers, forms of government, administrative institutions, military weapons and rules of warfare, geography, flora, fauna, mineral wealth, natural wealth of rivers and agricultural produce, economic issues like taxation, articles of trade and commerce, social customs and religion, monks and asceticism, the personal virtue of women and the hoary practice of *sati* by women and self-immolation by ascetics (both already entrenched practices which made a strong impression upon the Greeks), and a host of other issues. Yet these amateur scribes sometimes mistook tales from the epics and other legends for reality and this may well be the genesis of the fabulous races and unbelievable creatures that dot the pages of India's history as written by her foreign admirers.

At other times, the writers were clearly superimposing Ethiopian facts or fables on to the Indian landscape. Onesicritus claimed that Kathaea elected the most handsome citizen as king, but he was obviously influenced by Herodotus who mentioned this as an Ethiopian custom.[6] His allusion to ebony as a product of Ethiopia[7] was transferred to India by others.[8] Apart

from such obvious inaccuracies, the early European idealisation of India is a legacy of the ancient Greeks. They attributed to Indians great virtues, extraordinary beauty and longevity, benevolence, a highly developed sense of justice, piety and kindness, largely because they did not face any malice or pettiness from the populace, despite the cruelty and violence of most of Alexander's battles.

The rise of Christianity caused Europe to retreat into a cocoon. Thereafter, Buddhist pilgrims who traversed the land between the fourth and the eighth centuries, visiting the major monasteries and sites consecrated by the presence of the Buddha, to study and acquire authentic copies of the scriptures, wrote significant accounts spanning a range of subjects. This uninhibited intellectual and spiritual exploration of India's *sanskritic* culture and way of life came to an abrupt end with the rise of Islam in Arabia in the seventh century, and its outward thrust into Europe, north Africa, central Asia and the Indian sub-continent, where it fought to establish political and religious supremacy.

India's hoary visitors

The Phoenicians[9] were probably the first Mediterranean peoples to explore the Arabian Sea and import Indian products as early as 975 BC. Hiram, king of Tyre, reportedly sent his fleet from Ezion Geber at the Gulf of Aqaba in the Red Sea to obtain 'ivory, apes and peacocks' from the port of Ophir[10] to decorate the palaces and temples of King Solomon. These are generally regarded as Indian products. The Arabian Sea, named Erythraean Sea by the Greeks, linked India to west Asia via the Persian Gulf, probably from the time of the Indus Valley civilisation. Another sea-route to south Arabia at the Red Sea-Arabian Sea junction most likely opened up in c. 1000 BC, when the Sabaens or Himyarites[11] set up cities in southern Hijaz and Hadramaut. Herodotus said the Egyptian ruler Necho (c. 610 BC) sent ships with Phoenician sailors into the Indian Ocean (i.e. Arabian Sea) through the Persian Gulf. Around the same time, Hanno, a Phoenician admiral of Carthage, sailed to India.[12]

Indian philosophy and wisdom captivated the outside world, and there was early contact between Indian and Greek philosophers. Pythagoras (c. 580

BC) and Histaspis, father of the Persian king Darius, reputedly visited India to study philosophy. Some of the authors who virtually shaped the early Mediterranean view of India include:

1. Skylax of Karyanda (also Caryanda), Greek historian and geographer of the sixth century BC. He wrote the first account by a traveller when sent to explore the Indus from Kaspatyros by the Persian king Darius I, who wanted to annex the lower valley of the Indus. He sailed down the Indus to the sea and westward to the Red Sea. His account can be traced in fragments recorded by later writers, which mostly concern legends about India.

2. Hekataeus of Miletus. His *Geography* mentions some Indian names: Indoi, Indus, Kallatiai, Argante, Gandarii, Kaspatyros, and Opiai, a people of the Indus.

3. Herodotus (489-425 BC), *History*.

4. Ktesias (also Ctesias, 489-425 BC) the Knidian, a contemporary of Hippocrates. His *Indika*, written while serving as royal physician at Persia, is a cocktail of fact and fiction, though he confirms Herodotus' documentation of Indian merchandise, merchants, and envoys, thereby signifying regular traffic by land and sea routes.

India's legendary wealth enticed Alexander. Marching through Persia and Afghanistan, he crossed the Jhelum and the Chenab, but could not proceed beyond the Beas as his soldiers and officers became nervous and edgy over the unexpected and sustained ferocity of native resistance. Splitting his forces at the southern mouth of the Indus, he led one part by land and entrusted the other to Nearchus to explore the route to the mouths of the Tigris and the Euphrates. Alexander believed the ocean was nearby as the 'Indian Gulf' (Arabian Sea) formed "one stretch of water with the Persian Gulf, and the Hyrcanian Sea (Caspian Sea) with the Indian Gulf. From the Persian Gulf our fleet shall sail around to Libya, as far as the Pillars of Heracles (Straits of Gibraltar)" [*Anabasis Alexandri,* v. 26.1-3].

Nearchus, a native of Crete, raised and educated at the Macedonian court along with prince Alexander, chronicled his master's invasion of India in 326 BC, along with an account of the perilous voyage to which he owes his

place in history. The sources diverge sharply regarding the total strength of the fleet. Arrian speaks of two thousand vessels; Diodorus of one thousand; in the *Indika* Arrian mentions 800, manned by seafaring communities like the Phoenicians, Cypriots, Carians and Egyptians who served in the army.[13] Nearchus' memoirs, like other early Greek works of the era, are lost; some portions have percolated down to us through the works of Strabo and Arrian (second century AD).

Alexander's retreat is said to have fortified trade routes as he appointed local governors in the provinces through which he marched. His geographers and historians strove to make detailed and accurate reports about their passage in the region. Amyntas' measurements of the daily marches were confirmed by Megasthenes when he visited Chandragupta Maurya at Pataliputra. The geographers found that Indians had a precise knowledge of their land,[14] and thus garnered information about towns, rivers and mountains far beyond the army's ingress. In the division of empire after Alexander's death, Nearchus received Lykia and Pamphylia, which he ruled under the overlordship of Antigonos. The year of his death is unknown; he last finds mention in history in 314 BC.

The geography of the world, particularly of Persia, was of immense interest to the Greeks. They believed that the largest rivers originated in the greatest mountain ranges, and hence regarded the Hindukush as the greatest watershed in Asia from which all rivers, including the Indus, flowed. At the time of Aristotle, Alexander's teacher, there was a raging debate over the flooding of the Nile. The Greeks believed the Red Sea was an enclosed body of water and the Nile flowed southwards and joined the Indus, which also emptied its waters into the Southern Ocean.[15] They maintained that due to this purported connection between the Indus and the Nile, India's monsoon rains triggered the flooding of the Nile in Egypt.

The Greeks made their second attempt at direct contact with India when King Euergetes II of the Ptolemy dynasty of Egypt deputed Eudoxus (115 BC) with a shipwrecked Indian sailor. The two successfully negotiated a round trip of the Malabar coast, returning with a rich harvest of spices and precious stones, which Euergetes seized for having financed the voyage. The hapless Eudoxus set sail again, only to vanish from the radar of history. The knowledge gleaned from these voyages was lapped up eagerly by the

geographers, especially in Alexandria. Working there in the third century BC, Eratosthenes struggled to understand the world on the basis of scientific concepts; the evidence suggests his depiction of India was truer than Ptolemy's four centuries later. Claudius Ptolemy's *Geographia* was translated into Arabic in the eighth century, but we do not know if he made any maps as none have been found. He erred in giving India an east-west coastline; the Chinese knew it was a peninsula.

Envoys to Palimbothra (Patna), such as Megasthenes from the Greek ruler Seleucus I (c. 305 – 304 BC), Deimachus from the Syrian court, and Dionysius from the Egyptian, wrote about India. The Seleucid Empire covered Mesopotamia, northern Syria and western Iran; trade with India was by both land and sea and included items such as teak, spices, jewels, incense, costus (a medicinal plant, Sanskrit *kushtha*) and cinnamon.[16] The envoys gathered information about India's location relative to other countries, her boundaries and shape, length and breadth, physical features, wealth, the character of the people and the nature of their social and political institutions. Most of their data pertained to north India, though the Greek envoy travelled more widely and meticulously collected material for his magnum opus, *Indika*, which became a major sourcebook for subsequent writers. Megasthenes' facts were sometimes mistrusted by writers like Strabo, and as the original is lost, it is difficult to judge the merits of their doubts. R.C. Majumdar felt his recreated corpus suffers from grave deficiencies and deserves only cautious acceptance, as we shall see later.

Megasthenes arrived in India in 302 BC and penned what is generally held to be the first dated account of the times. India ran a lucrative sea-trade with the Persian Gulf ports of Mesopotamia and the Red Sea ports of Egypt. The principal land route was the caravan trail from Taxila to Balkh. A few decades later, Chandragupta's grandson, Asoka, sent monks to Greece and Egypt to spread the message of Buddha. Preceptors were also sent to Sri Lanka, southeast Asia, China, Tibet and Mongolia, stimulating a sharp rise in visitors from these regions, compelling later rulers to keep track of the movements of foreigners.

By the time the Romans became the predominant power in the Mediterranean, the region had a roaring sea trade with India. The Romans

set up trading stations along the west coast, as evidenced by the discovery of their coins. So great was the flow of silver and gold from Rome that Pliny protested in the Senate against Rome's one-way trade with India; but India had no use for any Roman produce.

Indian merchandise reached the port of Berenike (also Berenica)[17] on the Red Sea. History credits Egyptian navigator Hippalus with unravelling the secret of the regularity of the monsoon winds and being the first foreigner to sail directly across the Arabian Sea to Mouziris (Cranganore)[18], though Indian sailors were obviously using the monsoon currents much earlier. Pliny said boats left Berenike in mid-summer and sailed to the mouth of the Arabian Gulf, after which they took another forty days to reach Mouziris. Alexander's contemporary, Strabo, witnessed 120 ships sailing from Myos Hormos[19] on the Egyptian coast to India.[20]

The return trip began in December, under a north-east wind, till the boats entered the Arabian Gulf and met with a south or south-west wind. This made a round trip possible in the course of a year. The *Periplus of the Erythraean Sea*, written in the mid-first century AD, gives a detailed account of the voyage and the goods traded at each port. The *Periplus* refers to several navigational techniques that enabled sailors to identify the approaching coast by observing changes in the colour of the water and the presence of sea-snakes. As sailing in the Indian Ocean was determined by the cycle of the monsoon winds, the correct interpretation of natural phenomena was critical for success at sea.[21]

Susan Gole[22] says there must have been several sailors' manuals in this period, though the *Periplus* is the only one concerning India which has survived. It provides the first detailed description of local boats in the Indian Ocean in the early centuries CE. On India's south-west coast, the *Periplus* describes the *sangara*, large dugout canoes held together by a yoke, and the huge *kolandiophonta* that sail across to Chryse and the Ganga region (section 60). Pliny refers to 'canoes made of hollowed tree-trunks' used to transport pepper from the district of Cottonara to Becare in south India (*Historia Naturalis* VI. xxvi. 104-6).[23]

A modern copy of a manual in the Kutchi dialect of Gujarat survives, but nothing is known of its origins. The early Indians were inveterate travellers by land and sea, and it is quite remarkable that no sea charts have survived as it appears logical that sailing directions would have been written down and followed. Indeed, literary sources indicate the use of charts, the Sanskrit terms being *citra* or *alekhya*, painting or delineation.[24] Buddhaswami's fifth-century text, *Brhatkathaslokasamgraha*, refers to details of a particular sea, direction and place being inscribed on a wooden board with a cover (*samputaka*) and used to locate a lost ship.[25]

Unlike the Greeks, the Romans had no patience with geographical speculation and theory. Their maps of Asia survive in the Peutinger Tables, a twelfth or thirteenth century copy of a map made around the first century AD. Spread across twelve sheets, it is a road map of all principal roads of the empire. The eleventh sheet showing India has few details; what is pertinent is that it is based on information different from that available to Ptolemy.[26]

Post-Christian era writers relied mostly on secondary sources and lacked personal knowledge. The author of the *Periplus of the Erythraean Sea* probably visited the seats of commerce on the western seaboard and collated information for the benefit of Greek merchants and traders on the route between Egypt, India and East Africa. His text is in *koine* Greek, a dialect easily understood by merchants and traders, and enumerates the coasts to be avoided along with the major landfalls: "to set a course along the coast of Arabia is altogether risky, since the region offers poor anchorage, is foul with rocky stretches, cannot be approached because of cliffs, and is fearsome in every respect" (section 20).[27]

Kosmas (also Cosmas) Indikopleustes (Indian voyager), a merchant who later became a Christian monk (probably Nestorian), was in western India and Ceylon (Sri Lanka) from 535 to 547 AD, and seems to have visited the Malabar coast. His *Topographia Christiana* describes India's trade with Sri Lanka and countries berthing at its southern coasts. The Tamils had already made a mark trading in pepper, pearls and beryls, which drew merchants from east and west. The *Periplus* and *Topographia* contain a wealth of information garnered from traders, travellers visiting India, envoys from

India to the emperors at Rome or Constantinople, and from Indians themselves settled in Alexandria.

No significant travelogue exists between 302 BC and 535 AD, though some secondary historical accounts appeared. The Greek ruler of Egypt, Ptolemy Philadelpus (285-247 BC) sent Dionysius as envoy to the Maurya ruler Bindusara. Greeks from Egypt were frequent visitors to India in the third century BC; Greek names for certain items of common use came to resemble their Tamil equivalents. Claudius Ptolemy, Alexandrian astronomer, mathematician and geographer, drew a map of India, which was published in 1475.[28]

Maritime commerce with China

India's maritime commerce with China goes back to 680 BC when her merchants sailed eastwards, marketing Indian products such as rubies, pearls, and sugar. They set up Indian colonies in Pegu, Cambodia, Java, Sumatra and Borneo and trading settlements in southern China and the Malayan peninsula. In the first century BC, the Kushans of the Yueh-chi tribe settled in Bactria began to press into India and it was during their rule that Indian sages made inroads into China. The earliest reference to India in Chinese works dates from the second century BC and speaks of *Yan-tu* or *Yin-tu*, meaning Hindu, and *Shin-tu* meaning Sindhu. After Hiuen Tsang's extensive travels in the mid-seventh century, maps were made in China to illustrate his book, the *Si Yu Ki*. These divided India into five parts, hence the reference to *Five Indies* or *Gotenjiku Zu*.

Chinese pilgrims coming to India to pay homage at the sacred Buddhist sites and to procure copies of manuscripts of the Buddha's teachings had a clear idea of the shape of the country. Fa-hien, the first important monk to arrive, began his journey by land in 399 AD, via the south of the Gobi Desert and Yarkand, and entered India through the Indus Valley. Besides the central Asian route, there were two other overland routes from China to India. The one through Yunan province, Upper Burma and Assam was not commonly used; the other was through Tibet and Nepal. Fa-hien spent a decade (AD 401?-412?) in northern India, living for three years in Pataliputra. He arrived during the reign of Chandragupta II. Though primarily concerned with the study of Buddhism, accomplished at

Pataliputra, he described many cities, rulers and other interesting facts in his narrative. He noted that India is narrow towards the south and broad towards the north, like the faces of its people.

These early Buddhist pilgrims endured great hardships of travel and communication in their ardent desire to understand Buddhist theology and ritual. Their writings are more lucid than those of the classical authors, but by no means exempt from similar gullibility.

Exceptions to this malady include I-tsing who focused upon the purity of Buddhist ritual and the life sketches of Chinese and Korean monks visiting India around the time of his own stay in the country, and the somewhat pedantic Korean Hye Ch'O (Chinese, Hui Chao), who arrived when the armies of the new faith of Islam were cutting through central Asia. Though historically important, Hye Ch'O's work survives only in the form of a fragment, which suffers many deficiencies, but as it is little known outside the world of scholars, we have deemed it appropriate to reproduce it in full for the benefit of the general reader.

Alexander: Curiosities of a well chronicled story

Any narrative about ancient India's foreign chroniclers necessarily begins with the audacious ingress of the Macedonian king into the region, and his unceremonious withdrawal from the shores of the Beas. Although there is evidence of cultural and commercial exchanges between India and the regions of the Arabian Sea and Persian Gulf prior to Alexander's advent, western historians have insisted on giving the king the credit for opening India up to the western world. The youthful Alexander has cast an enduring spell upon Western literary and historical traditions. His pronounced sense of his place in history led him to take his own historians along on his conquest; they in turn depicted him in a manner consistent with the expectations of a Greek audience, even if this involved taking some liberties with truth. In this sense, his expedition was simultaneously as much mythical as it was factual.

The prevalent Greek historical tradition of the time may well explain the curious discrepancies in the accounts of history's most famous invasion. The Greeks maintained copious records from very early times, and Alexander himself wrote lengthy epistles to his mother. His admiral Nearchus, master pilot Onesicritus, geographer Aristobulus, and general

Cleitarchus penned what were purported to be eye-witness accounts of the various battles of the Indian campaign. Subsequent Greek scholars regarded the narratives of Onesicritus and Cleitarchus as untrustworthy, though Arrian accessed Aristobulus' work.

Despite Alexander's precautions, the earliest surviving histories of his conquests originate in the Roman Empire only three centuries later, in response to new political needs. They begin with Diodorus Siculus' *Bibliotheke*, a universal history; Plutarch comes more than a century later, when Rome was the ascendant power in the Mediterranean.[29] The works of Arrian, Strabo, Curtius Rufus, Justinus, and the unknown author of the *Itinerarium Alexandri Magni*, written for the guidance of Emperor Constantius II in his war against Persia, reputedly rest upon the original accounts of Alexander's own scribes.

Contemporary scholars are reappraising the hitherto accepted legends regarding Alexander's Indian conquest. The influence of the Macedonian encounter on Indian culture, followed by Greek settlements in Bactria and its environs, is being subjected to fresh scrutiny in the light of new research. Hitherto, the sources regarding Alexander's successes were mainly textual, in the form of chronicles, letters (some of dubious value), myths, and above all, colonial interpretations of their historical significance. Archaeological excavations over the past decades, however, have yielded coins, inscriptions, and the remains of settlements, which are being scrupulously analysed. What emerges is a view that Alexander, and later the Indo-Greeks, were confined to the periphery of Indian polity and culture, and hence failed to impact upon the larger Indian consciousness.

Historians have generally agreed that the campaigns in Bactria and India were brutal and tough, and the purported victory against king Porus his greatest military success. At Hydaspes (Jhelum), Alexander faced a numerically superior foe; Greek writers show great deference towards Porus, portraying him as an impressive warrior, five cubits (over two metres) tall, handsome, proud and magnificent astride his war elephant. When the battle was lost, he did not flee the carnage in the manner of Darius the Great King, but continued to fight with his troops until, wounded on the right shoulder and weak from loss of blood, he finally turned away.

Impressed at his heroism and grandeur, Alexander wished to save his life and deputed his lieutenants to bring Porus to him.

Both the battle and the daring strategies which gave Alexander the upper hand in the contest have been diligently examined by scholars. There are many inconsistencies in the accounts that have come down to us, though the generals Aristobulus and Ptolemy, as also the garrulous Coenus, were supposed to have been present. Plutarch claimed his version was based on Alexander's description of the battle in his letters. Arrian simply recorded the differing versions of Aristobulus and Ptolemy though, as a younger contemporary of Plutarch, he would have been aware of Alexander's letters, which may reasonably be considered the definitive version of the encounter, and it is certainly curious that Arrian neglected to refer to them. There are similar variations in narratives regarding Porus' defence, capture, and speech before Alexander. Hence modern scholars doubt the Greek version of this battle; all surviving accounts have been written many centuries after the event.

According to the conventional narrative, Porus fought valiantly, and when finally defeated, met the conqueror with remarkable equanimity and grace. On being asked by the victor how he would like to be treated, he famously responded: "Treat me, O Alexander, in a kingly way!" Awed, the conqueror reinstated Porus as king of the Pauravas, adding substantially to his realm,[30] truly a kingly way, and Porus became a loyal friend.

Scholars now doubt if Porus, who emerged from the conflict with a significantly enlarged kingdom, truly came off worst in this martial engagement,[31] especially as Alexander soon thereafter withdrew from India. Having entered the country with 120,000 men and 15,000 horsemen, he withdrew with barely a fourth of the force.[32] Greek accounts of battles with other heroic tribes, particularly during the retreat when no territorial gains were to be made, depict large-scale mayhem with the burning of cities and massacre of the populace and large-scale taking of prisoners. This suggests that Alexander may have faced unremitting hostility from the native tribes, and probably had to fight to clear a passage back home, a situation at variance with the nobility of his encounter with Porus.

Undeniably, India stripped Alexander of his halo of invincibility. The Greeks had some awareness of India's fighting prowess even before

Alexander marched eastwards to vanquish the Persian king Darius III in 331 BC, avenging Greece's previous defeat by Xerxes in 480 BC. Herodotus mentions an Indian (Pathan) contingent that fought at Plataea in 479 BC during Xerxes' invasion of Greece. After Alexander subdued Bactria (modern Turkestan) up to Amu Darya (river Oxus), he crossed the Hindukush in spring 327 BC and engaged with fearsome tribes from a base near modern Kabul. The following year he crossed the Indus and received a cordial reception from the Taxila ruler (near modern Rawalpindi), who had turbulent neighbours. Thereafter, he reputedly defeated Porus (Puru), whose kingdom lay between the Jhelum and the Chenab, before proceeding to the banks of the Beas.

At this legendary spot, at this poignant hour in the political destiny of India, the triumphant Greek army famously mutinied and refused to advance further to combat more puissant warriors for uncertain gains. Greek authors recount Alexander's desperate pleas to his soldiers to quickly complete the remaining wars in the country as its principal power (Porus) stood vanquished and the fabled wealth of the East lay in the lands just beyond, compared to which the bounty from the Persians appeared niggardly. Offering generous bribes, the king promised they would now fill their personal coffers and the whole of Macedonia and Greece with pearls, precious stones, gold, and ivory.[33] Coenus refuted this contention, eloquently enumerating the formidable forces awaiting them across the shore. Coenus' speech – which hardly sounds like the voice of a general of a triumphant army – has also suffered from contradictory reportage. Curtius stressed the distress of the soldiers; Plutarch did not mention it. Diodorus emphasised the 'utmost misery' of the soldiers and Alexander's attempt to placate them by permitting them to plunder[34] and bribing their wives and children.

The subsequent abrupt exodus of the supposedly victorious Greeks has been projected as Alexander's concession to spare his army certain decimation in the arid Indian summer. Whatever the true reason, it cannot be disputed that India was the only land to stop the world conqueror in his tracks by the steadfast resistance of courageous tribes and tiny republics.

Modern scholars view the 'great army' that struck fear in the hearts of the Greek warriors as a diplomatic ruse, as the great historical Indian empire

(the Maurya) did not rise until after Alexander's departure, and that too, in distant Magadha. It is probable that the war elephants that terrified the Greeks were those of Porus,[35] and that the Greek warriors were simply worn out fighting the puny but fierce tribes they encountered all the way after leaving Persepolis, with no commensurate benefits in the form of war booty, thereby exhausting even the gains made in Persia.[36] This may explain Alexander's insignificant impact on India, particularly in the Gangetic plain where new powers were rising, with the result that there is no reference to him in Sanskrit literature. However, the labours of successive Greek historians under the Roman Empire centuries later perpetuated his legend in the Greek, Roman and later even Arab, Persian and European worlds. Alexander's memory was still throbbing in the early centuries of the Christian Era when Philostratus' semi-fictional account of the travels of Apollonius of Tyana shows him visiting Porus' temple where he claims to have seen bronze reliefs of Alexander's feats.[37]

The king retreated via the Indus, devastating all he encountered en route, before finally reaching Susa in Persia in May 324 BC. He died the subsequent year, and by 317 BC, the last vestiges of Greek authority in the Punjab had vanished. Babylonian ruler Seleucus Nikator's attempt to seize Alexander's Indian provinces in 306 BC was rebuffed, and in a treaty the subsequent year, he ceded Kabul, Kandahar, Herat and modern Baluchistan to Chandragupta, in return for 500 elephants.

Modern scholars challenge the veracity of Greek sources in establishing a dependable chronology of Indian history. They view Greek 'reliability' as a colonial legacy, worthy of scrutiny. The early British quest for the Greeks was less a 'scientific' inquiry into India's archaeological heritage and history and more a search for the beginnings of Empire, which the British perceived themselves as inheriting from the Greeks.[38] Similarly, they question the true extent of Alexander's legacy in north India, particularly in the use of Greek as a language of culture, as was the case with Persian in the medieval era.

Percival Spear exemplifies the colonial mindset when he claims Alexander's lasting importance lies in the opening of viable routes between India and the West; his fleet proving the potential of the sea route; his army

the land route via Kabul, Mulla Pass and Baluchistan. These were kept open for two centuries by the Hellenistic Age that followed his advent.

Jean-François Salles counters that Nearchus' voyage, for all its grave dangers and grim privations, was *an escape from India* and not an approach to India. Its principal purpose was to accompany and assist Alexander's return by land, while also sometimes exploring this 'new' region. It is pertinent that Nearchus' records[39] contain hardly any nautical information, at least in Arrian's excerpts. Yet this Alexandrine scheme of entering India via the Hindukush and returning via the Persian Gulf gripped the imagination of Greek writers and was replicated in the third century AD in Philostratus' *Life of Apollonius*, though the sage's adventures supposedly took place in the first century AD.[40] This formula lends credence to the belief that Indian sailors may have assisted Nearchus' journey.

According to his historians, Alexander was keen to personally navigate the whole circuit of the sea from India to Persia. He feared only the length of the voyage and the possibility that the fleet may be marooned on a coast without harbours or proper supplies, thus ruining his hitherto good fortune and reputation for success, which the Greeks were loathe to admit had been tarnished by a puissant and irreverent India! Yet Alexander instantly faced difficulties in finding a commander with the nerve for adventure and glory, and the ability to execute his (Alexander's) plans. Nor was it easy to persuade the Greek soldiers to overcome their fears of the hazardous expedition and mount the ships.[41]

Nearchus offered to lead the expedition to Persia if the sea proved navigable and the journey "within the power of man to perform." In the absence of other volunteers, Alexander had no choice, despite his reluctance to place such a close friend in danger. Nearchus set off when the Etesian winds which inhibit summer navigation subsided, in the year when Kephisidoros was the Archon at Athens.

Arriving months later at Susa, they received Alexander's returning army and celebrated their safe return with gusto. The almost simultaneous arrival of the fleet and the army at Susa vindicates the view that the voyage was conceived as a safety valve to protect a portion of the Greek army from India's indomitable tribes. The fact that the retreating Alexander, having abandoned his dream of world (certainly of Indian) conquest, had to engage

in several intense battles on his way back home, suggests that besides the climate and the terrain, the natives tormented him every inch of the way. Alexander's Indian experience can be pithily summed up in the philosopher's query to Onesicritus: "For what purpose has Alexander come all the way hither?"

Percival Spear says that Alexander introduced Persian influences into India. He conquered the highly developed and complex Achaemenid empire, and he and his Seleucid successors adopted and adapted its institutions. The Mauryan empire that rose after his departure resembled Persian and not Greek models. The Kharosthi in Asoka's (273-232 BC) inscriptions is closer to Aramaic than Greek. Still, it is generally held that Alexander and later the Seleucids settled large numbers from the Greek world in this region.

Megasthenes

It would be appropriate to reappraise the entrenched legacy of the celebrated Megasthenes, who enjoys unique status among India's early historiographers. The Greek envoy's depiction of occupation-based castes and other social customs have so dominated academic discourse and popular imagination that some obvious deficiencies in the corpus that has come down to us have, as R.C. Majumdar protests, failed to receive the attention they deserve. Megasthenes was deputed as envoy to Sandrocottus, generally identified with the Mauryan Emperor Chandragupta (though some academics believe the issue is far from settled). By all accounts, he resided at Palimbothra (Pataliputra, modern Patna) and frequently called upon the Indian ruler. Whatever the length of his stay in the country, he appears to have come to India only once. He had also met Porus and rated him higher than Sandrocottus/Chandragupta.

Megasthenes owes his enduring fame to his book, *Indika*, which later writers freely accessed for information on India. The *Indika* has not survived, and our own knowledge of Megasthenes rests on passing references by Strabo, Arrian, Pliny and Clemens Alexandrinus, which indicate that he lived with Seleucus Nicator and Sibyrtius, satrap of Arachosia. Majumdar says there is ambiguity about the dates of his arrival and the duration of stay in India, though he probably arrived just before 300

BC, after the treaty between Chandragupta Maurya and Seleucus Nicator, founder of the Seleucid dynasty and empire.

The Indian system of social organisation made a deep impression upon the Greek envoy. Yet his listing of seven castes was inaccurate, though it is unclear if the mistake was made by Megasthenes or by successive writers who claimed him as their source. The German scholar Schwanbeck prepared a 'critical edition' of the *Indika* by collecting all fragments based on Megasthenes; the English translation was by J.W. McCrindle. Majumdar questions the merit of this exercise as the selected '*Fragments'* fall into four categories, viz., passages other writers specifically attributed to Megasthenes; passages closely resembling the former but not specifically attributed to Megasthenes; passages preceding or following these two categories; and long passages falling in one of the three groups, including incidental notices. He opines that while the first two types of passages can with some justice be ascribed to the *Indika*, this may not apply to other selections.

Defending his thesis, Majumdar says that the first Fragment, from *History of Diodorus* (II 35-42), which Schwanbeck designated "*An Epitome of Megasthenes*," spans over fourteen printed pages without once mentioning the Greek envoy. Equally suspect, he says, is Diodorus' claim that Alexander advanced as far as the Ganga. As Megasthenes was of the same era as Alexander and resided at Pataliputra on the banks of the Ganga, maintaining close affinity with the ruler and the populace, he would surely have known the limits of Alexander's advance. Strabo records that Craterus wrote to his mother that Alexander marched as far as the Ganga; hence it is probable that Diodorus gathered his faulty data from Craterus or others, rather than Megasthenes.

Strabo acknowledges referring to Megasthenes and others; Majumdar believes Diodorus also accessed other works. Had he relied solely or even principally upon Megasthenes, he would certainly have cited him for authenticity. As C.H. Oldfather, Diodorus' English translator notes: "It cannot be known whether Diodorus used Megasthenes directly or through a medium; his failure to mention his name a single time is a little surprising, if he used him directly" (*Diodorus of Sicily,* English trans., 1935).

Diodorus in fact often departs from Megasthenes. He claims the breadth of India from east to west is 28,000 stadia; Megasthenes speaks of 16,000

stadia (a point on which Schwanbeck and McCrindle concur). A differential of 75% in measurement between a book and its supposed archetype raises legitimate doubts. Diodorus further asserts that the Indus may be the largest river in the world after the Nile, but Arrian quotes Megasthenes to say the Ganga is much larger than the Indus. Interestingly, McCrindle's *Fragment II* observes that the Nile and the Danube together do not equal even the Indus, let alone the Ganga (M-II, 47). Majumdar concludes that Fragments I and II cannot originate from the same *Indika*; yet both have been uncritically accepted as such by Schwanbeck and McCrindle.

Schwanbeck's *Fragment XXVII* comprises four paragraphs from Strabo (53-56), held to derive from Megasthenes. Yet Strabo only thrice cites Megasthenes as his authority for three isolated statements (one each in paras 53, 54, and 56), though he covers myriad topics. As Strabo did refer to several sources and often cited them, it cannot be presumed he relied solely on Megasthenes for all information included in a single para or consecutive paras which mention the envoy. If *Fragment XXVII* derived solely from the *Indika*, three specific citations of Megasthenes for three separate statements would be redundant; most likely only those three statements derive from him.

Some mistakes are conspicuous. Strabo cites Megasthenes while describing seven castes (Paras 39-41 and 46-49 of *Fragment XXXIV*), but digresses to discuss wild animals (Paras 42-45 of *Fragment XXVII*) before returning to the theme of caste. It is possible to view the discussion on wild animals as an auxiliary note to para 41 on the third caste of shepherds and hunters, as they deal with animals. At the end of Para 45 Strabo says, "Let me now return to Megasthenes and continue his account from the point where I left it."

Para 49 relates to the seventh caste, whose members held the chief offices of State. The succeeding Paras 50-52 describe the officers without once alluding to Megasthenes, yet they are presumed to rest on *Indika*. Further, while describing the third caste of shepherds and hunters, Strabo strays into a long thesis on elephants and other animals, based on "both Megasthenes and others". Hence, the additional note on the seventh caste cannot be blindly accepted as sourced from *Indika*, though Strabo does not explicitly say it derived from other sources. As Strabo and Diodorus differ

significantly in details about the second, fourth, and sixth castes, both can hardly have relied only upon Megasthenes for their facts.

Majumdar notes that the reference to Municipal and Military Boards of administration in the narrative on the seventh caste has led many scholars to doubt if Kautilya's *Arthasastra*, which is silent about such bodies, was actually written in the reign of Chandragupta Maurya. He advises caution while invoking Megasthenes on any issue where his name is not specifically cited.

Besides, Megasthenes was by no means the sole source of information about eastern India. Arrian avers: "a few authors have described the country as far as the river Ganges and the parts near its mouth and the city of Palimbothra." Majumdar laments that Schwanbeck simply assumes that the *Indika* was the most exhaustive account of India and that later classical writers trusted it so much that one could presume they sourced their work wholly from Megasthenes, unless specifically stated otherwise. This is despite Schwanbeck being aware that writers like Eratosthenes, Strabo, Arrian and Pliny were wary of Megasthenes and his *Indika*.

Arrian observed that Megasthenes insisted that the story of gold-digging ants was true, though he could not verify it. Schwanbeck pleads that Megasthenes accurately recorded all that he himself observed as well as what was told to him by others. Majumdar retorts that as Megasthenes clearly lacked the faculty of discrimination, one must be prudent while assessing his accounts. His blind acceptance of the most unnatural phenomena and incredible tales about men and animals adds weight to this warning.

Other writers were hardly flawless. Strabo claims that Megasthenes said Indians were ignorant of the art of writing, but simultaneously quotes a testimonial by him to the effect that Indians knew writing![42] Strabo quotes Nearchus that Indians wrote on linen cloth, while Curtius mentions the use of the barks of trees for writing in Alexander's time. In fact, Indians were quite adept in writing as can be seen from the subsequent rock and pillar inscriptions of Chandragupta's grandson Asoka; the well-formed letters of the script indicating a long gestation period of many centuries. The implications of the use of writing are significant as writing is a critical technology of the intellect. It facilitated the organisation of complex tasks

such as sorting and storage of information under numeric and alphabetic heads, use of charts and maps, and stimulated art and culture.[43] Of course, all Greeks without exception were enchanted by the Brahmins and *Sramanas* (Buddhist and Jaina ascetics), and made strenuous attempts to understand the Hindu doctrine of the immortality of the soul.

Overall, the evidence suggests that the classical writers were prone to error owing to a poor understanding of the country and society, and a tendency to generalise on the basis of isolated facts, such as the contention that there were no slaves in India. Ancient *Smritis* and literature mention slavery; the *Arthasastra* classifies slaves and details their rights, disabilities, and terms of release. Majumdar believes this inaccuracy derived from a mental comparison between the depressed condition of slaves in Greece and Rome, while Indian slaves seemed comparable to domestic servants.

*

The core question concerning Alexander's intrusion into north-west India is whether it had a lasting significance in Indian history. The king is reported to have settled a large number of Greek mercenaries in regions north of the Hindukush, though here again the figures differ. Arrian (IV.22) mentions 13,500 soldiers in the Oxus valley, while Curtius says another 4,600 were left in Arachosia (VII.3-4). Besides, there were the pensioned soldiers settled in newly founded towns; Alexander reputedly founded seventy Alexandrias.[44] After his death in 323 BCE, Seleucus I (Nicator) and the Indo-Greeks introduced Greek populations in the area, but their impact on the language and culture of the natives was negligible. The Greek influence in the Indian north-west (including present day Afghanistan and Pakistan) was best reflected in Gandhara art, in the form of Buddha's robes; his posture; Vajrapani in the form of Heracles; mythological figures such as satyrs, Corinthian columns, and other decorative elements.[45]

To our modern sensibilities, the history of our ancient past appears as a fable, hazy and incomplete. Before we turn to our extracts, it would be in order to mention the inadequacies in the present work. The compiler is not acquainted with the Greek, Latin, Chinese or Korean languages, and has relied solely upon standard English translations. The compilation is offered in as accurate a chronological sequence as possible, with fragmentary references placed at the end of the section on classical writers, in order to

complete the narrative while reflecting the incomplete nature of our materials. The choice of passages is based upon a perception of what will interest the general reader thirsty for knowledge about the past, in a compact and accessible format. This has necessitated drastic pruning of available materials,[46] as our purpose is not to relive the travails of the weary travellers of yore, but to highlight the extant social, political, religious, cultural, commercial and geographical reality of that era, captured by quill pen and ink by amateur biographers, either deeply or tangentially, according to their individual abilities and perceptions. We have, as per convention, retained the original spellings of the author or translator, and for convenience of style avoided use of diacritical marks, opting instead to italicise Indian words. Special thanks are due to Ms Rekha Gupta who painstakingly checked the manuscript for errors; needless to add, all errors and shortcomings are the sole responsibility of the compiler.

We conclude with illuminating excerpts about the Brahmin dynasty that built Angkor Vat in Kampuchea (Cambodia), and the Ayodhya princess who married into the royal family of Korea. Although these are not, strictly speaking, by foreign writers who visited India in our chosen epoch, we feel they round off the narrative and would enchant the reader. At the very end are brief sketches of Chinese and Korean pilgrims by I-tsing, who sought to honour the monks who came in search of the Law and perished far from home. They highlight the volume of spiritual traffic to India in those difficult days.

We have tried to avoid lengthy footnotes or explanatory notes, except to indicate information that adds to the meaning and readability of the narratives. A brief resumé about each author precedes the selected passages, to provide the reader with context and perspective, and it is our sincere hope that this approach will help construct a mental picture of the flowering of India's rich, diverse, and unbroken heritage in the epoch in which she became renowned as the 'golden bird.'

CHAPTER — 1

HERODOTUS

Herodotus, the designated Father of History in the Western tradition, was born between 490 and 480 BC at Halikarnassos, a town in Caria on the south-west coast of Asia Minor (Anatolia of the Greek world), then subject to Persian rule. He died sometime after the outbreak of the Peloponnesian War in 431 BC, at Thurii, a city of Magna Graecia on the Tarentine Gulf, where he penned his famous *History* (or *The Histories*). McCrindle observes that Herodotus had a poor knowledge of India. He knew it was one of the remotest provinces of the Persian Empire towards the east, but had no real notion of its extent and exact location. His work contains the first reference to the legend of gold-digging ants, whose strenuous efforts reputedly produced the huge gold tribute India gave Persia in the reign of Darius. The passages selected below are based on Bohn's *Herodotus* translated by Cary, in the works of J.W. McCrindle and R.C. Majumdar.[47]

BOOK I

India's export of dogs:

192. …. Moreover he (Babylonian governor Tritantaechmes) kept so great a number of Indian dogs that four great villages of the plain were appointed to provide food for the dogs and eased from all other burdens.[48] Such were the riches of the governor of Babylon.

BOOK III

Fabulous tribute to Persia:

97. Darius, son of Hystaspes, set up twenty Satrapies (provincial governorships), and assessed each nation for taxes. (Of these Satrapies) Twentieth: The Indians, the most populous of all the nations in the world, paid the largest sum – 360 talents of gold-dust.[49]

People, language and attire:

98. I will now describe the method by which the Indians obtain the great quantity of gold which enable them to pay the above-mentioned quantity of gold-dust. That part of India towards the rising sun is all sand. Indeed of all the inhabitants of Asia of whom we have any reliable information, the Indians are the most easterly – beyond them the country is uninhabitable desert. There are many tribes of Indians who speak different languages; some of them are pastoral and nomadic, and others not. Some inhabit the marsh-country by the river. The people eat raw fish which they catch by going out in boats made of reeds, – each boat made from a single joint. These Indians make their garment from a sort of rush which grows in the river, gathering it and beating it out, and then weaving it into a kind of matting which they wear to cover their chests, like a breastplate.

Vegetarian ethic:

100. Other Indians have the following different custom: they neither kill anything that has life, nor sow anything, nor are they wont to have houses, but they live upon herbs, and they have a grain the size of a millet in a pod, which springs spontaneously from the earth, this they gather, and boil it and eat it with the pod. When any of them falls ill, he goes and lies down in the desert, and no one takes any thought about him, whether dead or sick.

Gold-digging ants:

102. There are other Indians bordering on the city of Caspatyrus[50] and the country of Pactyice,[51] settled northward of the other Indians, whose mode of life resembles that of the Bactrians.[52] They are the most warlike of the Indians, and these are they who are sent to procure the gold; for near this part is a desert by reason of the sands. In this desert, then, and in the sand, there are ants in size somewhat less indeed than dogs, but larger than foxes. Some of them are in possession of the King of the Persians, which were taken there. These ants, forming their habitations underground, heap up the sand, as the ants in Greece do, and in the same manner; and they are very like them in shape.[53] The sand that is heaped up is mixed with gold. The Indians therefore go to the desert to get this sand, each man having three camels, on either side a male one harnessed to draw by the side, and a

female in the middle. This last the man mounts himself, having taken care to yoke one that has been separated from her young as recently born as possible; for camels are not inferior to horses in swiftness, and are much better able to carry burdens.

104. The Indians then adopting such a plan and such a method of harnessing, set out for the gold, having before calculated the time, so as to be engaged in their plunder during the hottest part of the day, for during the heat the ants hide themselves under the ground. Amongst these people the sun is hottest in the morning, and not, as amongst others, at mid-day.

105. When the Indians arrive at the spot, having sacks with them, they fill them with the sand, and return with all possible expedition. For the ants, as the Persians say, immediately discovering them by the smell, pursue them and they are equalled in swiftness by no other animal, so that the Indians, if they did not get the start of them while the ants were assembling, not a man of them could be saved. Now the male camels (for they are inferior in speed to the females) slacken their pace, dragging on, not both equally, but the females, mindful of the young they have left, do not slacken their pace. Thus the Indians, as the Persians say, obtain the greatest part of their gold; and they have some small quantity more that is dug in the country.

Geography and abundance:

106. The extreme parts of the inhabited world somehow possess the most excellent products; as Greece enjoys by far the best tempered climate. For in the first place, India is the farthest part of the inhabited world towards the east, as I have just observed; in this part, then, all animals, both quadrupeds and birds, are much larger than they are in other countries, with the exception of horses; in this respect they are surpassed by the Medic breed called the Nysaean horses. In the next place, there is abundance of gold there, partly dug, partly brought down by the rivers, and partly seized in the manner I have described. And certain wild trees there bear wool[54] instead of fruit, that in beauty and quality excels that of sheep; and the Indians make their clothing from these trees.

BOOK IV

Darius' expedition to the Indus:

44. A great part of Asia was explored under the direction of Darius. He being desirous to know in what part the Indus, which is the second river that produces crocodiles, discharges itself into the sea, sent in ships both others on whom he could rely to make a true report and also Scylax of Caryanda.[55] They accordingly setting out from the city of Caspatyrus and the country of Pactyice, sailed down the river towards the east and sunrise to the sea; then sailing on the sea westward, they arrived in the thirtieth month at that place where the King of Egypt despatched the Phoenicians… to sail round Libya. After these persons had sailed round, Darius subdued the Indians and frequented this sea.

BOOK VII

Indian warriors in the Persian army of Xerxes:

65: The Indians wore garments of tree-wool and carried bows of reed and iron-tipped arrows of the same. Such was their equipment; they were appointed to march under the command of Pharnazathres, the son of Artabates.

86. The Indians were armed in like manner as their foot; they rode swift horses and drove chariots drawn by horses and wild asses.

187. That is the number of Xerxes'[56] whole armament: but none can say what was the exact sum of cooking women, and concubines and eunuchs; nor of the beasts of draught and burden and the Indian dogs that were with the host, could any one tell the number, so many they were.

❑

.

CHAPTER — 2

KTESIAS THE KNIDIAN

Ktesias (also Ctesias) was the first to give the Greeks a special treatise on India, a region previously known from marginal references in the *Geography* of Hekataios of Miletos and the *History* of Herodotus. Ktesias hailed from Knidos, an important Lacedaemonian colony on the coast of Karia. His father was Ktesiokhos (or Ktesiarkhos), and the family belonged to the Asklepiadai priestly caste, whose hereditary profession was medicine. He was a younger contemporary of Hippokrates (also Hippocrates of Cos, famous Greek physician of the Age of Pericles), but his date of birth is unknown. He must have become famous before 416 BC, when he went to Persia and lived 17 years as physician to the royal court, first under Darius II and then under his successor Artaxerxes Mnemon. He accompanied the latter in battle against Cyrus and cured a wound received in the battle of Kunaxa (V. *Anab*. I viii, 27). He returned to his own country in 398 BC, after which nothing is known of him.

Ktesias had a literary flair and wrote several works, the most important being a history of Persia. He wrote a Treatise on India, *Indika*, which is lost, but was abridged by Photios, Patriarch of Constantinople in AD 858, and other writers. It was based on information gathered from Persian officials travelling to India on the king's service, and from Indians who visited the Persian Court as merchants or envoys bearing presents and tribute from the princes of Northern India, part of which was then subject to Persian rule.

Given his proximity to India, it is inexplicable why Ktesias never visited the land that fascinated him so much, especially since, as royal physician, he had a special interest in medicaments available in India to treat problems like snake-bite, which would have led him to do commerce with the visiting caravans of merchants. The regular traffic between royal envoys and travellers in his time would have made travel safe and reasonably comfortable. Perhaps his royal duties kept him fully occupied. Yet he seems to have found ample time to converse with the foreign guests and indulge his quest for knowledge of this part of the world.

Ktesias' colourful account of the Assyrian Queen Semiramis' ill-fated expedition to India has been dismissed by serious scholars in the absence of

corroborative evidence from other sources. Greek historians like Arrian said she died before reaching India. Yet Ktesias would have us believe that Semiramis butchered 300,000 black oxen, distributed their meat among artisans and workers, had dummy elephants made from the skins, and transported them to India by hiding a camel and rider inside each![57] It is probable that Ktesias merely adapted a version of Homer's famous Trojan Horse to an Indian landscape.

Ktesias was quite susceptible to fantasia; this exasperated ancient scholars who referred to him in the absence of other sources on India. Modern scholars have partially repaired his reputation by concluding that some of his errors, especially regarding fabulous races and incredible animals, derived from confusion regarding stories rooted in the two great epics and other narratives. We have selected extracts that scholars believe possess some academic merit.

FRAGMENT I. ECLOGA IN PHOTII, *BIBL.* LXXII, P. 144 SEQQ.

On the extraction of gold:

4. He notices the fountain which is filled every year with liquid gold, out of which are annually drawn a hundred earthen pitchers filled with the metal. The pitchers must be earthen since the gold when drawn becomes solid, and to get it out the containing vessel must needs be broken in pieces. The fountain is of a square shape, eleven cubits in circumference, and a fathom in depth. Each pitcherful of gold weighs a talent.[58] He notices also the iron found at the bottom of this fountain, adding that he had in his own possession two swords made from this iron, one given to him by the king of Persia (Artaxerxes Mnemon), and the other by Parysatis, the mother of that same king. This iron, he says, if fixed in the earth, averts clouds and hail and thunderstorms, and he avers that he had himself twice seen the iron[59] do this, the king on both occasions performing the experiment.

Dogs, gems, the heat:

5. We learn further that the dogs of India are of very great size, so that they fight even with the lion;[60] that there are certain high mountains having mines which yield the sardine-stone, and onyxes, and other seal stones; that the heat is excessive, and that the sun appears in India to be ten times larger than in other countries; and that many of the inhabitants are suffocated to death by the heat. Of the sea in India, he says, that it is not less than the sea in Hellas; its surface however for four finger-breadths downward is hot, so that fish cannot live that go near the heated surface, but must confine themselves always to the depths below.[61]

River Indus and the giant reeds:

6. He states that the river Indus flows through the level country, and through between the mountains, and that what is called the Indian reed grows along its course, this being so thick that two men could scarcely encompass its stem with their arms, and of a height to equal the mast of a merchant ship of the heaviest burden. Some are of greater size even than this, though some are of less, as might be expected when the mountain it grows on is of vast range. The reeds are distinguished by sex, some being male, others female. The male reed has no pith, and is exceedingly strong, but the female has a pith.[62]

On the people and the worship of the sun:

8. He describes the Indians as extremely just, and gives an account of their manners and customs. He mentions the sacred spot in the midst of an uninhabited region which they venerate in the name of the Sun and the Moon. It takes one a fifteen days' journey to reach this place from Mount Sardous.[63] Here for the space of five and thirty days the Sun every year cools down to allow his worshippers to celebrate his rites, and return home unscorched by his burning rays. He observes that in India there is neither thunder nor lightning nor rain, but that storms of wind and violent hurricanes which sweep everything before them, are of frequent occurrence. The morning sun produces coolness for one half of the day, but an excessive heat during the other half, and this holds good for most parts of India.

9. It is not, however, by exposure to the sun that the people are swarthy, but by nature, for among the Indians there are both men and women who are as fair as any in the world, though such are no doubt in a minority. He adds that he had himself seen two Indian women and five men of such a fair complexion.

11. He writes that in the middle of India are found the swarthy men called Pygmies[64], who speak the same language as the other Indians. They are very diminutive, the tallest of them being but two cubits in height, while the majority are only one and a half…. Of the Pygmies three thousand men attend the king of the Indians, on account of their great skill in archery. They are eminently just, and have the same laws as the Indians.

Silver mines and gold:

12. There is much silver in their part of the country, and the silver-mines though not deep are deeper than those in Baktria.[65] Gold also is a product of India. It is not found in rivers and washed *from the sands* the like gold of the river Paktolos, but is found on those many high-towering mountains which are inhabited by the Griffins, a race of four-footed birds, about as large as wolves, having legs and claws like those of the lion, and covered all over the body with black feathers except only on the breast where they are red. On account of those birds the gold with which the mountains abound is difficult to be got.[66]

Justice and crimes:

14. The justice of the Indians, their devotion to their king and their contempt of death are themes on which he loves to expatiate. He notices a fountain having this peculiarity, that when any one draws water from it, the water coagulates like cheese, and should you then detach from the solid lump a piece weighing about three obols, and having triturated this, put the powder into common water, he to whom you give this potion blabs out whatever he has done, for he becomes delirious, and raves like a madman all that day. The king avails himself of this property when he wishes to discover the guilt or innocence of accused persons. Whoever incriminates

himself when undergoing the ordeal is sentenced to starve himself to death, while he who does not confess to any crime is acquitted.[67]

The health of Indians :

15. The Indians are not afflicted with headache, or toothache, or ophthalmia, nor have they mouthsores or ulcers in any part of their body. The age to which they live is 120, 130, and 150 years, though the very old live to 200.[68]

A dog-headed race:

20. He writes that on the mountains just spoken of there live men having heads like those of dogs, who wear the skins of wild beasts, and do not use articulate speech, but bark like dogs, and thus converse so as to be understood by each other. They have larger teeth than dogs, and claws like those of dogs, only larger and more rounded. They inhabit the mountains, and extend as far as the river Indus. They are swarthy, and like all the other Indians extremely just men. With the Indians they can hold intercourse, for they understand what they say, though they cannot, it is true, reply to them in words, still by barking and by making signs with their hands and their fingers like the deaf and the dumb, they can make themselves understood. They are called by the Indians *Kalystrioi,* which means in Greek dog-headed. Their food is raw flesh. The whole tribe numbers not less than 120,000 men.[69]

Vegetable dyes:

21. Near the sources of this river (Hyparkhos, Pliny says Hypobarus) there grows a certain purple flower, which is used for dying purple, and is not inferior to the Greek sort, but even imparts a far more florid hue. In the same parts there is a wild insect about the size of a beetle, red like cinnabar, with legs excessively long. It is as soft as the worm called *skolex* and is found on the trees which produce amber, eating the fruits of those trees and destroying them, as in Greece the wood-louse ravages the vine-trees. The Indians grind these insects to a powder and therewith dye such robes,

tunics, and other vestments as they want to be of a purple hue.[70] Their dye-stuffs are superior to those used by the Persians.

A tribe of cattle-herders:

22. The Kynokephaloi living on the mountains do not practice any of the arts but subsist by the produce of the chase. They slaughter the prey, and roast the flesh in the sun. They rear however great numbers of sheep and goats and asses.[71] They drink the milk of the sheep and the whey which is made therefrom. They eat moreover the fruit of the *Siptakhora* – the tree which produces amber, for it is sweet. They also dry this fruit, and pack it in hampers as the Greeks do raisins. The same people construct rafts, and freight them with the hampers as well as with the flowers of the purple plant, after cleansing it, and with 260 talents weight of amber, and a like weight of the pigment which dyes purple, and 1000 talents more of amber. All this cargo, which is the season's produce, they convey annually *as tribute* to the King of the Indians. They take also additional quantities of the same commodities for sale to the Indians, from whom they receive in exchange loaves of bread and flour and cloth which is made from a tree-grown stuff (cotton). They sell also swords such as they use in hunting wild beasts, and bows and javelins, for they are fell marksmen both in shooting with the bow and in hurling the javelin. As they inhabit steep and pathless mountains they cannot possibly be conquered in war, and the king moreover once every five years sends them as presents 300,000 arrows and as many javelins, 120,000 shields and 50,000 swords.

23. These Kynokephaloi have no houses but live in caves. They hunt wild beasts with the bow and the spear, and run so fast that they can overtake them in the chase…. That man is considered the richest who possesses most sheep, and in property of this sort consists all their wealth…. They are just,[72] and of all men are the longest-lived, attaining the age of 170, and some even of 200 years.

Wild asses or rhinoceroses:

25. Among the Indians, he proceeds, there are wild asses as large as horses, some being even larger. Their head is of a dark red colour, their eyes

blue, and the rest of their body white. They have a horn on their forehead, a cubit in length [the filings of this horn, if given in a potion, are an antidote to poisonous drugs]. This horn for about two palm-breadths upwards from the base is of the purest white, where it tapers to a sharp point of a flaming crimson, and, in the middle, is black. These horns are made into drinking cups, and such as drink from them are attacked neither by convulsions nor by the sacred disease (epilepsy). Nay, they are not even affected by poisons, if either before or after swallowing them they drink from these cups wine, water, or anything else. While other asses moreover, whether wild or tame, and indeed all other solid-hoofed animals have neither huckle-bones, nor gall in the liver, these one-horned asses have both.[73] Their huckle-bone is the most beautiful of all I have ever seen, and is, in appearance and size, like that of the ox. It is as heavy as lead, and of the colour of cinnabar (vermillion) both on the surface, and all throughout. It is exceedingly fleet and strong, and no creature that pursues it, not even the horse, can overtake it.

Rhinoceros hunt:

26. On the first starting it scampers off somewhat leisurely, but the longer it runs, it gallops faster and faster till the pace becomes most furious.[74] These animals therefore can only be caught at one particular time – that is when they lead out their little foals to the pastures in which they roam. They are then hemmed in on all sides by a vast number of hunters mounted on horseback, and being unwilling to escape while leaving their young to perish, stand their ground and fight, and by butting with their horns and kicking and biting kill many horses and men. But they are in the end taken, pierced to death with arrows and spears, for to take them alive is in no way possible. Their flesh being bitter, is unfit for food, and they are hunted merely for the sake of their horns and their huckle-bones.

On a lethal worm:

27. He states that there is bred in the Indian river a worm like in appearance to that which is found in the fig, but seven cubits more or less in length, while its thickness is such that a boy ten years old could hardly clasp

it within the circuit of his arms. These worms have two teeth – an upper and a lower, with which they seize and devour their prey. In the daytime they remain in the mud at the bottom of the river, but at night they come ashore, and should they fall in with any prey as a cow or a camel, they seize it with their teeth, and having dragged it to the river, there devour it. For catching this worm a large hook is employed, to which a kid or a lamb is fastened by chains of iron. The worm being landed, the captors hang up its carcase, and placing vessels underneath it leave it thus for thirty days. All this time oil drops from it, as much being got as would fill ten Attic *kotylai*.[75] At the end of the thirty days they throw away the worm, and preserving the oil they take it to the king of the Indians, and to him alone, for no subject is allowed to get a drop of it. This oil [like fire] sets everything ablaze over which it is poured and it consumes not alone wood but even animals. The flames can be quenched only by throwing over them a great quantity of clay, and that of a thick consistency.[76]

Perfumes and unguents:

28. But again there are certain trees in India as tall as the cedar or the cypress, having leaves like those of the date palm, only somewhat broader, but having no shoots sprouting from the stems. They produce a flower like the male laurel, but no fruit. In the Indian language they are called *karpion*, but in Greek *muroroda* (unguent-roses). These trees are scarce. There oozes from them an oil in drops, which are wiped off from the stem with wool, from which they are afterwards wrung out and received into alabaster boxes of stone. The oil is in colour of a faint red, and of a somewhat thick consistency. Its smell is the sweetest in all the world, and is said to diffuse itself to a distance of five stadia around. The privilege of possessing this perfume belongs only to the king and the members of the royal family. A present of it was sent by the king of the Indians to the king of the Persians, and Ktesias alleges that he saw it himself, and that it was of such an exquisite fragrance as he could not describe, and he knew nothing whereunto he could liken it.[77]

29. He states that the cheese and the wines of the Indians are the sweetest in the world, adding that he knew this from his own experience, since he

had tasted both.

Mineral wells:

30. There is a fountain among the Indians of a square shape and of about five ells in circumference. The water lodges in a rock. The depth downward till you reach the water is three cubits and the depth of the water itself three *orguiai*. Herein the Indians of highest distinction bathe [both for purification and the averting of diseases] along with their wives and children; they throw themselves into the well foot foremost, and when they leap in the water casts them up again, and not only does it throw up human beings to the surface, but it casts out upon dry land any kind of animal, whether living or dead, and in fact anything else that is cast into it except iron and silver and gold and copper, which all sink to the bottom. The water is intensely cold and sweet to drink. It makes a loud bubbling noise like water boiling in a caldron. Its waters are a cure for leprosy, and scab. In the Indian tongue it is called *Ballade*.[78]

.

CHAPTER — 3

STRABO

Greek geographer and historian, Strabo, was born in Amasia, a Hellenised city and royal residence of the kings of Pontus in Asia Minor. The dates of his birth and death are unknown, but he lived in the reign of Augustus and also when Tiberius ruled in AD 21. Groskurd believes he died three years later. His father's family is unknown, but his maternal relatives who held important offices under Mithradates V and VI were of Hellenic and Asiatic origin. Strabo himself was completely Greek in language and education. Like Herodotus, he was a veteran traveller and had ventured eastwards upto Armenia. He did not visit India, and had a poor opinion of the writings of Nearchus and Megasthenes. His *Geography*, finalised between AD 17 and 23, is hailed as the most important ancient work on the subject, and includes a section (Book XV) on India and Persia. The selected extracts are from McCrindle.[79] Though Strabo appears to follow Alexander's route in describing India's wonders, we have excluded the battles and confined our selections to the Indian country and people.

THE GEOGRAPHY OF STRABO

BOOK XV

Strabo confesses he has not visited India:

2. I must ask the reader to receive my description of this country with some indulgence, for it lies at a great distance off, and not many persons of our nation have seen it; such as have visited its shores have seen a part of it only, and their accounts consist chiefly of what they heard from report.

The self-immolation by Indian sages deeply impacted the Greek mind:

4. The merchants of the present day who sail from Egypt to India by the Nile and the Arabian Gulf have seldom made a voyage as far as the Ganges. They are ignorant men and unqualified for writing an account of the places they have visited. From one place in India and from one king, Pandion,[80]

but according to other writers, Porus,[81] there came to Caesar Augustus gifts and an embassy accompanied by the Indian Sophist who committed himself to the flames at Athens, like Kalanos, who had exhibited a similar spectacle in presence of Alexander.

10. From the former discussion it appeared that the views set forth by Eratosthenes in the third book of his *Geography,* in a summary concerning the country regarded as India at the time of its invasion by Alexander, are the most credible of all. At that period the Indus formed the boundary between India and Ariane, which lay immediately to the west,[82] and was subject to the Persians; for in later times the Indians occupied a great part of Ariane which they received from the Macedonians.[83]

Fertility and abundance; Greeks fascinated by Indian sugarcane:

20. Megasthenes indicates the fertility of India by the fact of the soil producing two crops every year both of fruits and grain. Eratosthenes writes to the same effect, for he speaks of a winter and a summer sowing and of rains at both seasons alike; for a year, he says, never passes in which rain does not fall at these periods, whence ensues a great abundance, the soil never failing to bear crops. An abundance of fruit is produced by trees; and the roots of plants, particularly of large reeds, are sweet, both in their nature and by coction; for the water, whether it comes from the clouds or the rivers, is warmed by the rays of the sun. He means, I think, to say, that what is called by other nations the ripening of fruits and juices is called by the Indians *coction*, and this tends to produce a flavour no less agreeable than the coction by fire. To the same cause he attributes the great flexibility of the branches of trees from which the wheels of carriages are made, as well as the fact that the country has trees upon which wool grows. Nearchus says that their webs of fine cotton were made from this wool,[84] and that the Macedonians used it for stuffing mattresses and the padding of saddles. The Seric fabrics are of a similar kind and made from some sorts of byssos bark, by combing the fibres.[85] About reeds he has noted that they yield honey,[86] although there are no bees; and he mentions a fruit-bearing tree, the produce of which causes intoxication.

The banyan tree held the Greeks in thrall:

21. India produces many remarkable trees: among others, one having branches which bend downwards, and leaves which are not less in size than a shield. Onesikritos (also Onesicritus) when describing minutely the country of Mousikanos,[87] which he says is situated in the most southern part of India, relates that there are some large trees from which branches grow out to the length even of twelve cubits. These branches then grow downwards as if they had been bent until they touch the ground. They next penetrate into the soil and take root like shoots that have been planted. Then they spring upwards and form a trunk, whence again, in the manner described, branches bend themselves downward and plant the ground with one layer after another, and so on in this order, so that from a single tree there is formed a long shady canopy like a tent supported by numerous pillars. As regards the size of the trees, he stated that their trunks could scarcely be clasped by five men. Aristoboulos also, where he mentions the Akesines and its confluence with the Hyarotis (river Ravi) speaks of trees with branches bent downward, and of such a size that fifty horsemen could be sheltered from the noontide heat under the shade of a single tree (*ficus Indica*, banyan-tree). According to Onesikritos, however, four hundred horsemen could be so sheltered.

Vine and medicinal plants:

22. In the country of Mousikanos there grows of itself, he says, a kind of grainlike wheat, and also a vine which produces wine, though other writers assert that there is no wine in India[88]… Both Aristoboulos and other writers related that India produces many medicinal plants which yield a great variety of dyes.[89] He adds that it was ordained by law that if any person discovered a deadly substance, he should be put to death unless he also discovered an antidote. If he discovered one, he was rewarded by the king. India, like Arabia and Ethiopia, produces cinnamon and spikenard and other aromatics. It has a temperature like theirs in respect of the sun’s rays, but it surpasses them in having copious supplies of water, whence the atmosphere is humid, and therefore more nutritious and productive, as is equally the case with the land and the water. On this account the land and the water

animals in India are found to be of a larger size than they are in other countries.

Taxila and the reference to snake worship in Abisaros:

28. Between the Indus and the Hydaspes is Taxila, a large city and governed by good laws.[90] The surrounding country is thickly peopled and extremely fertile, as the mountains here begin to subside into the plains. The inhabitants and their king, Taxiles, received Alexander with kindness, and in return came by more than they bestowed, so that the Macedonians were jealous, and said it appeared as if Alexander found none worthy of his bounty until he had crossed the Indus.[91] Some say that this country was larger than Egypt. Above this country among the mountains lie the dominions of Abisaros,[92] by whom, as the envoys who came from him related, were kept two serpents, one of which was 80 and the other 140 cubits in length. This we learn from Onesikritos, who may as well be called the master fabulist as the master pilot of Alexander. For all the companions of Alexander preferred the marvellous to the true, but this writer seems to have surpassed them all in telling tales of wonder. Some of his statements, however, are probably true and worthy of record, and must not be passed over even though one distrusts their veracity. Other writers also mention the serpents, and say that the natives hunt them among the Emodoi mountains[93] and rear them in caves.

Kathaians of Sangala, probably Amritsar region, were obsessed with beauty. Greek writers are awed by *Sati*:

30. … By way of embellishing their persons, they dye their beards with a great variety of the most florid hues. This custom prevails elsewhere among many of the Indians, who bestow great attention on dyeing both their hair and their garments with the colours of surprising beauty which their country produces. The people in other respects are frugal, but are fond of ornament. A peculiar custom is mentioned as existing among the Kathaians – that the husband and wife choose each other, and that the wives burn themselves along with their deceased husbands. The reason for this practice is that the wives would sometimes fall in love with young men, and desert their

husbands or poison them. This law was therefore instituted with a view to suppress the practice of administering poison. But it is probable that the law never existed nor the circumstances to which its origin is ascribed. It is said that in the country of Sopeithes there is a mountain not far off, as Gorgos the miner has testified. The Indians being unacquainted with mining and the smelting of ores do not know their own wealth, and therefore traffic with greater simplicity.

On a powerful breed of dogs in Punjab:

31. It is related that the dogs in the country of Sopeithes are of astonishing courage. Alexander received one hundred and fifty of them as a present from Sopeithes. To prove their mettle, two were set on to attack a lion, and when these were overpowered, two others set on. When the contest was about equal, Sopeithes ordered a man to seize one of the dogs by the leg and to drag him away, or if he still held on, to cut off the limb. Alexander at first refused to let the dog be so mangled, as he wished to save its life, but when Sopeithes said, 'I will give you four instead of it,' he consented, and saw the dog allow its leg to be cut off by slow incision rather than let go its hold.[94]

Simplicity of the people and the sheer wealth of the Mousikanos of Upper Sind:

34. Onesikritos… expatiates in praises of the country of Mousikanos, and notices those characteristics which its inhabitants share with other Indians, that they are long-lived and that the term of life extends to 130 years (the Seres, however, according to some writers, are still longer-lived), that they live sparingly and are healthy, even though their country produces everything in abundance. The following customs, however, are peculiar to them: to have a common meal which they eat in public as did the Lacedemonians, their food consisting of the produce of the chase; to use neither gold nor silver though they have mines of these metals; to employ instead of slaves young men in the flower of their age, as the Cretans employ the Aphamiotai, and the Lacedemonians the Helots; to study no science with attention except that of medicine, for they regard the excessive pursuit of any art, as war for instance and the like, as wickedness; to have

no actions at law but for murder and outrage, for to escape these evils does not lie in one's own power, but it is otherwise in the case of contracts where each one can protect his own interests, so that if one of the parties violates his faith, the other must endure the wrong, for a man must be cautious whom he trusts, and not engross the attention of the city with his lawsuits. Such are the accounts given by men who accompanied Alexander in his expedition.

Pataliputra and the Hindu caste system:

36. Palibothra [is] a city 80 stadia in length and 15 in breadth. It is of the shape of a parallelogram, and is surrounded by a wooden wall, pierced with loopholes for the discharge of arrows. It has a ditch in front for the purpose of defence and for receiving the sewage of the city. The people in whose country this place is situated are the most distinguished in all India, and are called the Prasioi.[95] The king in addition to his family name must adopt the surname of Palibothros, as Sandrokottos, for instance, did, to whom Megasthenes was sent on an embassy. This custom also prevails among the Parthians, for all are called Arsakai.[96]

39. He (Megasthenes) says that the population of India is divided into seven castes.[97] The first in rank but smallest in number are the philosophers. Persons who wish to offer sacrifices or perform other sacred rites employ their services on their private account, but the kings employ them on the public account, at what is called the Great Assembly, where at the beginning of the New Year all the philosophers repair to the king at the gates. Here any of them who may have committed anything useful to writing, or observed any means for improving the crops and the cattle, or anything of advantage to the state, declares it publicly. If any one is detected giving false information, thrice the law enjoins him to be silent for the rest of his life, but he who proves to have been correct in his observations is exempted from paying any taxes or contributions.

40. The second caste consists of the husbandmen, who form the bulk of the population and are of a very mild and gentle disposition. They are exempted from military service, and cultivate their lands undisturbed by fear. They do not go to cities, either on business or to take part in their

tumults. It therefore frequently happens that at the same time, and in the same part of the country, men may be seen marshalled for battle and risking their lives against the enemy, while other men are ploughing or digging in perfect security under the protection of these soldiers. The whole of the land belongs to the crown, and the husbandmen till it on condition of receiving as wage one-fourth of the produce.

41. The third caste consists of shepherds and hunters, who alone are permitted to hunt and to keep cattle and to sell beasts of burden or to let them out on hire. In return for clearing the land of wild beasts and birds which infest sown fields, they receive an allowance of corn from the king. They lead a wandering life and dwell in tents. No private person is permitted to keep a horse or an elephant. The possession of either is regarded as a royal privilege. These animals are under the charge of grooms.[98]

Strabo diverts discussion on caste to discuss snakes:

45. Nearchos expresses his surprise at the multitude and malignancy of the tribe of reptiles. They retreat from the plains to the villages which do not disappear under water at the time of the inundations, and fill the houses. On this account the people raise their beds to a great height from the ground, and are sometimes compelled to abandon their homes, through the presence of these pests in overwhelming numbers. In fact, were it not that a great proportion of the tribe suffered destruction by the waters, the country would be reduced to a desert. The minute size of some and the immense size of others are sources of danger; the former, because it is difficult to guard against their attacks, the latter by reason of their strength, for snakes are to be seen of sixteen cubits in length. Charmers go about the country who are supposed to be able to cure snake-bites, and their art of medicine is all but entirely restricted to this, for they are seldom attacked by diseases, as they live frugally and abstain from wine. When diseases do attack them their wise men treat them for recovery. Aristoboulos says that he did not see a single example of the magnitudes so much talked of – except a snake which was nine cubits and a span in length – I myself saw one in Egypt much about that size which had been brought from India.[99] He says also that he saw many serpents of a much smaller size, and asps and large scorpions.

None of these however are so dangerous as the slender small snakes, not more than a span long, which are found concealed in tents, in house utensils, and in walls and hedges. Persons wounded by them bleed at every pore, and suffer great pain, and die if assistance is not immediately rendered; but assistance is at command on account of the efficacy of Indian roots and drugs. Not many crocodiles, he says, are to be found in the Indus, and these are harmless to mankind,[100] but most of the other animals of that river are the same as those bred in the Nile, except the thrissa, the mullet, and the dolphin, on account of the crocodiles, but great numbers ascend the Indus. Small prawns find their way up as far as the mountains, and the larger sort as far as the junction of the Indus and Akesines. So much then on the subject of wild animals. Let us now return to Megasthenes, and resume from where we digressed.

Caste system of Megasthenes (continued) :

46. After hunters and shepherds, the fourth caste follows, consisting, he says, of those who work at trades, vend wares, and are employed in bodily labour. Some of these pay taxes, and render to the state certain prescribed services. But the armour-makers and shipbuilders receive wages and provisions from the kings for whom alone they work. The commander-in-chief supplies the army with weapons, and the admiral of the fleet lets out ships on hire both to those who undertake voyages and to merchants.

47. The fifth caste consists of fighting-men, who, when not engaged in active service pass their time in idleness and drinking. They are maintained at the king’s expense, and hence are always ready, when occasion calls, to take the field, for they carry nothing of their own with them but their own bodies.

48. The sixth caste consists of the inspectors. To them is entrusted the superintendence of all that goes on, and of making reports privately to the king. The city inspectors employ as their coadjutors the courtesans of the city, and the inspectors of the camp the courtesans who follow the army.

49. The seventh caste consists of the counsellors and assessors of the king. To them belong the offices of state, the tribunals of justice and the general administration of public affairs. No one is allowed to marry out of his own caste, or to exchange one profession or trade for another, or to follow more

than one business. An exception is made in favour of a member of the philosopher caste on account of his superior merit.

On magistrates, taxes and city administration:

50. Of the magistrates some have the charge of the market, others of the city, others of the soldiery. Some superintend the rivers, measure the land, as in Egypt, and inspect the sluices by which water is let out from the main canals into their branches, so that every one may have an equal supply of it. These persons have charge also of the hunters, and have the power of rewarding or punishing them according to their deserts. They collect the taxes and superintend the occupations connected with land, as those of the woodcutters, the carpenters, the blacksmiths, and the miners. They make the public roads, and at every ten stadia set up a pillar to indicate the byroads and distances.

51. Those who have charge of the city are divided into six bodies of five each. The first have the inspection of everything relating to the industrial arts, the second entertain strangers, assign them lodgings, observe their mode of life by means of the attendants whom they attach to them, and escort them out of the country, or, if they die, send home their property, take care of them in sickness, and when they die, bury them. The third body consists of those who enquire at what time and in what manner births and deaths occur, not only for the purpose of imposing a tax, but also of preventing births or deaths, whether among the high or the low from being concealed. The fourth body is occupied with retail and barter. Its members have charge of weights and measures, and see that products in season are sold by public notice. No one is allowed to deal in a variety of articles unless he pays a double tax. The fifth body supervises manufactured articles and sells them by public notice. What is new is sold separately from what is old, and there is a fine imposed for mixing them together. The sixth and last body consists of those who collect the tenth of the price of the articles sold. Fraud in the payment of this tax is punished with death. Such are the functions which these bodies separately discharge. In their collective capacity they have charge both of their special departments and of matters affecting the public welfare, such as the repairs of public works, the regulation of prices, and the care of markets, harbours, and temples.

52. Next to the city-magistrates there is a third governing body which directs military affairs. This also consists of six divisions with five members to each. One division is associated with the admiral of the fleet, another with the superintendent of the bullock-teams used for transporting military engines, food for the soldiers, provender for the cattle, and other military requisites. They supply attendants who beat a drum, and others who carry gongs; grooms also for the horses, and mechanists and their assistants. By the sound of the gong they send out foragers to bring in grass, and by rewards and punishments ensure the work being done with dispatch and safety. The third division has charge of the infantry, the fourth of the horses, the fifth of the war-chariots, and the sixth of the elephants. There are royal stables for the horses and elephants, and also a royal magazine for the arms, because the soldier has to return his arms to the magazine, and his horse and his elephant to the stables. They use the elephant without bridles. The chariots are drawn on the march by oxen, but the horses are led along by a halter, that their legs may not be galled and inflamed, nor their spirits damped by drawing chariots. In addition to the charioteer two men-at-arms sit beside him in the chariot. The war-elephant carries four men – three who shoot arrows from his back – and the driver.

Moral character of Indians :

53. The Indians all live frugally, especially when in camp. They care not to congregate in large unruly masses, and they consequently observe good order. Theft is a thing of very rare occurrence. Megasthenes, who was in the camp of Sandrokottos which consisted of 400,000 men, says he found that the thefts reported on any one day did not exceed the value of 200 drachmai,[101] and this among a people who have no written laws, but are ignorant of writing, and conduct all matters by memory.[102] They lead nevertheless happy lives, being simple in their manners and frugal. They never drink wine except at sacrifices. Their beverage is prepared from rice instead of barley, and their food is principally a rice-pottage. The simplicity of their laws and their contacts appears from the fact that they seldom go to law. They have no suits about pledges or deposits, nor do they require either seals or witnesses, but make their deposits and confide in one another. Their houses and property are for the most part unguarded.

54. Their favourite mode of exercising the body is by friction in various ways, but especially by passing smooth ebony rollers over the surface of the body. Their tombs are plain, and the mounds raised over the dead, lowly. In contrast to the simplicity they observe in other matters, they love finery and ornament. They wear dresses worked in gold, and adorned with precious stones, and also flowered robes made of fine muslin. Attendants follow them with umbrellas; for they hold beauty in high esteem and resort to any device which helps to improve their looks. They respect alike truth and virtue. Hence they assign no special privileges to the old unless they possess superior wisdom.

The Indian rulers:

55. The care of the king's person is entrusted to women, who also are bought from their parents. The bodyguards and the rest of the soldiery are posted outside the gates. A woman who kills a king when drunk is rewarded by becoming the wife of his successor. The sons succeed the father. The king may not sleep during the daytime, and at night he is obliged to change his couch from time to time to defeat plots against his life. The king leaves his palace not only in time of war, but when he has to sit in court to try causes. He remains there for the whole day without allowing the business to be interrupted, even though the time arrives for attending to his person. This attention consists in the friction of his person with cylinders of wood. He continues hearing cases while the friction, which is performed by four attendants, is still proceeding.[103]

Types of Philosophers, personal discipline, sexual abstinence, vegetarian and other ethics, notions of death:

58. Speaking of the philosophers, he says that those who inhabit the mountains are worshippers of Dionysos, showing as proofs *that he had come among them* the wild vine which grows in their country only, and the ivy, and the laurel, and the myrtle, and the box-tree, and other evergreens, none of which are found beyond the Euphrates except a few in parks, which it requires great care to preserve. Some of their customs are of a Dionysiac character, their wearing muslin robes and the turban, using perfumes, dressing themselves in garments dyed of florid hues, and their kings

marching out from the palace to the beat of the drum and the jingling of musical bells. But the philosophers who live in the plains worship Herakles.[104]

59. According to another principle of division, he makes two sects of the philosophers, one of which he calls the Brachmanes and the other the Garmanes.[105] The Brachmanes are held in higher estimation, for they agree more exactly in their opinions. From the time of their conception in the womb they are under the care and guardianship of learned men who go to the mother, and under the pretence of using some incantations for the welfare of herself and her unborn child, in reality give her prudent hints and counsels, and the women who listen to them most willingly are thought to be the most fortunate in their offspring. After their birth the children are under the care of one person after another, and as they advance in years their masters are men of superior accomplishments. The philosophers reside in a grove in front of the city within a moderate-sized enclosure. They live in a simple style and lie on pallets of straw and (deer) skins. They abstain from animal food and sexual pleasures; and occupy their time in listening to serious discourse and in imparting knowledge to willing ears. But the hearer is not permitted to speak or cough, or even to spit, otherwise he is cast out from their society that very day as being a man without self-control. After living in this manner for seven-and-thirty years,[106] each individual retires to his own possessions, where he lives in security and under less restraint, wearing robes of muslin and a few gold ornaments on his fingers and in his ears. They eat flesh, but not that of animals which assist man in his labours, and abstain from hot and highly seasoned food…. The Brachmanes do not communicate a knowledge of philosophy to their wives, lest they should divulge any of the forbidden mysteries to the profane, if they became depraved, or lest they should desert them if they became good philosophers; for no one who despises alike pleasure and pain, life and death, is willing to be subject to another; and this is the character both of a good man and of a good woman.

Their discourse turns most frequently on death. They regard this life as the time, so to speak, when the child within the womb becomes mature, and death as a birth into a real and happy life for those that are philosophers. On this account they undergo much discipline as a preparation for death. They

consider nothing that befalls men to be either good or bad, for otherwise some persons would not be affected with sorrow and others with joy by the very same things, their notions being as inane as dreams, nor would the same persons be affected at different times with sorrow and joy by the very same things. With regard to ideas about physical phenomena, our author says that they display great simplicity, for they are better in their actions than in their reasoning, their belief being chiefly based upon fables. On many points, however, their opinions coincide with those of the Greeks, for the Brachmanes say with them that the world was created, and is liable to destruction, that it is of a spherical figure, and that the Deity who made and governs it is diffused through all its parts. They hold that the principles of all things are different, but that water was the principle employed in the formation of the world; that in addition to the four elements there is a fifth nature from which the heaven and the stars were produced, and that the earth is situated in the centre of the universe. Concerning generation, the nature of the soul, and many other subjects, they express views similar to those of the Greeks. They wrap up their doctrines about the immortality of the soul and judgment in Hades in fable after the manner of Plato. This is the account which Megasthenes gives of the Brachmanes.

60. Of the Sarmanes the most honourable, he says, are those called the Hylobioi.[107] They live in the forests, subsist on leaves and wild fruits, wear garments made from the bark of trees, and abstain from wine and commerce with women. They communicate with the kings who consult them by messengers regarding the causes of things, and who through them worship and supplicate the Deity. Next in honour to the Hylobioi are the physicians for they apply philosophy to the study of the nature of man. They are frugal in their habits, but do not live in the fields. Their food consists of rice and barley-meal, which every one gives who is asked, as well as every one who receives them as a guest. By their knowledge of medicine they can make persons have a numerous offspring and make also the children to be either male or female. They effect cures rather by regulating diet than by the use of medicines. The remedies in most repute are ointments and plasters. All others they suppose to partake largely of a noxious nature. Both this class and the other class of persons practice fortitude as well by undergoing active toil as by enduring suffering, so that they will remain motionless for

a whole day in one fixed posture. Besides these there are diviners and sorcerers and those who are conversant with the rites and customs relating to the dead, who go about villages and towns begging. Those who are more cultured than these, and mix more with mankind, inculcate the vulgar opinions concerning Hades, which they think conducive to piety and sanctity. Women study philosophy with some of them, but they too abstain from sexual intercourse.

On Alexander's meeting with Brahmin Sages, one of whom returned with him:

61. Aristoboulos says that in Taxila he saw two of the sages, both Brachmanes; the elder had his head shaved, but the other wore his hair; both of them were followed by their disciples. Their spare time is spent in the market-place; in respect of their being public counsellors they receive great homage, and have the privilege of taking without payment whatever they want that is offered for sale; on every person whom they accost they pour oil of sesamum until it trickles down to their face; of honey, which is exposed for sale in great quantity, and of sesamum they take enough wherewith to make cakes, and their food costs them nothing. They came to Alexander's table and took their meal standing, and gave an example of their endurance by retiring to a place that was near where the elder lying on his back endured the sun and the rains which were now falling, as spring had by this time set in. The other stood on one leg holding up with both his hands a beam of wood about three cubits long; when the leg became fatigued he supported himself on the other, and continued thus the whole day long. The younger seemed to have far greater self-control, for having followed the king for a short distance he quickly turned back home. The king sent after him, but he requested the king to come to him if he wanted anything at his hands. The other accompanied the king to the end of his days, and in staying with him dressed in a different style and altered his whole mode of life. When he was reproached by some for so doing, he answered that he had completed the forty years of asceticism which he had promised to observe.[108]

Discourse about philosophy with Naked Sages and their choice of fire for the cessation of life:

63. Onesikritos says that he himself was sent to converse with these sages. For Alexander heard that these men went about naked, inured themselves to hardships, and were held in highest honour; that when invited, they did not go to other persons, but requested such to come to them if they wished to participate in their exercises or conversations. Such being their principles, Alexander neither thought it consistent with his dignity to go to them nor cared to compel them to do anything that was contrary to their inclinations and their native customs. He therefore dispatched Onesikritos to them, who relates that he found at the distance of twenty stadia from the city fifteen men standing in different postures, sitting or lying down naked, who did not move from these positions till the evening, when they returned to the city. The most difficult thing to endure was the heat of the sun, which was so violent that no one else could without pain endure to walk on the ground at midday with bare feet.

64. He conversed with Kalanos, one of these sages, who afterwards accompanied the king to Persis, where he died after the manner of his country, amid the flames of the funeral pyre on which he had been laid. Onesikritos found him at the time of his visit lying upon stones. He approached the sage, and, having accosted him, informed him how he had been sent by the king to hear their wisdom, and to bring him a report of its nature. So then, if there was no objection, he was ready to listen to his discourse. Kalanos, observing that he wore a mantle, a broad-brimmed cap and long boots, laughed, and said: In former times the world was full of corn and barley, as it is now of dust; the fountains then flowed, some with water and others with milk, or it might be with honey or with wine and with oil; but mankind by repletion and luxury became proud and insolent. Then Zeus, indignant at this state of things, made all disappear, and allotted to man a life of toil. When temperance, however, and other virtues had appeared once more in the world, an abundance of good things again arose. But at present the condition of satiety and wantonness was approaching, and threatened to do away with the existing state of things. Having spoken thus, he requested Onesikritos, if he wished to hear him, to strip off his

clothes, and lying down naked on the same stones with himself, to listen to his discourse.

While Onesikritos was hesitating what to do, Mandanis, who was the oldest and wisest of these sages, rebuked Kalanos for his insolence and for his showing that vice himself even while condemning it in others. He then called Onesikritos to him, and said that he praised the king because though he ruled over so great an empire, he nevertheless desired wisdom, and was the only philosopher in arms that he had ever seen. It would indeed be the greatest of all benefits if those who have the power to persuade the willing and compel the unwilling to learn moderation were men of good sense. 'I am entitled,' he added, 'to indulgence, if, while conversing by means of three interpreters, who, except the language, understand nothing we say any more than the vulgar, I am unable to demonstrate the utility of *philosophy.* One might as well expect water to flow pure through mud.'

65. The tendency of his discourse, he said, was this, that the best doctrine was that which removed pleasure and grief from the mind; that grief differed from labour in that the former was an enemy and the latter a friend to man; for men exercised their bodies with labour in order to strengthen their mental powers, by which means they would put an end to dissensions, and would unite in giving good counsel to all, both to the public and to individuals. They would now unite also in advising Taxiles to receive Alexander as a friend, for if he received a person better than himself, he would dispose him to good. Mandanis having spoken to this effect, then enquired whether such doctrines were current among the Greeks. Onesikritos replied 'that Pythagoras taught a similar doctrine, and enjoined his disciples to abstain from animal food; and that Sokrates and Diogenes,[109] to whose discourses he had listened, held like opinions. Mandanis replied that in other respects he thought they entertained sound notions, but erred on one point by preferring custom to nature, for otherwise they would not be ashamed to go naked like himself and to subsist on frugal fare – for that was the best house which required least repairs.' He says also that they busy themselves with enquiries concerning natural phenomena, prognostics, rains, droughts and diseases. When they repair to the city they disperse themselves in the market-place. If they happen to meet any who carried figs or bunches of grapes, they take what he bestows without giving

anything in return. If he carries oil, he pours it over them, and they are anointed with it. Every wealthy house is open to them, even the apartments of the women. On entering they share the repast and join in the conversation. It is considered most disgraceful to have any bodily disease. Hence when one suspects himself to be infected he rids himself of life by means of fire, for having prepared a funeral pile and anointed himself, he settles himself upon the pyre, orders it to be kindled, and remains motionless while he is burning.

66. Nearchos gives the following account of the Sages. Some of the Brachmanes take part in political life, and attend the kings as counsellors. The others are engaged in the study of nature. Kalanos belonged to the latter class. Women study philosophy along with them, and all lead an austere life. With respect to the customs of the other Indians, he informs us that their laws, whether those applicable to the community or to individuals, are not committed to writing, and are quite different from those of other nations. For example, among some tribes it is the custom to offer virgins as a prize to the victor in a boxing-match, so that they may be married though portionless.[110] Among other tribes again the land is cultivated by families in common, and when the crops are collected, each person takes a load for his support throughout the year. The remainder of the produce is burned to give them a reason for setting to work anew, and not remaining idle. Their weapons consist of a bow and arrows which are three cubits long, or a javelin and a shield, and a broadsword three cubits long. Instead of bridles they use muzzles which differ little from halters, and the lips are perforated with spikes.

68. As an example of the disagreements among writers on India, we may take what they say about Kalanos. They are at one in stating that he went away from India with Alexander, and while still with him underwent a voluntary death by fire, but they do not agree as to the cause and manner of his death; for some have written to this effect: Kalanos accompanied the king in the capacity of his eulogist beyond the mountains of India, contrary to the common custom of the philosophers of that country, who attend upon their kings, instructing them in matters relating to the gods, in the same manner as the Magi attend the Persian kings. When he became sick at Pasargadai,[111] this being the first sickness he ever had, he put an end to

himself in his seventy-third year, without heeding the entreaties of the king. A pyre was raised and a golden couch placed upon it. He then laid himself down thereon, and having covered himself up was burned to death. Others again say that a chamber was constructed of wood and filled with the leaves of trees, and that a pyre having been made upon the roof, he was shut up in it according to his directions, after the procession with which he had been accompanied – that he then flung himself upon the pyre, and was consumed like a beam of wood along with the chamber. Megasthenes, however, says that self-destruction is not a dogma of the philosophers, but that those who commit this act are regarded as foolhardy; that some are naturally of a severe temper and inflict wounds upon their bodies or cast themselves down a precipice, that those who are impatient of pain drown themselves, and those of ardent tempers throw themselves into the fire. Kalanos was a man of this stamp. He was ruled by his passions and became a slave to the table of Alexander. He is on this account condemned by the Indians, but Mandanis is praised, because when messengers from Alexander invited him to go to the son of Zeus, with the promise of gifts if he complied, and threats of punishment if he refused, he did not go. Alexander, he said, was not the son of Zeus, for he was not so much as the master of the larger part of the world. For his part he wanted none of the gifts of a man whose desires nothing could satiate, and as little did he fear his threats, for while he lived India would supply him with food enough, and when he died he would be delivered from the flesh now wasted with age, and would be translated to a better and a purer state of existence. Alexander commended him and excused him from coming.

70. The Pramnai[112] are philosophers opposed to the Brachmanes, and are contentious and fond of argument. They ridicule the Brachmanes who study physiology and astronomy as fools and impostors. Some of them are called the Pramnai of the mountains, others the Gymnetai, and others again the Pramnai of the city or the Pramnai of the country. Those of the mountains wear deer-skins and carry wallets filled with roots and drugs, professing to cure diseases by means of incantations, charms, and amulets. The Gymnetai, in accordance with their name, are naked, and live generally in the open air practicing endurance, as I have already mentioned, for seven-and-thirty years. Women live in their society without sexual commerce.

71. The Pramnai of the city live in towns and wear muslin robes, while those of the country clothe themselves with the skins of fawns or antelopes. In a word, the Indians wear white apparel – white muslin and linen (contrary to the statements of those who say that they wear garments dyed of florid hues); all of them wear long hair and long beards, plait their hair and bind it with a fillet.

.

CHAPTER — 4

PLINY

Gaius Plinius Secundus (c. AD 23-79), the Elder Pliny, was a Roman scholar, statesman, and author of *Naturalis historia* (*Natural History*), comprising 37 books dealing with geography, ethnography, anthropology, physiology, zoology, and other subjects. Pliny went to Rome after the death of Nero and held several high offices of state, patronised by Vespasian and his son Titus. He published the first ten books himself about AD 77, dedicated to Titus. The rest were published by his nephew and adopted son, Pliny the Younger, after his death in the eruption of Mount Vesuvius two years later. Pliny's *Natural History* has several valuable references to India (Book VI) as they record facts not mentioned elsewhere. The extracts selected are based on English translations of McCrindle[113] (M-V) and Bostock (*The Natural History of Pliny* translated by John Bostock and H.T. Riley, London, George Bell and Sons 1890). We have tried to avoid topics dealt with by other authors, though some overlapping is inevitable in a work of this nature, and nuances by various authors themselves make interesting reading. We have excluded narratives on "fabulous races" as utterly irrelevant to the modern reader.

Position, boundaries, and physical characteristics of India:

Book VI. c. 17 (21) But where the chain of Hemodus rises the communities are settled, and the nations of India, which begin there, adjoin not only the eastern sea but also the southern, which we have already mentioned under the name of the Indian Ocean. That part which faces the east runs in a straight line to the bend where the Indian Ocean begins, and measures 1875 miles. Then from this bend to the south up to the river Indus, which forms the western boundary of India, the distance, as given by Eratosthenes, is 2475 miles. But many authors have represented the total length of its coast as being a sail of forty days and forty nights, and its length from north to south as being 2850 miles.[114] Agrippa has estimated its length at 3300 miles, and its breadth at 2300…

Here the appearance of the heavens is entirely changed, and the stars rise differently; there are two summers in the year, and two harvests having winter between them, while the Etesian winds are prevalent; and during our winter the breezes there are light and the seas navigable. In this country the nations and cities are numberless should one attempt to reckon them all up. It was opened up to our knowledge not only by the arms of Alexander the Great and of the kings who succeeded him, Seleucus and Antiochus, as well as by their admiral Patrokles who sailed round even into the Hyrcanian and Caspian seas, but also by certain Greek authors, who resided with Indian kings, such as Megasthenes, and Dionysius who was sent by Philadelphus, and have thus informed us of the power and resources of the Indian nations.

However, there is no room for a careful examination of their statements, they are so diverse and incredible. The companions of Alexander the Great have written that in that tract of India, which he subdued, there were 5000 towns, none less than Cos – that its nations were nine in number – that India was the third part of all the world, and that the multitude of its inhabitants was past reckoning. For this there was probably a good reason, since the Indians almost alone among the nations have never emigrated from their own borders. Their kings from Father Bacchus down to Alexander the Great are reckoned at 153 over a space of 6451 years and three months. The vast size of their rivers fills the mind with wonder. It is recorded that Alexander on no day had sailed on the Indus less than 600 stadia, and was unable to reach its mouths in less than five months and a few days and yet it appears that it is smaller than the Ganges. Seneca, who was our fellow-citizen and composed a treatise on India, has given the number of its rivers at 60, and that of its nations at 118. It would be as great a difficulty should we attempt to enumerate its mountains. The chains of Imavos, Hemodus, Paropanisus, and Caucasus are mutually connected, and from their base the whole country sinks down into a plain of immense extent and bears a great resemblance to Egypt. But that our account of the geography of these regions may be better understood, we shall tread in the steps of Alexander the Great, whose marches were measured by Diognetes and Baeton.

On the land and the people:

Book VII. c. 2. India and the regions of the Ethiopians are particularly abundant in wonders. In India the largest of animals are produced; their dogs, for instance, are much bigger than any others, and as for their trees, they are said to be of such vast height that it is impossible to shoot arrows over them. Such besides is the fertility of the soil, the geniality of the climate, and the abundance of water, that if we may believe what is said, troops of cavalry can find shelter under a single fig-tree. The reeds are here also of so prodigious a length that a section between two nodes can make a canoe, capable, in some instances, of holding three men….

Their philosophers, whom they call Gymnosophists, are accustomed to remain in one posture with their eyes immovably fixed on the sun from his rising till his going down, and to stand on the burning sands all day long now on one foot and then on the other…[115]

INDIAN ANIMALS

Alexander's fleet first sees whales at sea:

Book IX. C.2. The most numerous and the largest of these (aquatic) animals are to be found in the Indian Sea. Among them are *baloenoe* of 4 *jugera,* and the *pristis,* 200 cubits in length.[116] Here, too, are lobsters of 4 cubits and in the river Ganges eels 300 feet long.[117] But at sea it is about the time of the solstices when these monsters are most to be seen. For it is then that in these regions the whirlwinds sweep on amain, the rains descend, the hurricanes rush onward, hurled down from the mountain tops, while the sea upheaved from the very bottom rolls upon its surges the monsters that have been driven from their retreats in the depths below. At other times such vast shoals of tunnies are encountered that the fleet of Alexander the Great formed itself into line of battle to confront them, as it would have done when opposed to a hostile fleet, for except by charging them with long pikes, the danger could not otherwise be evaded. No shouts, no noises, no crashing blows availed to frighten them. Nothing but their utter discomfiture dismayed and confounded them…[118]

The sea turtle and other fish:

C. 12. The Indian Sea produces turtles of such vast size that the shell of a single animal suffices to roof over a habitable cottage.

C. 17. In the Ganges, a river of India, is found a fish called the *platanista;* it has the muzzle and the tail of the dolphin, and is of the length of 16 cubits.[119]

C. 35. Those fish called sea-mice, as well as the polypi and the muraenae, are in the habit of coming ashore. In the Indian rivers there is besides a certain kind of fish which does this and then leaps back, for they pass over into standing waters and streams. Most fishes are evidently led by instinct to do this that they may spawn in safety, since in such waters there are no animals to devour their young, and the waves are less violent. It is still more a wonder to find that they have a comprehension of causation and observe the recurrence of periods, when we reflect that the best time for catching fish is while the sun is passing though the sign of *Pisces*.

Varieties of birds:

Book X. 2 (2). Ethiopia and India, more especially, produce birds of diversified plumage, and such as quite surpass all description.

C. 30 (23). By the departure of the cranes which were in the habit of waging war with the pygmies, that race now enjoys a respite from their hostilities. The tracts over which they travel must be immense, when we consider that they come from such a distance as the Eastern Sea.

C. 41 (58). Above all, there are birds that imitate the human voice – parrots, for instance, which are even able to converse. This bird is sent us from India, where it is called the septagen. The body is all over green, except that around its neck it is marked with a ring of red. It salutes its masters, and pronounces such words as it hears spoken. It becomes very frolicsome under the effects of wine. Its head is as hard as its beak, and this is beaten with an iron rod if it does not learn to speak what it is being taught, for it feels no pain if struck elsewhere than on the head.

The Indian ass:

Book XI. C. 46 (106). Horned animals are in general cloven-footed, but no animal has at once a solid hoof and a pair of horns. The Indian ass alone

is armed with a single horn… and is the only instance of a solid-hoofed animal that is provided with a pastern-bone.

C. 10 (45). The Greeks had no knowledge from experience of the urns and bison, although the forests of India are filled with herds of wild oxen.

INDIAN PLANTS

Wool bearing trees and the ebony tree:

Book XII. 4 (8). In our account of the Seres we have mentioned their trees which bear wool, and have likewise noticed the immense size of the trees of India. One tree peculiar to that country – the ebony tree – has been extolled by Virgil, who teaches us that it grows nowhere else.[120] Herodotus, however, leads us to believe that it was rather a product of Ethiopia, for he informs us that the people of that country paid every third year to the kings of Persia by way of tribute one hundred planks of ebony wood, together with a certain amount of gold and ivory.

C. (9). There are two kinds of ebony; the better sort is scarce, and is remarkably free from knots. It is black and lustrous, and pleases the eye at once without the aid of art. The other sort is produced from a shrub like cytisus and is found in all parts of India.

Fig tree:

C. (11). The fig-tree of that country produces but a small fruit. Always propagating itself spontaneously it spreads out far and wide with its vast branches, the ends of which bend downward to the ground to such a degree that in the course of a year they take root again and young daughters grow around the mother-tree circlewise as in ornamental gardening. Within that enclosure, which is overshadowed and protected by the rampart of stems thrown out by the tree, shepherds are wont to spend the summer; the circuit of overarching boughs presenting a scene of great magnificence whether viewed from a distance or from under the leafy canopy. The higher branches of the tree shoot far up into the sky in multitudinous ramifications from the vast trunk of the parent tree, so that it very often overspreads a circuit of sixty paces, while its shade covers as much as a couple of stadia. The broad leaves have the shape of an Amazonian buckler, and hence the

fruit being so much covered by the leaves is stunted in its growth, small in quantity, and never bigger than a bean. The figs, however, being ripened by the rays of the sun piercing through the leaves, are exceedingly luscious and worthy of the marvellous character of the tree which produces them. These trees are found more particularly in the neighbourhood of the river Acesines (Chenab).

C. 6 (12). There is a tree still larger which yields a still more luscious fruit – that on which the Indian sages subsist. The leaf, which is three cubits long and two cubits broad, resembles the wings of birds. The fruit, which grows on the bark, is remarkable for the wondrous sweetness of its juice, and is so large that one would of itself suffice for four persons. The tree is called the *pala* and its fruit *ariena*.[121] It is found in greatest abundance in the country of the Sydraci, which formed the limit reached by Alexander's expedition. There is besides another tree which resembles this one, though the fruit which it bears is sweeter, and, when eaten, produces severe disorders of the bowels. Alexander published an order forbidding any one in his army touching this fruit.[122]

C. (13) The Macedonians have mentioned various kinds of trees (in India) but generally without giving their names. There is one which resembles the terebinth (turpentine tree) in every respect except the fruit, which is like the almond though it is of a smaller size, and remarkable for its extreme sweetness. It was found chiefly in Bactra, and some persons took it to be a variety of terebinth rather than a tree to which it bore a striking resemblance. As to the tree again from which they make a kind of linen cloth, in leaf it resembles the mulberry tree, while the calyx of the fruit is similar to the dog-rose. It is reared in cultivated grounds, and no other kind of plantation makes such a charming landscape around a country-seat.

The Indian pepper:

C. 7 (14). The olive-tree in India is sterile, with the exception however of the wild olive. The pepper plant grows everywhere (in India), and resembles our junipers in appearance, though some writers assert that they only grow on the slopes of Caucasus, which lie exposed to the sun.[123] The seeds differ from the juniper by their being enclosed in very small pods

such as we see in kidney beans. These pods make what is called long pepper, if, before they burst open, they are plucked and then dried in the sun. But when they are allowed to ripen, they gradually split open, and at maturity disclose the white pepper, which then by exposure to the heat of the sun changes its colour and becomes wrinkled. These products, however, are liable to a peculiar disease, for if the weather be bad they are attacked with a smutty kind of blight, which makes the seeds nothing but rotten empty husks, called *bregma,* a term which in the Indian language signifies *dead*. Of all the kinds of pepper this is the most pungent and the lightest, while the white kind is less pungent than either. The root of this tree is not, as some have supposed, the article called by some writers, *Zimpiberi* while others call it *Zingiberi* (ginger), although its taste is very similar… Long pepper is very easily adulterated with Alexandrian mustard. It sells at fifteen denarii the pound, the white kind at seven, and the black at four. It is surprising how it has become such a favourite article of consumption; for while other substances attract us, some by reason of their sweetness, and others because they are of an inviting appearance, pepper has nothing to recommend it either for fruit or berry, its pungency being the only quality for which it is esteemed; and yet for this it must be fetched from far away India…. Both pepper and ginger grow wild in their respective countries, and yet here we buy them by weight like gold and silver. Italy too now produces a kind of pepper-tree… but its 'pepper' has not that mature flavour which the Indian sort acquires by its exposure to the sun.

C. (15) There is, moreover, in India, a grain similar to pepper, but larger and more brittle, and this is called *caryophyllon*.[124] The same country produces also on a thorny shrub a grain resembling pepper which is remarkable for its pungency. The leaves of this shrub are small and packed closely together like those of the privet. Its branches, which are three cubits long, are of a pallid colour, while its root is wide-spreading and woody, and of the colour of boxwood. From this root, when boiled along with the seed in a copper vessel, is prepared the medicament called *lycion*.[125] The Indians send us this preparation in vessels made from the skins of camels or rhinoceroses. Some persons in Greece call the shrub itself the *Chironian pyxacanthus*, the berberry shrub, or box-thorn.

Medicinal herb:

C. 8 (16) *Macir* also is brought to us from India. It is the red bark of a large root called by the same name as the tree which grows from it. What the tree is like I have not been able to learn. A decoction of this bark with honey is used in medicine as a specific for dysentery.

Sugarcane fascinated all Greek writers:

C. (17) Arabia too produces sugar, but the Indian kind is more esteemed, it is a honey collected in reeds, white like gum, and brittle to the teeth.[126] The largest pieces are of the size of a filbert nut; it is only used in medicine.

Aromatic herbs and unguents:

C. 12 (25). There is a root and also a leaf which are both very highly prized by the Indians. The root is that of the *costus*; it is burning hot to the taste, and has an exquisite aromatic odour; the shrub is otherwise of no use.[127] In the island of Patale, at the very mouth of the Indus, two kinds of it are found – one black, the other white, and this is the better of the two. The price of this article is five denarii per pound.

C. 26 Of the leaf, which is that of the *nardus*, it is but proper we should write at greater length, seeing that it holds the first place among unguents. This shrub[128] has a root thick and heavy, but short, black and brittle notwithstanding that it is unctuous, and has a musty smell like that of the *cypirus*. It has a sharp, acrid taste, and its leaves are small and thickly set together. At the top the nard spreads out into ears, and hence it is celebrated as being doubly dowered – with spikes and ears and with leaves that are both of high value.

(Nard's) purity is tested by its lightness, the redness of its colour, the sweetness of its smell, and more particularly the taste, which parches the mouth, while at the same time the flavour is most delicious. The price of spikenard is 100 denarii per pound.

C. 28. The grape of the amomum[129] is in common use. It grows on a wild vine which is found in India, or, as others think, on a shrub produced on the mountains which rises to the height of a palm-tree. It is plucked along with

the root, and is gently pressed together by the hands, for it very quickly becomes brittle. That kind is most esteemed which has leaves closely resembling those of the pomegranate, being without wrinkles and of a red colour. The second quality is that which is distinguished by the paleness of its colour. An inferior kind has a grassy appearance, and the white is the worst of all. This is its colour when old. The price of the amomum grape is sixty denarii per pound, but when crumbled it sells at forty-nine only.

Cardamom:

C. (29) Similar to these (amomum and amomis), both in name and the nature of the shrub, is cardamomum, the seed of which is of an oblong shape.[130] It is gathered in the same way both in India and Arabia. There are four sorts of it. That which is most esteemed is very green in the colour, unctuous, with sharp angles which make it hard to break; the next quality is of a reddish white tint – the third is shorter and blacker, while the worst is mottled, friable, and has but a faint smell, which ought to be similar to costum when genuine. Cardamum grows also in Media. The price of the best kind is three denarii.

Indian import from Arabia:

C. 17 (38). In Arabia, too, the olive-tree distils a tear, with which the Indians prepare a medicament called by the Greeks *enhoemon*,[131] and said to be of singular efficacy in cicatrising wounds.

Pliny did not approve of imports of luxury goods:

C. 15 (41). At the very lowest computation, India, the Seres, and the Arabian peninsula drain from our empire yearly one hundred million of sesterces; so dearly we pay for our luxury and our women.

C.22 (48) Scented calamus, also, which grows in Arabia, is common to both India and Syria.[132]

Mangroves:

Book XIII, c. 25 (51). The officers of Alexander who navigated the Indian seas have left on record a description of a marine tree, the leaves of which are green while in the water, but which, as soon as they are taken out, are dried into salt. They have noticed also bulrushes of stone closely resembling the real, and found along the seashore. They found, besides, certain shrubs in the deep sea of the colour of an ox's horn, which sent out numerous branches and are red at the tips. These were brittle, and broke like glass when touched, but in the fire they turned red-hot like iron, though on cooling they resumed their natural colour. In the same region the tide covers the woods[133] which grow on the islands though the trees are of a greater height than the tallest planes and poplars. Their leaves, which never fall off, resemble those of the laurel, their flowers those of the violet both in colour and smell, and their berries those of the olive. These berries are of a pleasant fragrance, make their appearance in autumn, and fall from the trees in spring. The smaller trees are entirely covered by the sea. The tops of the tallest stand out of the water, and ships are fastened to them, but when the tide ebbs they are fastened to the roots. We learn from the same authorities that they saw out in the same sea other trees which always retained their leaves and produced a fruit like the lupine.

Coconut palm:

Book XIV. c. 16 (19). The fruit of the palm is employed for this purpose (making wine) by the Parthians as well as the Indians, and indeed throughout all the countries of the East.

Book XV. c.7 (7) The Indians are said to extract oils from the chestnut, sesamum, and rice, and the Ichthyophagi from fish.

Book XVIII, c. 10 (22) Sesame comes from India, where they extract an oil[134] from it. The grain is of a white colour.

C. 13. In India there is both a cultivated and a wild barley, from which they make excellent bread as well as a kind of pottage. But their favourite diet is rice, from which a *ptisan* is prepared like that which is elsewhere made from barley. The leaves of the rice-plant are fleshy, and similar to those of the leek but broader; the plant itself is a cubit in height, the blossom is purple, and the root is round like a pearl.

INDIAN MINERALS AND PRECIOUS STONES

Salt mountains:

Book XXXI. C. 7 (39) There are mountains also formed of native salt, as, for instance, Ormenus[135], in India, where it is cut out like blocks from a quarry and is continually reproduced, whence a greater revenue accrues to the sovereigns of the country than they derive from gold and pearls.

Indian coral and oysters:

Book XXXII. C. 2 (11) Among the people of India as high a value is set upon coral as in our part of the world is set upon Indian pearls… The berries of coral are no less appreciated by the men of India than are Indian pearls by women among us. Their soothsayers and prophets regard coral as the most sacred of amulets ensuring protection against all dangers, so highly do they value it both as an ornament and an object of devotion.

C. 6 (21) According to the historians of the expedition of Alexander, oysters were found in the Indian Sea a foot in diameter.

Indigo:

C. 13 (57). It is not long since indicum[136] began to be imported, its price being 17 denarii per pound.

Book XXXV. C. 6 (27) Indicum is tested by placing it on hot coals, when, if it be genuine, it gives out a fine purple flame, and while smoking, a scent as of rocks near the shore. The price of indicum is twenty sesterces per pound. If used as a medicine, indicum acts as a sedative for ague and other shivering fits and desiccated sores.

Mineral wealth of India:

Book XXXVII. C. 1 (9) The East, too, sends us crystals, there being none preferred to the Indian kind.

C. 2 (11). Amber is found in India, where it is preferable substitute for frankincense. Ctesias says that in India is a river, the Hypobarus, and that the meaning of its name is the bearer of all good things – that it flows from

the north into the eastern Ocean near a mountain covered with trees that produce amber (electron),[137] and that these trees are called *aphytacoroe,* a name signifying *luscious sweetness*.

C. 4. (15) At the present day, for the first time six varieties of the diamond (adamas) are recognised. The Indian diamond is not found embedded in gold, but in a substance akin to crystals, which it equals in transparency and resembles in having six angles and six highly polished equal sides, while it is turbinated to a point at either extremity, just as if two cones should, to our wonder, be conjoined at their bases. As for size, it is as large even as a hazel nut.[138]

C. 4 (16) Next in esteem with us (to diamonds) are the pearls of India and Arabia.

C. 5. (20). It is thought by many that beryls are of the same, or at all events of a like nature with emeralds. India produces them, and they are rarely found elsewhere…. The Indians take a marvellous pleasure in beryls that are distinguished by their great length, and say that these are the only precious stones which they prefer to wear without gold; and hence, after piercing them, they string them upon elephant bristles. It is agreed that those beryls which are of perfect quality should not be perforated, but should merely be clasped at their extremities with circlets of gold. They prefer therefore to cut them into the form of a cylinder rather than to set them as precious stones, since those that are of greatest length are most in fashion. Some are of opinion that beryls are naturally angular, and that piercing them adds to their splendour in consequence of the removal of the white substance within, while the reflection of the gold still further brightens their brilliancy, and their thickness no longer mars their transparency…

C. 6 (21) Opals are at once very like and very unlike beryls, and are inferior in value to emeralds alone. India, too, is the sole mother of these precious stones,[139] thus completing her glory as being the great producer of the most costly gems.

C. 6 (22). This stone (opal), on account of its extraordinary beauty, has been called by many authors *paderos* (lovely youth); such as make a distinct species of it say that it is the gem called by the people of India *sangenon.*

C. 6 (23). By sardonyx, as the name itself implies, was formerly meant a *sarda* with a whiteness in it, like the flesh under the human finger-nail, the white part being transparent like the rest of the stone;[140] and that this was the character of the Indian sardonyx is stated by Ismenias, Demostratus, Zenothemis, and Sotacus. The last two give the name of *blind* sardonyx to all the other stones of this class which are not transparent, and which have now monopolised the name… Zenothemis writes that these stones were not held in esteem by the Indians, and that some were so large that the hilts of swords were made of them. It is well known that in that country they are laid bare to view by the mountain streams, and that in our part of the world they were at the outset prized from the fact that they were almost the only ones among engraved precious stones that do not take away the wax with them from an impression. We have in consequence taught the Indians themselves by the force of our example to value these stones, and the lower classes more particularly pierce them and wear them round the neck; and this is now a proof that a sardonyx is of Indian origin.

c. 6 (24). Zenothemis says there are numerous varieties of the Indian *onyx*,[141] the fiery-coloured, the black, the cornel with white veins encircling them like an eye, and in some cases running across them obliquely. The real onyx, he points out, has numerous veins of varying colours, along with streaks of a milk-white hue, and as these colours harmoniously shade into each other they produce, by their combinations, a tint of a beauty which is inexpressibly charming.

C. 7 (29) To the same class of flame-coloured stones belongs that known as the *lychnis*,[142] so called because its lustre is enhanced by lamplight, and when so seen is particularly pleasing. It is found in the neighbourhood of Orthosia and all over Caria and the adjoining localities, but the most approved stones are those which come from India.

C. 7 (31) In India three varieties of the Sarda[143] are found: the red Sarda, the one called from its thickness *pionia,* and a third kind beneath which they place a ground of silver foil. The Indian stones are transparent, those of Arabia more opaque.

C. 8 (40) We shall now treat of precious stones of a purple colour or of shades of purple. Among these, Indian amethysts hold the foremost

place…. The Indian kind exhibits in absolute perfection the loveliest shade of purple. It is the greatest ambition of the dyer in purple to attain this hue, for it gleams with a tender radiance which does not dazzle one's eyes like the colours of the carbuncle. Another kind approaches the hyacinth in colour, and this hue the Indians call *socon* and the stone itself *socondion*.

C. 9 (42) Aethiopia produces hyacinths – also chrysoliths – transparent stones of a golden brilliancy. The stones of India are preferred to these… The best are those which, when placed beside gold, give it a whitish appearance like silver.

C. 9 (45) The same country produces also *Xuthon* (Xanthon, yellow), a gem worn by the common people there.

C. 9 (48) Similarly white is the stone called *Astrion*,[144] which closely resembles crystal, and is found in India on the shores of Patalene. In the centre of it there shines a star with a refulgence like that of the moon when full.

C. 10. The agates found in India possess like marvellous properties with those found elsewhere, besides great and marvellous properties peculiar to themselves, for they exhibit the appearance of rivers, groves, beasts of burden… and horse trappings.[145]

C. 10 (56) Corallis, which is product of India and Syene, resembles minium (vermilion) in appearance… Chelonia is the eye of the Indian tortoise.[146] This stone gets its name from 'a tortoise.' Pliny says it was used by magicians for divination.

C. 10 (60) Haematitis is a stone of a blood-red colour… There is another of the same kind called *Menui* by the Indians, and *Xanthos* by the Greeks – being of a whitish tawny colour.

C. 10 (61) *Indica* retains the name of the country which produces it. It is a stone of a reddish colour, but when rubbed it exudes a liquid of a purple hue. There is another stone of this name which is white and of a dusty appearance. *Ion* is an Indian stone of a violet tint, which, however, is seldom found to shine with a full rich lustre.

❑

.

CHAPTER — 5

ARRIAN

The Greek historian and philosopher Arrian (Flavius Arrianus) was born about AD 96. He served the Roman Emperor Hadrian as legatus (Governor) of Cappadocia from AD 181 to 187, and distinguished himself in a military expedition to the Alani. His principal work, the *Anabasis of Alexander*, describes Alexander's life from his accession to his death. The passages selected are self-explanatory and concern the invasion of India.[147] Arrian sources his information from the writings of Aristobulus of Cassandreia and Ptolemy, son of Lagus, who later became King of Egypt. As both men accompanied Alexander, the *Anabasis* may be considered as credible a contemporary account as possible.

THE ANABASIS OF ALEXANDER

BOOK IV, CHAPTER XXII

Alexander reaches the river Cabul, and receives the homage of Taxiles:

…Arriving at the city of Nicaea, he offered sacrifice to Athena and then advanced towards the Cophen, sending a herald forward to Taxiles and the other chiefs on this side the river Indus, to bid them come and meet him as each might find it convenient. Taxiles and the other chiefs accordingly did come to meet him, bringing the gifts which are reckoned of most value among the Indians. They said that they would also present to him the elephants which they had with them, twenty-five in number. There he divided his army, and sent Hephaestion and Perdiccas away into the land of Peucelaotis, towards the river Indus with the brigades of Gorgias, Clitus, and Meleager, half of the Companion cavalry, and all the cavalry of the Grecian mercenaries. He gave them instructions either to capture the places on their route by force, or to bring them over on terms of capitulation; and when they reached the river Indus, to make the necessary preparations for the passage of the army. With them Taxiles and the other chiefs also marched. When they reached the river Indus they carried out all Alexander's orders…

CHAPTER XXV

The Aspasians[148] *are routed despite superior numbers due to Alexander's superior military tactics; Alexander is wounded on the shoulder; Macedonians massacre inhabitants fleeing for safety:*

Ptolemy indeed says that all the men were captured, to a number exceeding 40,000, and that over 230,000 oxen were also taken, of which Alexander picked out the finest, because they seemed to him to excel both in beauty and size wishing to send them into Macedonia to till the soil.

Thence he marched towards the land of the Assacenians;[149] for he received news that these people had made preparations to fight him, having 20,000 cavalry, more than 30,000 infantry, and 300 elephants.

CHAPTER XXVII

Alexander's strategic planning turns the tide in his favour at Massaga after four days of intense fighting during which he gets an arrow wound in his ankle; the survivors are massacred:

… The Indians, as long as the ruler of the place survived, defended themselves gallantly; but when he was struck and killed with a missile hurled from an engine, and as some of their number had fallen in the siege, which had gone on without any cessation, while most of them were wounded and unfit for service, they sent a herald to Alexander. He was glad to preserve the lives of brave men; so he came to terms with the Indian mercenaries on this condition, that they should be admitted into the ranks with the rest of his army and serve as his soldiers.

They therefore came out of the city with their arms and encamped by themselves upon a hill which was facing the camp of the Macedonians; but they resolved to arise by night and run away to their own abodes, because they were unwilling to take up arms against the other Indians. When Alexander received intelligence of this, he placed the whole of his army round the hill in the night, and intercepting them in the midst of their flight, cut them to pieces. He then took the city by storm, denuded as it was of defenders; and captured the mother and daughter of Assacenus…

Thence he dispatched Coenus to Bazira, entertaining an opinion that the inhabitants would surrender, when they heard of the capture of Massaga. He also dispatched Attalus, Alcetas, and Demetrius, the cavalry officer, to

another city, named Ora, with instructions to blockade it until he himself arrived. … The siege of Ora proved an easy matter to Alexander, for he no sooner attacked the walls than at the first assault he got possession of the city, and captured the elephants which had been left there.

CHAPTER XXVIII

Capture of Bazira—Advance to the Rock of Aornus:

When the men in Bazira heard this news, despairing of their own affairs, they abandoned the city about the middle of the night, and fled to the rock… For all the inhabitants deserted the cities and began to flee to the rock…called Aornus. For stupendous is this rock in this land, about which the current report is, that it was found impregnable even by Heracles, the son of Zeus.... The circuit of the rock is said to be about 200 stades (i.e. about twenty-three miles) and its height where it is lowest, eleven stades (i.e. about a mile and a quarter). There was only one ascent, which was artificial and difficult; on the summit of the rock there was abundance of pure water, a spring issuing from the ground, from which the water flowed; and there was also timber, and sufficient good arable land for 1,000 men to till. When Alexander heard this, he was seized with a vehement desire to capture this mountain also, especially on account of the legend which was current about Heracles... (*the rock is captured after a siege and the occupants massacred*).

BOOK V, CHAPTER I

Alexander at Nysa:

Alexander spares Nysa because it was founded by the Greek god Dionysus:

In this country, lying between the rivers Cophen and Indus, which was traversed by Alexander, the city of Nysa is said to be situated…. When Alexander came to Nysa the citizens sent out to him their president, whose name was Acuphis, accompanied by thirty of their most distinguished men as envoys, to entreat Alexander to leave their city free for the sake of the god. The envoys entered Alexander’s tent… Acuphis began thus to speak

“The Nysaeans beseech thee, 0 king, out of respect for Dionysus, to allow them to remain free and independent; for when Dionysus had subjugated the nation of the Indians, and was returning to the Grecian sea, he founded this city from the soldiers who had become unfit for military service, and were under his inspiration as Bacchanals, so that it might be a monument both of his wandering and of his victory to men of after times... From that time we inhabit Nysa, a free city, and we ourselves are independent, conducting our government with constitutional order. And let this be to thee a proof that our city owes its foundation to Dionysus; for ivy, which does not grow in the rest of the country of India, grows among us.”

CHAPTER II

Alexander at Nysa:

All this was very pleasant to Alexander to hear; for he wished that the legend about the wandering of Dionysus should be believed, as well as that Nysa owed its foundation to that deity, since he had himself reached the place where Dionysus came, and had even advanced beyond the limits of the latter’s march. He also thought that the Macedonians would not decline still to share his labours if he advanced further, from a desire to surpass the achievement of Dionysus. He therefore granted the inhabitants of Nysa the privilege of remaining free and independent; and when he heard about their laws, and that the Government was in the hands of the aristocracy, he commended these things. … He [appointed] Acuphis…Governor of the land of Nysaea.

CHAPTER III

Incredulity of Eratosthenes - Passage of the Indus:

When Alexander arrived at the river Indus, he found a bridge made over it by Hephaestion, and two thirty-oared galleys, besides many smaller crafts. He moreover found that 200 talents of silver, 3,000 oxen, above 10,000 sheep for sacrificial victims, and thirty elephants had arrived as gifts from Taxiles the Indian; 700 Indian horsemen also arrived from Taxiles as a reinforcement, and that prince sent word that he would surrender to him the

city of Taxila, the largest town between the river Indus and Hydaspes. Alexander there offered sacrifice to the gods to whom he was in the habit of sacrificing, and celebrated a gymnastic and horse contest near the river.

CHAPTER VIII

March from the Indus to the Hydaspes:

When Alexander had crossed to the other side of the river Indus, he again offered sacrifice there, according to his custom. Then starting from the Indus, he arrived at Taxila, a large and prosperous city, in fact the largest of those situated between the rivers Indus and Hydaspes. He was received in a friendly manner by Taxiles, the governor of the city, and by the Indians of that place; and he added to their territory as much of the adjacent country as they asked for. Thither also came to him envoys from Abisares, king of the mountaineer Indians, the embassy including the brother of Abisares as well as the other most notable men. Other envoys also came from Doxares, the chief of the province, bringing gifts with them. Here again at Taxila Alexander offered the sacrifices which were customary for him to offer, and celebrated a gymnastic and equestrian contest. Having appointed Philip, son of Machatas, viceroy of the Indians of that district, he left a garrison in Taxila, as well as the soldiers who were invalided by sickness, and then marched towards the river Hydaspes. For he was informed that Porus, with the whole of his army, was on the other side of river, having determined either to prevent him from making the passage, or to attack him while crossing... Alexander took the forces which he had when he arrived at Taxila, and the 5,000 Indians under the command of Taxiles and the chiefs of that district, and marched towards the same river.

CHAPTER IX

Porus obstructs Alexander's passage:

Alexander encamped on the bank of the Hydaspes, and Porus was seen with all his army and his large troops of elephants lining the opposite bank. He remained to guard the passage at the place where he saw Alexander had encamped; and sent guards to all the other parts of the river which were

more easily fordable, placing officers over each detachment, being resolved to obstruct the passage of the Macedonians. When Alexander saw this, he thought it advisable to move his army in various directions, to distract the attention of Porus, and render him uncertain what to do… Porus was not allowed to keep at rest, or to bring his preparations together from all sides to any one point if he selected this as suitable for the defence of the passage…

CHAPTER XI

Alexander's stratagem to get across:

There was in the bank of the Hydaspes, a projecting point, where the river makes a remarkable bend. It was densely covered by a grove of all sorts of trees; and over against it in the river was a woody island without a foot-track on account of its being uninhabited. Perceiving that this island was right in front of the projecting point, and that both the spots were woody and adapted to conceal his attempt to cross the river, he resolved to convey his army over at this place…. He gave Craterus orders not to cross the river before Porus moved off with his forces against them, or before he ascertained that Porus was in flight and that they were victorious. "If however," said he, 'Porus should take only a part of his army and march against me, and leave the other part with the elephants in his camp, in that case do thou also remain in thy present position. But if he leads all his elephants with him against me, and a part of the rest of his army is left behind in the camp, then do thou cross the river with all speed. For it is the elephants alone," said he, "which render it impossible for the horses to land on the other bank. The rest of the army can easily cross."

CHAPTER XI

Passage of the Hydaspes:

[Alexander] …made a secret march keeping far away from the bank of the river, in order not to be seen marching towards the island and headland, from which he had determined to cross… In the night a furious storm of rain occurred, on account of which his preparations and attempt to cross

were still less observed, since the claps of thunder and the storm drowned with their din the clatter of the weapons and the noise which arose from the orders given by the officers…. At the approach of day light, both the wind and the rain calmed down; and the rest of the army crossed over in the direction of the island… They went so secretly that they were not observed by the sentinels posted by Porus, before they had already got beyond the island and were only a little way from the other bank.

CHAPTER XV

Arrangement of Porus:

…. Porus…preferred to march against Alexander himself with all his army, and to come into a decisive conflict with the strongest division of the Macedonians, commanded by the king in person. But nevertheless he left a few of the elephants together with a small army there at the camp to frighten the cavalry under Craterus from the bank of the river. He then took all his cavalry to the number of 4,000 men, all his chariots to the number of 300 with 200 of his elephants, and all the infantry available to the number of 30,000, and marched against Alexander. When he found a place where he saw there was no clay, but that on account of the sand the ground was all level and hard, and thus fit for the advance and retreat of horses, he there drew up his army…

CHAPTER XVIII

Losses of the Combatants - Porus Surrenders:

… Of the Indians little short of 20,000 infantry and 3,000 cavalry were killed in this battle. All their chariots were broken to pieces; and two sons of Porus were slain, as were also Spitaces, the governor of the Indians of that district, the managers of the elephants and of the chariots and all the cavalry officers and generals of Porus' army. All the elephants which were not killed there were captured. Of Alexander's forces, about 80 of the 6,000 foot-soldiers who were engaged in the first attack were killed; 10 of the horse-archers, who were also the first to engage in the action; about 20 of the Companion cavalry, and about 200 of the other horsemen fell. When

Porus, who exhibited great talent in the battle, performing the deeds not only of a general but also of a valiant soldier, observed the slaughter of his cavalry,…he did not depart as Darius the Great King did,…but as long as any body of Indians remained compact in the battle, he kept up the struggle. But at last, having received a wound on the right shoulder, which part of his body alone was unprotected during the battle, he wheeled round… Alexander, having seen that he was a great man and valiant in the battle, was very desirous of saving his life. He accordingly sent first to him Taxiles the Indian;… he kept on sending others in succession; and last of all Meroes…

CHAPTER XIX

Alliance with Porus - Death of Bucephalus:

When Alexander heard that Meroes was bringing Porus to him, he rode in front of the line with a few of the Companions to meet Porus; and stopping his horse, he admired his handsome figure and his stature, which reached somewhat above five cubits. He was also surprised that he did not seem to be cowed in spirit, but advanced to meet him as one brave man would meet another brave man, after having gallantly struggled in defence of his own kingdom against another king. Then indeed Alexander was the first to speak, bidding him say what treatment he would like to receive. The story goes that Porus replied "Treat me, O Alexander, in a kingly way!" Alexander, being pleased at the expression, said: "For my own sake, 0 Porus, thou shall be thus treated; but for thy own sake do thou demand what is pleasing to thee!" But Porus said that everything was included in that. Alexander, being still more pleased at this remark, not only granted him the rule over his own Indians, but also added another country to that which he had before, of larger extent than the former. Thus he treated the brave man in a kingly way, and from that time found him faithful in all things.[150]

CHAPTER XXV

The Army Refuses to Advance - Alexander's speech to the officers:

It was reported that the country beyond the river Hyphasis was fertile, and that the men were good agriculturists, and gallant in war; and that they conducted their own political affairs in a regular and constitutional manner. For the multitude was ruled by the aristocracy, who governed in no respect contrary to the rules of moderation. It was stated that the men of that district possessed a much greater number of elephants than the other Indians, and that they were men of very great stature, and excelled in valour. These reports excited in Alexander an ardent desire to advance farther; but the spirit of the Macedonians now began to flag, when they saw the king raising one labour after another, and incurring one danger after another. Conferences were held throughout the camp… [in which the soldiers] resolutely declared that they would not follow Alexander any farther, even if he should lead the way. When he heard of this, before the disorder and pusillanimity of the soldiers should advance to a greater degree, he called a council of the officers of the brigades and addressed them as follows. "O Macedonians and Grecian allies, seeing that you no longer follow me into dangerous enterprises with a resolution equal to that which formerly animated you, I have collected you together into the same spot, so that I may be persuaded by you to return. If indeed the labours which you have already undergone up to our present position seem to you worthy of disapprobation, and if you did not approve of my leading you into them, there can be no advantages in my speaking any further. But if, as the result of these labours, you hold possession of Ionia, the Hellespont, both the Phrygias, Cappadocia, Paphlagonia, Lydia, Caria, Lycia, Pamphylia, Phoenicia, Egypt together with Grecian Libya, as well as part of Arabia, Hollow Syria, Syria between the rivers, Babylon, the nation of the Susians, Persia, Media, besides all the nations which the Persians and the Medes ruled, and many of those which they did not rule, the land beyond the Caspian Gates, the country beyond the Caucasus, the Tanias, as well as the land beyond that river, Bactria, Hyrcania, and the Hyrcanian Sea; if we have also subdued the Scythians as far as the desert; if, in addition to these, the river Indus flows through our territory, as do also the Hydaspes, the Acesines, and the Hydraotes, why do ye shrink from adding the Hyphasis[151] also, and the nations beyond this river, to your empire of Macedonia? Do ye fear that your advance will be stopped in the future by

any other barbarians? Of whom some submit to us of their own accord, and others are captured in the act of fleeing, while others, succeeding in their efforts to escape, hand over to us their deserted land, which we add to that of our allies, or to that of those who have voluntarily submitted to us.

CHAPTER XXVI

Alexander's speech (continued):

"I, for my part, think, that to a brave man there is no end to labours except the labours themselves, provided they lead to glorious achievements… But, if we now return, many warlike nations are left unconquered beyond the Hyphasis as far as the Eastern Sea, and many besides between these and Hyrcania in the direction of the north wind, and not far from these the Scythian races. Wherefore, if we go back, there is reason to fear that the races which are not held in subjection, not being firm in their allegiance, may be excited to revolt by those who are not yet subdued. Then our many labours will prove to have been in vain; or it will be necessary for us to incur over again fresh labours and dangers, as at the beginning…"

CHAPTER XXVII

The answer of Coenus:

When Alexander had uttered these remarks, and others in the same strain, a long silence ensued, for the auditors neither had the audacity to speak in opposition to the king without constraint, nor did they wish to acquiesce in his proposal. Hereupon, he repeatedly urged any one, who wished it, to speak, if he entertained different views from those which he had himself expressed…. at last, Coenus, son of Polemocrates, plucked up courage and spoke as follows:- '0 king, inasmuch as thou dost not wish to rule Macedonians by compulsion, but sayest thou wilt lead them by persuasion, or yielding to their persuasion wilt not use violence towards them, I am going to make a speech, not on my own behalf and that of my colleagues here present, who are held in greater honour than the other soldiers… but I am going to speak on behalf of the bulk of the army. On behalf of this army I am not going to say what may be gratifying to the men, but what I

consider to be both advantageous to thee at present, and safest for the future. I feel it incumbent upon me not to conceal what I think the best course to pursue, both on account of my age, the honour paid to me by the rest of the army at thy behest, and the boldness which I have without any hesitation displayed up to the present time in incurring dangers and undergoing labours. The more numerous and great the exploits have been, which have been achieved by thee as our commander, and by those who started from home with thee, the more advantageous does it seem to me that some end should be put to our labours and dangers. For thou thyself seest how many Macedonians and Greeks started with thee, and how few of us have been left. Of our number thou didst well in sending back home the Thessalians at once from Bactra, because thou didst perceive that they were no longer eager to undergo labours. Of the other Greeks, some have been settled as colonists in the cities which thou hast founded; where they remain, not indeed all of them of their own free will. The Macedonian soldiers and the other Greeks who still continued to share our labours and dangers, have either perished in the battles, become unfit for war on account of their wounds, or been left behind in the different parts of Asia. The majority, however, have perished from disease, so that few are left out of many; and these few are no longer equally vigorous in body; while in spirit they are much more exhausted... Do not lead us now against our will; for thou wilt no longer find us the same men in regard to dangers, since free-will will be wanting to us in the contests. But, rather, if it seems good to thee, return of thy own accord to thy own land, see thy mother, regulate the affairs of the Greeks, and carry to the home of thy fathers these victories, so many and great... Self-control in the midst of success is the noblest of all virtues, 0 king! For thou hast nothing to fear from enemies, while thou art commanding and leading such an army as this, but the visitations of the deity are unexpected, and consequently men can take no precautions against them."[152]

CHAPTER — 6

ARRIAN - INDIKA

Besides the *Anabasis of Alexander*, written in the Attic dialect, Arrian wrote a work on India in the Ionic dialect. Scholars believe he wished his work to supersede the older and less accurate account by Ktesias of Knidos, which was written in Ionic. The *Indika* comprises three parts:- a general description of India based mainly on accounts by Megasthenes and Eratosthenes (chaps. i.—xvii.); an account of Nearchus' voyage from the Indus to the Pasitigris based entirely on the latters' own narrative (chaps. xviii.—xlii); and a collection of proofs to show that the southern parts of the world are uninhabitable on account of the great heat (chap. xliii to the end). Our selections[153] are based upon what would be of interest to the contemporary reader.

General description of India:

II. Now the countries which lie to the east of the Indus I take to be India Proper, and the people who inhabit them to be Indians. The northern boundaries of India so defined are formed by Mount Taurus, though the range does not retain that name in these parts. Taurus begins from the sea which washes the coasts of Pamphylia, Lycia, and Cilicia, and stretches away towards the Eastern Sea, intersecting the whole continent of Asia. The range bears different names in the different countries which it traverses. In one place it is called Parapamisos, in another Emodos, and in a third Imaos, and it has perhaps other names besides. The Macedonians, again, who served with Alexander called it Caucasus, - this being another Caucasus and distinct from the Scythian (also Skythian) so that the story went that Alexander penetrated to the regions beyond Caucasus.

On the west the boundaries of India are marked by the river Indus all the way to the great ocean into which it pours its waters, which it does by two mouths. These mouths are not close to each other, like the five mouths of the Ister (Danube), but diverge like those of the Nile, by which the Egyptian delta is formed. The Indus in like manner makes an Indian delta, which is

not inferior in area to the Egyptian, and is called in the Indian tongue Pattala.

On the south-west, again, and on the south, India is bounded by the great ocean just mentioned, which also forms its boundary on the east. The parts toward the south about Pattala and the river Indus were seen by Alexander and many of the Greeks, but in an eastern direction Alexander did not penetrate beyond the river Hyphasis, though a few authors have described the country as far as the river Ganges and the parts near its mouths and the city of Palimbothra, which is the greatest in India, and situated near the Ganges.

Arrian discusses the implausible dimensions of India given by Greek writers, the confusion about whether her length is from north to south and breadth from east to west, or vice versa, and the great rivers:

III. … But, whatever be its dimensions, the rivers of India are certainly the largest to be found in all Asia. The mightiest are the Ganges and the Indus, from which the country receives its name. Both are greater than the Egyptian Nile and the Scythian Ister even if their streams were united into one.

Indians do not invade other nations:

V. [Megasthenes] asserts that there are eight-and-fifty Indian rivers which are all of them navigable. But even Megasthenes so far as appears, did not travel over much of India, though no doubt he saw more of it than those who came with Alexander the son of Philip, for, as he tells us, he resided at the court of Sandracottus, the greatest king in India, and also at the court of Porus, who was still greater than he. This same Megasthenes then informs us that the Indians neither invade other men, nor do other men invade the Indians for Sesostris the Egyptian, after having overrun the greater part of Asia, and advanced with his army as far as Europe, returned home; and Idanthyrsos the Skythian issuing from Skythia, subdued many nations of Asia, and carried his victorious arms even to the borders of Egypt; and Semiramis, again, the Assyrian queen, took in hand an expedition against India, but died before she could execute her design; and thus Alexander was the only conqueror who actually invaded the country.

Indian monsoon, river creatures, physical features:

VI. … Rain falls in India during the summer, especially on the mountains Parapamisos and Emodos and the range of Imaos, and the rivers which issue from these are large and muddy. Rain during the same season falls also on the plains of India, so that much of the country is submerged: and indeed the army of Alexander was obliged at the time of midsummer to retreat in haste from the Acesines, because its waters overflowed the adjacent plain… the Indian rivers, like the Nile in Ethiopia and Egypt, breed crocodiles, while some of them have fish and monstrous creatures such as are found in the Nile, with the exception only of the hippopotamus, though Onesikritus asserts that they breed this animal also. With regard to the inhabitants, there is no great difference in type of figure between the Indians and the Ethiopians, though the Indians, no doubt, who live in the south-west bear a somewhat closer resemblance to the Ethiopians, being of black complexion and black-haired, though they are not so snub-nosed nor have the hair so curly; while the Indians who live further to the north are in person like the Egyptians.

On pearl mining:

VIII. Megasthenes informs us that the oyster which yields this pearl is there fished for with nets, and that in these same parts the oysters live in the sea in shoals like bee-swarms: for oysters, like bees, have a king or a queen, and if any one is lucky enough to catch the king he readily encloses in the net all the rest of the shoal, but if the king makes his escape there is no chance that the others can be caught. The fishermen allow the fleshy parts of such as they catch to rot away, and keep the bone, which forms the ornament: for the pearl in India is worth thrice its weight in refined gold, gold being a product of the Indian mines.

Alexander only conqueror of India; Indians do not conquer out of sense of justice:

IX. …From the time of Dionysus to Sandracottus the Indians counted 153 kings and a period of 6042 years, but among these a republic was thrice established * * * * and another to 300 years, and another to 120 years. The Indians also tell us that Dionysus was earlier than Heracles by fifteen

generations, and that except him no one made a hostile invasion of India, even Cyrus the son of Cambyses, although he undertook an expedition against the Scythians, and otherwise showed himself the most enterprising monarch in all Asia; but that Alexander indeed came and overthrew in war all whom he attacked, and would even have conquered the whole world had his army been willing to follow him. On the other hand, a sense of justice, they say, prevented any Indian king from attempting conquest beyond the limits of India.

Indians remember the dead in deeds; cities of India, especially Pataliputra (Patna):

X. It is further said that the Indians do not rear monuments to the dead, but consider the virtues which men have displayed in life, and the songs in which their praises are celebrated, sufficient to preserve their memory after death. But of their cities it is said that the number is so great that it cannot be stated with precision, but that such cities as are situated on the banks of rivers or on the sea-coast are built of wood, for were they built of brick they would not last long – so destructive are the rains, and also the rivers when they overflow their banks and inundate the plains; those cities, however, which stand on commanding situations and lofty eminences are built of brick and mud. The greatest city in India is that which is called Palimbothra, in the dominions of the Prasians, where the streams of the Erannoboas and the Ganges unite – the Ganges being the greatest of all rivers, and the Erannoboas being perhaps the third largest of Indian rivers, though greater than the greatest rivers elsewhere; but it is smaller than the Ganges where it falls into it. Megasthenes says further of this city that the inhabited part of it stretched on either side to an extreme length of eighty stadia, and that its breadth was fifteen stadia, and that a ditch encompassed it all round, which was six plethra in breadth and thirty cubits in depth, and that the wall was crowned with five hundred and seventy towers and had four-and-sixty gates. The same writer tells us further this remarkable fact about India, that all the Indians are free, and not one of them is a slave. The Lakedaimonians, however, hold the Helots as slaves, and these Helots do servile labour; but the Indians do not even use aliens as slaves, and much less a countryman of their own.[154]

Tigers, parrots, apes, snakes:

XV. But the tiger the Indians regard as a much more powerful animal than the elephant. Nearchus tells us that he had seen the skin of a tiger, though the tiger itself he had not seen. The Indians, however, informed him that the tiger equals in size the largest horse, but that for swiftness and strength no other animal can be compared with it: for that the tiger, when it encounters the elephant, leaps up upon the head of the elephant and strangles it with ease; but that those animals which we ourselves see and call tiger are but jackals with spotted skins and larger than other jackals. …

But about parrots Nearchus writes as if they were a new curiosity, and tells us that they are indigenous to India, and what-like they are, and that they speak with a human voice; but since I have myself seen many parrots, and know others who are acquainted with the bird, I will say nothing about it as if it were still unfamiliar. Nor will I say aught of the apes, either touching their size, or the beauty which distinguishes them in India, or the mode in which they are hunted, for I should only be stating what is well known, except perhaps the fact that they are beautiful.

Regarding snakes, too, Nearchus tells us that they are caught in the country, being spotted, and nimble in their movements, and that one which Peitho the son of Antigenes caught measured about sixteen cubits, though the Indians allege that the largest snakes are much larger. But no cure of the bite of the Indian snake has been found out by any of the Greek physicians, though the Indians, it is certain, can cure those who have been bitten. And Nearchus adds this, that Alexander had all the most skilful of the Indians in the healing art collected around him, and had caused proclamation to be made throughout the camp that if any one were bitten he should repair to the royal tent; but these very same men were able to cure other diseases and pains also. With many bodily pains, however, the Indians are not afflicted, because in their country the seasons are genial. In the case of an attack of severe pain they consult the sophists, and these seemed to cure whatever diseases could be cured not without divine help.

Cotton clothing, jewellery, dyes, footwear, and war weapons:

XVI. The dress worn by the Indians is made of cotton, as Nearchus tells us, cotton produced from those trees of which mention has already been

made. But this cotton is either of a brighter white colour than any cotton found elsewhere, or the darkness of the Indian complexion makes their apparel look so much the whiter. They wear an under-garment of cotton which reaches below the knee halfway down to the ankles, and also an upper garment which they throw partly over their shoulders and partly twist in folds round their head. The Indians wear also earrings of ivory, but only such of them do this as are very wealthy, for all Indians do not wear them. Their beards, Nearchus tells us, they dye of one hue and another, according to taste. Some dye their white beards to make them look as white as possible, but others dye them blue; while some again prefer a red tint, some a purple, and others a rank green. Such Indians, he also says, as are thought anything of, use parasols as a screen from the heat. They wear shoes made of white leather, and these are elaborately trimmed, while the soles are variegated, and made of great thickness, to make the wearer seem so much the taller.

I proceed now to describe the mode in which the Indians equip themselves for war, premising that it is not to be regarded as the only one in vogue. The foot-soldiers carry a bow made of equal length with the man who bears it. This they rest upon the ground, and pressing against it with their left foot thus discharge the arrow, having drawn the string far backwards: for the shaft they use is little short of being three yards long, and there is nothing which can resist an Indian archer's shot - neither shield nor breastplate, nor any stronger defence if such there be. In their left hand they carry bucklers made of undressed ox-hide, which are not so broad as those who carry them, but are about as long. Some are equipped with javelins instead of bows, but all wear a sword, which is broad in the blade, but not longer than three cubits; and this, when they engage in close fight (which they do with reluctance), they wield with both hands, to fetch down a lustier blow. The horsemen are equipped with two lances like the lances called *saunia*, and with a shorter buckler than that carried by the foot-soldiers. But they do not put saddles on their horses, nor do they curb them with bits like the bits in use among the Greeks or the Celts, but they fit on round the extremity of the horse's mouth a circular piece of stitched raw ox-hide studded with pricks of iron or brass pointing inwards, but not very sharp: if a man is rich he uses pricks made of ivory. Within the horse's mouth is put an iron prong like a skewer, to which the reins are attached. When the rider, then, pulls the

reins, the prong controls the horse, and the pricks which are attached to this prong goad the mouth, so that it cannot but obey the reins.

Importance of elephants for social status, absence of dowry in marriage:

XVII. The Indians are in person slender and tall, and of much lighter weight than other men. The animals used by the common sort for riding on are camels and horses and asses, while the wealthy use elephants, - for it is the elephant which in India carries royalty. The conveyance which ranks next in honour is the chariot and four; the camel ranks third; while to be drawn by a single horse is considered no distinction at all. But Indian women, if possessed of uncommon discretion, would not stray from virtue for any reward short of an elephant, but on receiving this a lady lets the giver enjoy her person. Nor do the Indians consider it any disgrace to a woman to grant her favours for an elephant, but it is rather regarded as a high compliment to the sex that their charms should be deemed worth an elephant. They marry without either giving or taking dowries, but the women, as soon as they are marriageable, are brought forward by their fathers and exposed in public, to be selected by the victor in wrestling or boxing or running, or by some one who excels in any other manly exercise. The people of India live upon grain, and are tillers of the soil; but we must except the hillmen, who eat the flesh of beasts of chase.

It is sufficient for me to have set forth these facts regarding the Indians, which, as the best known, both Nearchus and Megasthenes, two men of approved character, have recorded.

❑

.

CHAPTER — 7

PERIPLUS MARIS ERYTHRAEI

The circumnavigation, or *Periplus of the Erythraean Sea*,[155] is the best account of the trade from the Red Sea and coast of Africa to the East Indies, when Egypt was a province of the Roman empire. The Erythraean Sea included the whole ocean from the coast of Africa to the utmost eastern boundary then known, and was so called because the Greeks called the Red Sea straits as Erythra; it included the Persian Gulf. Its anonymous author was a Greek merchant of the first century AD, settled at Berenike, a seaport in the southern extremity of Egypt, from where he made commercial voyages to the seaports of Eastern Africa as far as Azania, to Arabia as far as Kane, and via the south-west monsoon to the western shores of India. He penned his carefully acquired knowledge about the navigation and commerce of these coastlines for the benefit of other merchants. The accuracy and utility of the information makes it a valuable source about the marts of ancient India [Translated from the text as given in the *Geographi Graeci Minores*, ed. C. Muller: Paris, 1855].

II. ARTICLES OF COMMERCE MENTIONED IN THE *PERIPLUS*

Animal Products:

1. Butter, or the Indian preparation therefrom called *ghi*, a product of Ariake (41); exported from Barugaza (Gulf of Khambhat) to the Barbarine markets beyond the Straits (14).

2. Chinese hides or furs. Exported from Barbarikon, a mart on the Indus (39).

6. Coral. (Sans. *pravala,* Hindi *munga*.) Imported into Kane (28), Barbarikon on the Indus (39), Barugaza (49), and Naoura, Tundis, Mouziris, and Nelkunda (56).

7. Coloured lac. Exported to Adouli from Ariake (6). The Sanskrit word is *laksha*, which is probably a later form of *raksha*, connected, as Lassen thinks, with *raga*, from the root *ranj*, to dye. The vulgar form is *lakkha*.

Gum-lac is a substance produced on the leaves and branches of certain trees by an insect, both as a covering for its egg and food for its young. It yields a fine red dye.[156]

8. Pearl. (Sans. *mukta,* Hindi, *moti)* Exported in considerable quantity and of superior quality from Mouziris and Nelkunda (56).

9. Silk thread. From the country of the Thinai: imported into Barugaza and the marts of Dimurike (64). Exported from Barugaza (49), and also from Barbarikon on the Indus (39).

III. PLANTS AND THEIR PRODUCTS

1. The aloe (Sans. *agaru*). Exported from Kane (28). The sort referred to is probably the bitter cathartic, not the aromatic sort supposed by some to be the sandalwood. It grows abundantly in Sokotra, and it was no doubt exported thence to Kane.

4. Bdella, Bdellium, produced on the sea-coast of Gedrosia (37); exported from Barbarikon on the Indus (39); brought from the interior of India to Barugaza (48) for foreign export (49). Bdella[157] is the gum of the *Balsamodendron Mukul,* a tree growing in Sind, Kathiavad and the Disa district.

10. Indigo (Sans. *nili*). Exported from Skythic Barbarikon (39). It appears pretty certain that the culture of the indigo plants and the preparation of the drug have been practiced in India from a very remote epoch. It has been questioned, indeed, whether the Indicum mentioned by Pliny (xxxv.6) was indigo, but, as it would seem, without any good reason. He states that it was brought from India, and that when diluted it produced an admirable mixture of blue and purple colours… The dye was introduced into Rome only a little before Pliny's time.

12. Karpasus (Sans. *karpasa;* Heb. *karpas), Gossypium arboreum,* fine muslin – a product of Ariake (41).

13. (Sans. *kuta*, Heb. *kiddah* and *keziah*). Exported from Tabai (12); a coarse kind exported from Malao and Moundou (8, 9); a vast quantity exported from Mossulon and Opone (10, 13). "This spice," says Vincent, "is mentioned frequently in the *Periplus,* and with various additions, intended to specify the different sorts, properties, or appearances of the commodity. It is a species of cinnamon, and manifestly the same as what we

call cinnamon at this day; but different from that of the Greeks and Romans, which was not a bark, nor rolled up into pipes, like ours. Theirs was the tender shoot of the same plant, and of much higher value."

15. Kostus (Sans. *kushta*, Mar. *choka*, Guj. *katha* and *pushkara mula*). Exported from Barbarikon, a mart on the Indus (39), and from Barugaza, which procured it from Kabul through Proklais, &c. This was considered the best of aromatic roots, as nard or spikenard was the best of aromatic plants. Pliny (xii.25) describes this root as hot to the taste and of consummate fragrance, noting that it was found at the head of Patalene, where the Indus bifurcates to form the delta, and that it was of two sorts, black and white, black being of an inferior quality. Lassen states that two kinds are found in India – one in Multan, and the other in Kabul and Kasmir.

20. Lycium. Exported from Barbarikon in Indo-Skythia (39), and from Barugaza (49). Lycium is a thorny plant, so called from being found in Lykia principally. Its juice was used for dyeing yellow, and a liquor drawn from it was used as medicine. It was held in great esteem by the ancients. Pliny (xxiv. 77) says that a superior kind of Lycium produced in India was made from a thorn called also *Pyxacanthus* (box-thorn) *Chironia.* It is known in India as *Ruzot*, an extract of the *Berberis lyceum* and B. *aristata,* both grown on the Himalayas.

22. Macer. Exported from Malao and Moundou (8, 9). According to Pliny, Dioskorides, and others, it is an Indian bark – perhaps a kind of cassia. The bark is red and the root large. The bark was used as a medicine in dysenteries (Pliny xii. 8).

23. Malabathrum, Betel, (Sans. *tamalapattra*, leaf of the *Laurus Cassia*), obtained by the Thinai from the Sesatai and exported to India (65);[158] conveyed down the Ganges to Gange near its mouth (63); conveyed from the interior of India to Mouziris and Nelkunda for export (56)… Malabathrum was not only a masticatory, but also an unguent or perfume… From Ptolemy (VII. ii. 16) we learn that the best Malabathrum was produced in Kirrhadia – that is, Rangpur. Dioskorides speaks of it as a masticatory, and was aware of the confusion caused by mistaking the nard for the betel.

24. (Sans. *sarkara*, Prakrit *sakara,* Arab, *sukkar,* Latin *saccharum*) – Honey from canes, called Sugar. Exported from Barugaza to the marts of Barbaria (14). The first Western writer who mentions this article was Theophrastos, who continued the labours of Aristotle in natural history. He called it a sort of honey extracted from reeds. Strabo states, on the authority of Nearkhos, that reeds in India yield honey without bees. Aelian (*Hist. Anim.)* speaks of a kind of honey pressed from reeds which grew among the Prasii. Seneca (Epist.84) speaks of sugar as a kind of honey found in India on the leaves of reeds, which had either been dropped on them from the sky as dew, or had exuded from the reeds themselves. This was a prevalent error in ancient times, e.g. Dioskorides says that sugar is a sort of concreted honey found upon canes in India and Arabia Felix, and Pliny that it is collected from canes like a gum. He describes it as white and brittle between the teeth, of the size of a hazel-nut at most, and used in medicine only. So also Lucan, alluding to the Indians near the Ganges, says that they quaff sweet juices from tender reeds. Sugar, however, as is well known, must be extracted by art from the plant. It has been conjectured that the sugar described by Pliny and Dioskorides was sugar candy obtained from China.

29. (Sans. *nalada*, '*kaskas*,' Heb. *nerd*) Nard, Spikenard.[159] Gangetic spikenard brought down the Ganges to Gange, near its mouth (63), and forwarded thence to Mouziris and Nelkunda (56). Spikenard produced in the regions of the Upper Indus and in Indo-Skythia forwarded through Ozene (Ujjain) to Barugaza and Barbarikon in Indo-Skythia (49, 39).

The *Nardos* is a plant called (from its root being shaped like an ear of corn)… Latin *Spica nardi*, whence 'spikenard.' It belongs to the species *Valeriana*.

31. Muslin. Seric muslin sent from the Thinai to Barugaza and Dimurike (64). Coarse cottons produced in great quantity in Ariake, carried down from Ozene to Barugaza (48); large supplies sent thither from Tagara also (51); Indian muslins exported from the markets of Dimurike to Egypt (56). Muslins of every description, Seric and dyed of a mallow colour, exported from Barugaza to Egypt (49); Indian muslin taken to the island of Dioskorides (31); wide Indian muslin called *monakhe*, *I.E.* of the best and finest sort; and another sort…ie. coarse cotton unfit for spinning, and used

for stuffing beds, cushions, &c., exported from Barugaza to the Barbarine markets (14), and to Arabia, whence it was exported to Adouli (6).

35. (Sansk. *pippali,)* long pepper. Kottonarik pepper exported in large quantities from Mouziris and Nelkunda (56); long pepper from Barugaza (49). *Kottonara* was the name of the district, and *Kottonarikon* the name of the pepper for which the district was famous. Dr. Buchanan identifies Kottonara with Kadatta-Nadu, a district in the Calicut country celebrated for its pepper. Dr. Burnell, however, identifies it with Kolatta-Nadu, the district about Tellicherry, which, he says, is the pepper district.

41. The finest Bengal muslins exported from the Ganges (63); other muslins in Taprobane (61);… muslins of all sorts and mallow-tinted sent from Ozene to Barugaza (48), exported thence to Arabia for the supply of the market at Adouli (6).

IV. METALS AND METALLIC ARTICLES

4. Kaltis. A gold coin current in the district of the Lower Ganges (63); Benfey thinks the word is connected with the Sanskrit *kalita*, *I.E. numeratum*.

8. …Indian iron and sword-blades exported to Adouli from Arabia (Ariake?)… The Arabian poets celebrate swords made of Indian steel. … Indian iron is mentioned in the Pandects as an article of commerce.

V. STONES

1. Gems (carbuncles?) found in Taprobane (63); exported in every variety from Mouziris and Nelkunda (56).

2. Diamonds. (Sans. *vajra*, *piraka*). Exported from Mouziris and Nelkunda (56).

3. Gold-stone, yellow crystal, chrysolith? Exported from Barbarikon in Indo-Skythia (39). It is not a settled point what stone is meant. Lassen says that the Sanskrit word *kalyana* means *gold*, and would therefore identify it with the chrysolith or gold-stone…..

5. Onyx (*akika* – agate). Sent in vast quantities from Ozene and Paithana to Barugaza (48, 51), and thence exported to Egypt (49).

6. Fluor-spath. Sent from Ozene to Barugaza, and exported to Egypt (49). Porcelain made at Diospolis exported from Egypt to Adouli (6).

The reading of the MS….is to be understood *vitrum murrhinum*, a sort of china or porcelain made in imitation of cups or vases of *murrha*, a precious fossil-stone resembling, if not identical with, *fluor-spath*, such as is found in Derbyshire. Vessels of this stone were exported from India, and also, as we learn from Pliny, from Karmania, to the Roman market, where they fetched extravagant prices.[160]

8. The sapphire. Exported from Barbarikon in Indo-Skythia (39). "The ancients distinguished two sorts of dark blue or purple, one of which was spotted with gold."[161]

9. Hyacinth or Jacinth. Exported from Mouziris and Nelkunda (56). According to Salmasius this is the Ruby. In Solinus xxx. it would seem to be the Amethyst (Sans. *pushkaraja*).

10. Glass of a coarse kind. Exported from Egypt to Barugaza (49), to Mouziris and Nelkunda (56). Vessels of glass exported from Egypt to Barbarikon in Indo-Skythia (39). Crystal of many sorts exported from Egypt to Adouli, Aualities, Mossulon (6,7,10); from Mouza to Azania (17).

11. Chrysolite. Exported from Egypt to Barbarikon in Indo-Skythia (39), to Barugaza (43), to Mouziris and Nelkunda (56). Some take this to be the topaz (Hind. *piroja)*.

ANONYMI [ARRIANI UT FERTUR] PERIPLUS MARIS ERYTHRAEI

41. To the gulf of Barake succeeds that of Barugaza and the mainland of Ariake, a district which forms the frontier of the kingdom of Mombaros and of all India. The interior part of it which borders on Skythia is called Aberia, and its sea-board Surastrene.[162] It is a region which produces abundantly corn and rice and the oil of sesamum, butter, muslins and the coarser fabrics which are manufactured from Indian cotton. It has also numerous herds of cattle. The natives are men of large stature and coloured black. The metropolis of the district is Minnagar, from which cotton cloth is exported in great quantity to Barugaza. In this part of the country there are preserved even to this very day memorials of the expedition of Alexander, old temples, foundations of camps, and large wells. The extent of this coast,

reckoned from Barbarikon to the promontory called Papike,[163] near Astakapra, which is opposite Barugaza, is 3,000 stadia.

42. After Papike there is another gulf, exposed to the violence of the waves and running up to the north. Near its mouth is an island called Baiones, and at its very head it receives a vast river called the Mais. Those bound for Barugaza sail up this gulf (which has a breadth of about 300 stadia), leaving the island on the left till it is scarcely visible in the horizon, when they shape their course east for the mouth of the river that leads to Barugaza. This is called the Namnadios.[164]

43. The passage into the gulf of Barugaza is narrow and difficult to access to those approaching it from the sea, for they are carried either to the right or to the left, the left being the better passage of the two. On the right, at the very entrance of the gulf, lies a narrow stripe of shoal, rough and beset with rocks. It is called Herone, and lies in front of Astakapra, where it is difficult to anchor, from the strength of the current and because the cables are cut through by the sharp rocks at the bottom. But even if the passage into the gulf is secured the mouth of the Barugaza river is not easy to hit, since the coast is low and there are no certain marks to be seen until you are close upon them. Neither, if it is discovered, it is easy to enter, from the presence of shoals at the mouth of the river.

44. For this reason native fishermen appointed by Government are stationed with well-manned long boats called *trappaga* and *kotumba* at the entrance of the river, whence they go out as far as Surastrene to meet ships, and pilot them up to Barugaza…

45. India has everywhere a great abundance of rivers, and her seas ebb and flow with tides of extraordinary strength, which increase with the moon, both when new and when full, and for three days after each, but fall off in the intermediate space. About Barugaza they are more violent than elsewhere; so that all of a sudden you see the depths laid bare, and portions of the land turned into sea, and the sea, where ships were sailing but just before, turned without warning into dry land…

46. This is the reason why ships frequenting this emporium are exposed, both in coming and going, to great risk, if handled by those who are unacquainted with the navigation of the gulf or visit it for the first time,

since the impetuosity of the tide when it becomes full, having nothing to stem or slacken it, is such that anchors cannot hold against it…

48. In the same region eastward is a city called Ozene, formerly the capital wherein the king resided. From it there is brought down to Barugaza every commodity for the supply of the country and for export to our own markets – onyx-stones, porcelain, fine muslins, mallow-coloured muslins, and no small quantity of ordinary cottons. At the same time there is brought down to it from the upper country by way of Proklais, for transmission to the coast, Kattybournine, Patropapigic, and Kabalitic spikenard,[165] and another kind which reaches it by way of the adjacent province of Skythia; also kostus and bdellium.

49. The imports of Barugaza are –

- Brass or copper and Tin and Lead.
- Coral and Gold-stone *or* Yellow-stone.
- Cloth, plain and mixed, of all sorts.
- Variegated sashes half a yard wide.
- Storax.
- Sweet clover, melilot.
- White glass.
- Gum Sandarach.
- (Stibium) Tincture for the eyes,
- Gold and Silver specie, yielding a profit when exchanged for native money.
- Perfumes or unguents, neither costly nor in great quantity.

In those times, moreover, there were imported as presents to the king, costly silver vases, instruments of music, handsome young women for concubinage, superior wine, apparel, plain but costly, and the choicest unguents. The exports from this part of the country are-

- Spikenard, costus, bdellium, ivory.
- Onyx-stones and porcelain.
- Ruzot, Box-thorn.
- Cotton of all sorts.
- Silk.
- Mallow-coloured cottons.
- Silk thread.

• Long pepper and other articles supplied from the neighbouring ports.

The proper season to set sail for Barugaza from Egypt is the month of July, or Epiphi.

50. From Barugaza the coast immediately adjoining stretches from the north directly to the south, and the country is therefore called Dakhinabades (Deccan), because Dakhan in the language of the natives signifies *south*. Of this country that part which lies inland towards the east comprises a great space of desert country, and large mountains abounding with all kinds of wild animals, leopards, tigers, elephants, huge snakes, hyenas, and baboons of many different sorts, and is inhabited right across to the Ganges by many and extremely populous nations.

51. Among the marts in this South Country there are two of more particular importance – Paithana, which lies south from Barugaza, a distance of twenty days, and Tagara, ten days east of Paithana,[166] the greatest city in the country. Their commodities are carried down on wagons to Barugaza along roads of extreme difficulty, - that is, from Paithana a great quantity of onyx-stone, and from Tagara ordinary cottons in abundance, many sorts of muslins, mallow-coloured cottons, and other articles of local production brought into it from the parts along the coast. The length of the entire voyage as far as Limurike (Damirike, Tamil country) is 700 stadia, and to reach Aigialos you must sail very many stadia further.

52. The local marts which occur in order *along the coast* after Barugaza are Akabaron, Souppara, Kalliena, a city which was raised to the rank of a regular mart in the times of the elder Saraganes (Satakarni dynasty), but after Sandanes became its master its trade was put under the severest restrictions; for if Greek vessels, even by accident, enter its ports, a guard is put on board and they are taken to Barugaza.

53. After Kalliena other local marts occur…

54. To the kingdom under the sway of Keprobotras[167] Tundis is subject, a village of great note situate near the sea. Mouziris,[168] which pertains to the same realm, is a city at the height of prosperity, frequented as it is by ships from Ariake and Greek ships from Egypt. It lies near a river at a distance from Tundis of 500 stadia, whether this is measured from river to river or by the length of the sea voyage, and it is 20 stadia distant from the mouth of

its own river. The distance of Nelkunda[169] from Mouziris is also nearly 500 stadia, whether measured from river to river or by the sea voyage, but it belongs to a different kingdom, that of Pandion.[170] It likewise is situate near a river and at about a distance from the sea of 120 stadia.

55. At the very mouth of this river lies another village, Bakare, to which the ships dispatched from Nelkunda[171] come down *empty* and ride at anchor off shore while taking in cargo: for the river, it may be noted, has sunken reefs and shallows which make its navigation difficult. The sign by which those who come hither by sea know they are nearing land is their meeting with snakes, which are here of a black colour, not so long as those already mentioned, like serpents about the head, and with eyes the colour of blood.

56. The ships which frequent these ports are of a large size, on account of the great amount and bulkiness of the pepper and betel of which their lading consists. The imports here are principally –

- Great quantities of specie.
- Gold-stone, Chrysolite.
- A small assortment of plain cloth.
- Flowered robes.
- Stibium, a pigment for the eyes, coral.
- White glass, copper or brass.
- Tin, lead.
- Wine but not much, but about as much as at Barugaza.
- Sandarach (sindurd).
- Arsenic (Orpiment), yellow sulphuret of arsenic.
- Corn, only for the use of the ship's company, as the merchants do not sell it.

The following commodities are brought to it for export:

- Pepper in great quantity, produced in only one of these marts, and called the pepper of Kottonara.
- Pearls in great quantity and of superior quality.
- Ivory
- Fine silks.
- Spikenard from the Ganges.
- Betel – all brought from countries further east.
- Transparent or precious stones of all sorts.

• Diamonds.
• Jacinths.
• Tortoise-shell from the Golden Island, and another sort which is taken in the islands which lie off the coast of Limurike.

The proper season to set sail from Egypt for this part of India is about the month of July – that is, Epiphi.

57. The whole round of the voyage from Kane and Eduaimon Arabia, which we have just described, used to be performed in small vessels which kept close to shore and followed its windings, but Hippalos was the pilot who first, by observing the bearings of the ports and the configuration of the sea, discovered the direct course across the ocean; whence as, at the season when our own Etesians are blowing, a periodical wind from the ocean likewise blows in the Indian Sea, this wind, which is the south-west, is, it seems, called in these seas Hippalos [after the name of the pilot who first discovered the passage by means of it]. From the time of this discovery to the present day, merchants who sail for India either from Kane, or, as others do, from Aromata, if Limurike be their destination, must often change their tack, but if they are bound for Barugaza and Skythia, they are not retarded for more than three days, after which, committing themselves to the monsoon which blows right in the direction of their course, they stand far out to sea, leaving all the gulfs we have mentioned in the distance.

58. After Bakare occurs the mountain called Pyrrhos (Red) towards the south, near another district of the country called Paralia[172] (where king Pandion owns the pearl-fisheries), and a city of the name of Kolkhoi (Gulf of Mannar). In this tract the first place met with is called Balita, which has a good harbour and a village on its shore. Next to this is another place called Komar, where is the cape of the same name and a haven. Those who wish to consecrate the closing part of their lives to religion come hither and bathe and engage themselves to celibacy. This is also done by women; since it is related that the goddess (Kumari) once on a time resided at the place and bathed. From Komarei (towards the south) the country extends as far as Kolkhoi, where the fishing for pearls is carried on. Condemned criminals are employed in this service. King Pandion is the owner of the fishery. To Kolkhoi succeeds another coast lying along a gulf having a district in the interior bearing the name of Argalou. In this single place are obtained the

pearls collected near the island of Epiodoros. From it are exported the muslins called *ebargareitides*.

60. Among the marts and anchorages along this shore to which merchants from Limurike and the north resort, the most conspicuous are Kamara and Podouke (Puducherry) and Sopatma,[173] which occur in the order in which we have named them. In these marts are found those native vessels for coasting voyages which trade as far as Limurike, and another kind called *sangara*, made by fastening together large vessels formed each of a single timber, and also others called *kolandiophonta*, which are of great bulk and employed for voyages to Khruse and the Ganges. These marts import all the commodities which reach Limurike for commercial purposes, absorbing likewise nearly every species of goods brought from Egypt, and most descriptions of all the goods exported from Limurike and disposed of on this coast of India.

61. Near the region which succeeds, where the course of the voyage now bends to the east, there lies out in the open sea stretching towards the west the island now called Palaisimoundou, but by the ancients Taprobane (Sri Lanka).

62. (*Returning to the coast,*) not far from the three marts we have mentioned lies Masalia (Masulipatam), the seaboard of a country extending far inland. Here immense quantities of fine muslins are manufactured. From Masalia the course of the voyage lies eastward across a neighbouring bay to Desarene, which has the breed of elephants called Bosare. Leaving Desarene the course is northerly, passing a variety of barbarous tribes, among which are the Kirrhadai (Kiratas), savages whose noses are flattened to the face, and another tribe, that of the Bargusoi (of Nicobar Islands), as well as the Hippioprosopoi or Makroprosopoi (horse-faced or long-faced men), who are reported to be cannibals.

63. After passing these the course turns again to the east, and if you sail with the ocean to your right and the coast far to your left, you reach the Ganges and the extremity of the continent towards the east called Khruse (the Golden Khersonese). The river of this region called the Ganges is the largest in India; it has an annual increase and decrease like the Nile, and there is on it a mart called after it, Gange, through which passes a considerable traffic consisting of betel, the Gangetic spikenard, pearl, and

the finest of all muslins – those called the Gangetic. In this locality also there is said to be a gold mine and a gold coin called *Kaltis*. Near this river there is an island of the ocean called Khruse (Golden), which lies directly under the rising sun and at the extremity of the world towards the east. It produces the finest tortoise-shell that is found throughout the whole of the Erythraean Sea.

64. Beyond this region, immediately under the north, where the sea terminates outwards, there lies somewhere in Thina[174] a very great city, - not on the coast, but in the interior of the country, called Thina, - from which silk, whether in the raw state or spun into thread and woven into cloth, is brought by land to Barugaza through Baktria, or by the Ganges to Limurike. To penetrate into Thina is not an easy undertaking, and but few merchants come from it, and that rarely. Its situation is under the Lesser Bear, and it is said to be conterminous with the remotest end of Pontos, and that part of the Kaspian Sea which adjoins the Maiotic Lake, along with which it issues by one and the same mouth into the ocean.

66. All the regions beyond this are unexplored, being difficult of access by reason of the extreme rigour of the climate and the severe frosts, or perhaps because such is the will of the divine power.

India's Trade with the Roman World: A Loan Contract on Papyrus[175]

It is evident from the *Periplus* and other works that India played a pivotal role in international trade, especially with the Roman empire and South-east Asia. The discovery of a papyrus recording a loan contract by Roman merchants at the port of Muziris on the Malabar Coast provides valuable quantified data regarding the early maritime 'Indo-Roman' trade. We reproduce this brief extract in full:

RECTO, COLUMN 2

… of your other agents and managers. And

I will weigh and give to your cameleer another twenty talents for loading up for the road inland to Koptos, and

I will convey [sc. the goods] inland through the desert under guard and under security to the public warehouse for receiving revenues at Koptos, and

I will place [them] under your ownership and seal, or of your agents or whoever of them is present, until loading [them] abroad at the river, and

I will load [them] abroad at the required time on the river on a boat that is sound, and

I will convey [them] downstream to the warehouse that receives the duty of one-fourth at Alexandria and I will similarly place [them] under your ownership and seal or of your agents, assuming all expenditures for the future from now to the payment of one-fourth – the charges for the conveyance through the desert and the charges of the boatmen and for my part of the other expenses.

With regards to their being – if, on the occurrence of the date of repayment specified in the loan agreements at Muziris, I do not then rightfully pay off the aforementioned loan in my name – there then being to you or your agents or managers the choice and full power, at your discretion, to carry out an execution without due notification or summons.

You will possess and own the aforementioned security and pay the duty of one-fourth, and the remaining three-fourth you will transfer to where you wish and sell, re-hypothecate, cede to another party, as you wish,

And you will take measures for the items pledged as security in whatever way you wish, sell them for your own account at the then prevailing market price, and deduct and include in the reckoning whatever expenses occur on account of the aforementioned loan, with complete faith for such expenditures being extended to you and your agents or managers and there being no legal action against us [in this regard] in any way. With respect to [your] investment, any shortfall or overage [sc. as a result of the disposal of the security] is for my account, the debtor and mortgager….

VERSO, COLUMN 2

The abbreviation d.=drachman, m=Minas, and t.=talents (of weight when followed by m., of money when followed by d.)

1–3 Gangetic nard, 60 containers, whose value (sc. for the one-fourth customs duty payable at Alexandria), likewise, is being reckoned at 4500 silver drachmas per container… 45t

4–10 ivory, sound condition, weighing 78t. 54 3/4 m. whose value (sc. for the one-fourth customs duty), likewise, is being reckoned on a weight of …. 78t 43m. or, converted on the weight scale used by the one-fourth (customs

duty) of 95 lbs. to the talent, =7478 lbs., of which the amount subject to duty (of one-fourth of Alexandria), converting lbs. per talent, is a weigh of [7291 lbs.] in accordance with the customary reckoning for merchants, or… 76t. 45 m. at 100 d. per m. ….. 76t. 4500 d.

11–15 the remainder, representing the number in tusks removed by the Arabarchs, (which number is) over and above the number subject to duty (that will be available) for collection of the one-fourth (customs duty), which tusks are also subject to the collection of the one-fourth (customs duty…..) 11 ¾ m. at the same rate of 100 silver d. per m. 1175 d. for a total of ….. 76t. 5675 d.

16–21 lengths of fabrics, 54 weighing…. 13 t 9 ¾ m. of which, likewise, the value of the one-fourth (customs duty) is being reckoned on a weight of 12 t. 47m. which, as above, yields for the parcel on the weight scale used by the one-fourth (custom duty), (a weight of) 1214 lbs. but, in accordance, with the customary reckoning for merchants, a weight (for customs' purchase) of 12 t. 27 m. at 70 silver d. per m. …… 8t. 4290 d.

22–25 the remainder that was removed (sc. by the Arabarchs), which as above, represents as amount over and above (what will be available) for collection of the one-fourth (customs duty) (to the amount of) 22¾ m. at the same rate of 70 silver d. per m. 1592 d. 3 ob. total for the lengths of fabric 8 t. 5882 d. 3 ob.

26 total for the value of the ivory 76 t. 5675 d.

27–29 grand total for the 6 parcels of the cargo exported on the ship *Hermapollen* in silver 1154 t. 2852 d.[176]

.

CHAPTER — 8

AELIAN

Claudius Aelianus flourished in the mid-second century AD, settled in Rome and taught rhetoric in the reign of Emperor Hadrian. He admired Greek literature and oratory and spoke Greek like a native Athenian. He authored two books, of which "*On the Peculiarities of Animals*" gained recognition as a standard work on Zoology. It deals with a large number of birds and animals of India. He also wrote *A Collection of Miscellaneous History;* a considerable portion relating to India has been translated by McCrindle.[177]

On the prowess of Indian dogs – ability to fight lions:

Book IV. c. xix. Indian dogs must also be reckoned as wild beasts, being unmatched for prowess and courage, and being of the largest size to be anywhere found. They regard with contempt all other animals. But with the lion the Indian dog sets himself to fight; he sustains his onset, barks back when he roars, and bites him when he bites. The dog is in the end beaten, but not till he has sorely harassed his antagonist and mangled him. And yet it sometimes happens that the lion is vanquished by the Indian dog and killed in the chase. In point of fact, if the dog once clutches him he holds on like grim death. Even if one should approach and with a knife cut off the leg of the dog, the pain will not reduce him to let go his grip. Rather than let go he suffers the limb to be severed, and his jaws relax not till life is extinct. He then lies prostrate, forced only by death to abandon the fray.

Capturing and training elephants:

C. xxiv. The Indians cannot easily capture a full-grown elephant, for they will neither attempt this, nor are elephants of such an age permitted to be caught. But the hunters repair to the swamps adjoining a river, and there they catch the young ones. For the elephant loves grounds that are moist and soft, and enjoys being in the water, and prefers to spend his time in haunts of this nature, so that one may say he is a creature of the marsh. Now, as they are caught when of tender age and docile, the Indians bring

them up delicately, supplying them with the food they relish most, grooming them carefully and talking to them in soothing accents, for the elephants understand the native tongue. They rear them, in short, like children, bestowing on them great care and attention, and subjecting them to a long course of training.

Peacocks:

C. xxi. Describes the peacock, ending with this remark: 'Alexander, the Macedonian, on seeing these birds in India, was struck with astonishment, and so charmed with their beauty that he threatened the severest penalties against any one who should kill a peacock.'

The gentle elephant of Porus:

C. xxxvii. When Porus the Indian King was wounded in the battle in which he engaged with Alexander, the elephant on which he rode, though suffering itself from many wounds, did nevertheless with gentleness and caution draw out with its trunk the darts with which the body of Porus was pierced, and ceased not to do this until it observed that its master from the excessive loss of blood was becoming weak and ready to faint. Accordingly it lowered him slowly and gently, and stood still with its knees bent in such a way as would prevent the body of Porus in descending to be thrown with violence on the ground.

Bane of snakes and antidotes to snake bites:

Book XII. c. xxxii. The products of India are many and varied, and while some attest her happy and amazing fertility, others are such as to be neither envied nor commended nor desired… I intend to show how the country produces the bane of snakes. It breeds great numbers of them of different kinds, which it would be an endless task to specify. These snakes are harmful both to men and to the lower animals. But the same country produces plants which serve as antidotes to their bite, and of these the natives have so much knowledge and skill that they can apply the remedy suitable for the wound inflicted by any kind of snake. And they make all possible haste to assist each other when bitten, endeavouring to arrest the virulent and rapid spread of the poison through the body, as the country

supplies in ready abundance the means requisite for this purpose. But a snake, if it kills a man, cannot, as the Indians assert,…creep into its underground home, the earth refusing to receive it, and casting it out from her household, banishing it so to speak, from her bosom. So it goes about at large a wanderer and a vagrant, and drags on a miserable existence in the open air, summer and winter alike, while moreover its mate goes not near it, and its young ones disown their sire. Such a penalty for the killing of a man has been inflicted by Nature even on the irrational animals, by the providence of God, as I have related, and for him who hath understanding has the story been told.

Ganga and its creatures:

C. xli. The Ganges, which is an Indian river on springing from its sources, while as yet it has no tributary streams but only its own waters, has a depth of twenty fathoms, and a breadth of eighty stadia; but when in its progress other rivers have joined it and augmented its volume of waters, its depth reaches to sixty fathoms, and its breadth spreads out to four hundred stadia… It breeds fishes of monstrous size, and from the fat of these an unguent is prepared. Turtles also are found in it with a shell not smaller than a cask which can hold as much as twenty amphorae (about 180 gallons). It breeds also two kinds of crocodiles, and of these one is quite harmless, while the other devours all sorts of flesh and is unsparingly cruel. They have an excrescence on their snout like that of the horned serpent. The natives employ their services in inflicting the supreme penalty on malefactors, for they throw to them those who have been found guilty of the most heinous offences, and so they do not require the services of an executioner.

Splendour of Indian kings:

C. xviii. In the Indian royal palace[178] where the greatest of all the kings of the country resides, besides much else which is calculated to excite admiration,… there are other wonders besides, which I cannot undertake to describe in this treatise. In the parks tame peacocks are kept, and pheasants which have been domesticated; and among cultivated plants there are some to which the king’s servants attend with special care, for there are shady

groves and pasture-grounds planted with trees, and branches of trees which the art of the woodsman has deftly interwoven. And these very trees, from the unusual benignity of the climate, are ever in bloom, and, untouched by age, never shed their leaves; and while some are native to the soil, others are with circumspect care brought from other parts, and with their beauty enhance the charms of the landscape. The olive is not of the number, this being a tree which is neither indigenous to India, nor thrives when transported thither. Birds and other animals that wander at freedom and have never been tamed resort of themselves to India and there build their nests and form their lairs. Parrots are native of the country, and keep hovering about the king and wheeling round him, and vast though their number be, no Indian ever eats a parrot. The reason of all this is that they are believed to be sacred and that the Brachmans honour them highly above all other birds. They assign a specious enough reason for their doing so – namely, that the parrot alone, from the admirable conformation of its vocal organs, can imitate human speech. Within the palace grounds there are also artificial ponds of great beauty in which they keep fish of enormous size but quite tame. No one has permission to fish for these except the king's sons while yet in their boyhood. These youngsters amuse themselves without the least risk of being drowned while fishing in the unruffled sheet of water and learning how to sail their boats.

Trained elephants pay respects to the king; serve as trained guards:

C. xxii. An elephant trained for the purpose is the first to make an obeisance to the king of the Indians when he leaves the palace to administer justice, and never forgets this duty, or refuses to perform it. Close by the animal stands its keeper, who gives it a reminder of the lesson it has been taught by a stroke of the goad, and by accents of the native speech which elephants through a mysterious endowment of nature peculiar to themselves are capable of understanding. They are also stirred by the war-spirit as if showing that they keep this lesson in mind. Four-and-twenty elephants are constantly kept as guards of the king's person, and they relieve each other in turn just like other guards. They are trained likewise not to fall asleep when on guard, for they are tutored even to do this by the skill of the Indians.

Horses and elephants and gifts to the king:

C. xxv. Horses and elephants being animals of great use in arms and warfare are held in the highest esteem by the Indians. In their king's service they fetch bundles of hay, which they deposit in the stalls, and provender also, which they bring home fresh and green and undamaged. When the king finds their freight in this condition, he expresses his satisfaction, but if not, he punishes most severely the men in charge of the elephants and horses. Even very small animals are not beneath his regard, but he even accepts them when brought to him as presents; for the Indians do not look down with contempt at any animal whatever, whether it be tame or even wild. For instance, subjects that are of rank offer the king such presents as cranes and geese, hens and ducks, turtle-doves and attagen,[179] partridge and pindals,[180] and others that are smaller than the above-mentioned, such as bokalides and fly-catchers, and what are called kestrels. They show these below the feathers to prove the extent of their fatness. They give also animals which they have caught, stags and antelopes, and gazelles and oryxes and unicorn asses (of which I have made previous mention), and also different kinds of fish, for they bring even these as presents.

Indian sugarcane held the Greeks in thrall:

Book XV. c. vii. In India, and more especially in the country of the Prasians,[181] liquid honey falls like rain upon the herbage and the leaves of marsh-reeds, and supplies sheep and oxen with an admirable kind of nutriment, the exceeding sweetness of which the animals highly relish. Now the herdsmen drive them to those spots where this delicious dew falls and lies, and the cattle in return supply the herdsmen with a delicious repast, for they yield a very sweet milk which does not require honey to be mixed with it as is done in Greece.

Pearl fishing:

C. viii. The Indian pearl-oyster… is caught in the following manner. There is a city which a man of royal extraction called Soras[182] governed at the time when Eukratides governed the Baktrians,[183] and the name of that city

is Perimuda. It is inhabited by a race of fish-eaters who are said to go off with nets and catch the kind of oysters mentioned, in a great bay by which a vast extent of the coast is indented. It is said that the pearl grows upon a shell like that of a large mussel, and that the oysters swim in great shoals, and have leaders, just as bees in their hives have their queen-bees. I learn further that the leader is bigger and more beautifully coloured than the others, and that in consequence the divers have a keen struggle in the depths which of them shall catch him, since when he is taken they catch also the entire shoal, now left, so to speak, forlorn and leaderless, so that it stirs not, and, like a flock of sheep that has lost its shepherd, no longer moves forward against any incipient danger. As long, however, as the leader escapes and skilfully evades capture, he guides their movements and upholds discipline. Such as are caught are put into tubs to decay, and when the flesh has rotted and run off nothing is left but the round pebble. The best sort of pearl is the Indian and that of the Red Sea.

Wild animals gifted to kings:

C. xiv. The Indian bring to their king tigers made tame, domesticated panthers, and oryxes with four horns. Of oxen there are two kinds – one fleet of foot, and the other extremely wild, and from [the tails of] these oxen (the yak) they make fly-flaps. The hair on their body is entirely black, but that of the tail is of the purest white. They bring also pigeons of a pale yellow plumage which they aver cannot be tamed or even cured of their ferocity; and birds which they are pleased to call *kerkoronoi*,[184] as well as dogs of that noble breed of which we have already spoken; and apes, some of which are white, and others again black. Those apes that are red-coloured they do not bring into towns, as they have a mania for women, and, if they assault them, are put to death from the abhorrence roused by such a lascivious outrage.

Worship of snakes encountered by Alexander:

C. xxi. When Alexander was assaulting some of the cities in India and capturing others, he found in many of them, besides other animals, a snake, which the Indians, regarding as sacred, kept in a cave and worshipped with much devotion. The Indians accordingly with every kind of entreaty

implored Alexander to let no one molest the animal, and he consented to this. Now when the army was marching past the cave, the snake heard the sound that arose (being very sharp both of hearing and sight), and hissed so loud and emitted such gusts of rage that every one was terrified and quite confounded. It was said to be seventy cubits long, and yet the whole of it was not seen, but only its head that projected from the cave. Its eyes, moreover, are reported to have equalled the size of the large, round Macedonian shield.

Oxen races:

C. xxiv. The Indians make much ado also about the oxen that run fast; and both the king himself and many of the greatest nobles take contending views of their swiftness, and make bets in gold and silver, and think it no disgrace to stake their money on these animals. They yoke them in chariots, and incur hazard on the chance of victory. The horses that are yoked to the car run in the middle with an ox on each side, and one of these wheels sharp round the turning-post and must run thirty stadia. The oxen run at pace equal to that of the horses, and you could not decide which was the fleeter, the ox or the horse. And if the king has laid a wager on his own oxen with any one, he becomes so excited over the contest that he follows in his chariot to instigate the driver to speed faster. The driver again pricks the horses with the goad till the blood streams, but he keeps his hand off the oxen, for they run without needing the goad. And to such a pitch does the emulation in the match between the oxen rise, that not only do the rich and the owners of the oxen lay heavy bets upon them, but even the spectators, just as Idomeneus the Cretan and the Locrian Ajax are represented in Homer betting against each other. There are in India oxen of another kind, and these look like very big goats. These are yoked together, and run very fast, being not inferior in speed to the horses of the Getae.

Myriad birds:

Book XVI.c.ii. They are also peacocks in India, the largest of their kind anywhere found, and wood-pigeons with pale-green feathers, which one ignorant of ornithology on seeing for the first time would take to be parrots and not pigeons. They have bills and legs of the same colour as Greek

partridges. There are in India cocks also of the largest size, with crests not red-coloured like those of our cocks at least, but many-hued like a coronal of flowers. Their rump feathers are neither curved nor curled, but broad, and they trail them as peacocks do their tails when they do not lift and erect them. The plumage of these Indian cocks (monal pheasants) is of a golden and a gleaming azure colour like the smaragdus stone.

Taming the panther (not lion) for hunting:

C. xxvi. I have no reason whatever to doubt that lions of the largest size are found in India, and what convinces me is that this country is such an excellent mother of other animals. But of all the beasts that one can encounter these are the most savage and ferocious. The skins of these lions look black – the bristly hair of their mane stands erect, and their very aspect strikes the soul with terror and dismay. If they can be captured before they are full-grown and not otherwise, they can be led by the leash, and with the huntsmen and their hounds take part in hunting young deer and stags, and boars and buffaloes and wild asses, for, as I am told, they have a very keen scent.[185]

Care of royal elephants:

XII. 8. The elephant when feeding at large ordinarily drinks water, but when undergoing the fatigues of war is allowed wine,—not that sort, however, which comes from the grape, but another which is prepared from rice. The attendants even go in advance of their elephants and gather them flowers; for they are very fond of sweet perfumes, and they are accordingly taken out to the meadows, there to be trained under the influence of the sweetest fragrance. The animal selects the flowers according to their smell, and throws them as they are gathered into a basket which is held out by the trainer. This being filled, and harvest-work, so to speak, completed, he then bathes, and enjoys his bath with all the zest of a consummate voluptuary. On returning from bathing he is impatient to have his flowers, and if there is delay in bringing them he begins roaring, and will not taste a morsel of food till all the flowers he gathered are placed before him. This done, he takes the flowers out of the basket with his trunk and scatters them over the edge of his manger, and makes by this device their fine scent be, as it were, a

relish to his food. He strews also a good quantity of them as litter over his stall, for he loves to have his sleep made sweet and pleasant. The Indian elephants were nine cubits in height and five in breadth. The largest elephants in all the land were those called the Praisian, and next to these the Taxilan.

Taming elephants with music:

XI. 44. In India an elephant if caught when full-grown is difficult to tame, and longing for freedom thirsts for blood. Should it be bound in chains, this exasperates it still more, and it will not submit to a master. The Indians, however, coax it with food, and seek to pacify it with various things for which it has a liking, their aim being to fill its stomach and to soothe its temper. But it is still angry with them, and takes no notice of them. To what device do they then resort? They sing to it their native melodies, and soothe it with the music of an instrument in common use which has four strings and is called a skindapsos. The creature now pricks up its ears, yields to the soothing strain, and its anger subsides. Then, though there is an occasional outburst of its suppressed passion, it gradually turns its eye to its food. It is then freed from its bonds, but does not seek to escape, being enthralled with the music. It even takes food eagerly, and, like a luxurious guest riveted to the festive board, has no wish to go, from its love of the music.

Character of Indians:

L. 4. The Indians neither put out money at usury, nor know how to borrow. It is contrary to established usage for an Indian either to do or suffer a wrong, and therefore they neither make contracts nor require securities.

FRAGMENTS

FRAG. IV. AELIAN, *DE NAT. ANIM.*, BOOK XVII, 29

When the King of the Indians goes on a campaign, one hundred thousand war-elephants go on before him, while three thousand more, that are of superior size and strength, march, I am told, behind him, these being trained

to demolish the walls of the enemy. This they effect by rushing against them at the King's signal, and throwing them down by the overwhelming force with which they press their breasts against them. Ktesias reports this from hearsay, but adds that with his own eyes he had seen elephants tear up palm trees, roots and all, with like furious violence; and this they do whenever they are instigated to the act by their drivers.

FRAG. XXIII. AELIAN, IV, 46

Among the Indians are found certain insects about the size of beetles and of a colour so red that at first sight one might mistake them for cinnabar. Their legs are of extraordinary length and soft to the touch. They grow upon the trees which produce amber, and subsist upon their fruit. The Indians collect them for the sake of the purple dye, which they yield when crushed. This dye is used for tinting with purple not only their outer and their under-garments, but also any other substance where a purple hue is required. Robes tinted with this purple are sent to the Persian king, for the Indian purple is thought by the Persians to be marvellously beautiful and far superior to their own. This we learn from Ktesias, who says well, for this dye is in fact deeper and more brilliant than the renowned Lydian purple.

.

CHAPTER — 9

Philostratus : Life of Apollonius

Apollonius, a Greek mystic reputed as "the wise man of Tyana," was maligned in the early centuries AD as an anti-Christ. There are no authentic contemporary records about his career, though he is credited with performing miracles later attributed to Christ, such as raising the dead, healing the sick, and rising bodily to heaven. His asceticism and disapproval of animal sacrifice suggest he followed Pythagoras; his philosophical quest for truth and the welfare of the people set him against famous tyrants. He was accused of atrocities ranging from sexual license (though he was celibate), corruption (though he renounced his family fortune), dining on the flesh of infants (a charge dropped when he appeared before the emperor).

Our knowledge of this sage derives from the account written by Philostratus around 220 AD, at the behest of Empress Julia Domna, wife of Septimius Severus (ruled 193 – 211 AD). Apollonius was born in the early Christian era and died at an advanced age during the brief reign of Emperor Nerva (96 – 98 AD). Emperor Hadrian had a collection of some of his letters; Philostratus accessed some letters from a collection then extant. Some letters were ancient forgeries and hence need careful evaluation. A few of Apollonius' writings have survived, notably a treatise on sacrifice and a biography of Pythagoras, but most of Philostratus' sources no longer survive.

Lucian, satirist and essayist of second century Hellenism, was the only writer to mention Apollonius before Philostratus; he was a critic. One Moeragenes reportedly wrote four books on the sage, which have not survived, but Christian writer Origen suggests these were derogatory, inspired by philosopher Euphrates, who detested Apollonius. Philostratus lists one credible source about Apollonius' doings in the Cilician city of Aegae, Maximus of Aegae, in-charge of the Roman emperor's Greek correspondence (*ab epistulis graecis*). But the authenticity of Damis, the source Philostratus most relies upon, is challenged by modern scholars.

In 215, Julia Domna accompanied her son, Emperor Caracalla, through Cappadocia, where he halted at Tyana to honour the memory of Apollonius,

and commissioned a temple in his honour, an event recorded by the historian Cassius Dio. The latter also mentioned Apollonius' vision of the murder of Emperor Domitian in Rome while it was actually happening, though he was then at Ephesus. Apollonius was eulogised as superior to Christ during the Diocletianic persecution of Christians. Hierocles, governor of Bithynia, penned *The Lover of Truth,* using Philostratus' biography to establish that Apollonius of Tyana was Christ's equal. We know of this work from the response of Eusebius of Caesarea.

The root cause of conflict between the Romans and Christians was the power to perform miracles. Hierocles accused Christians of calling their Saviour a god on the basis of sundry miracles, when Apollonius had greater achievements to his credit. By the end of the fourth century, Apollonius emerged as a key figure in the conflict between Christians and non-Christians. St Augustine insisted the sage could not be ranked above Jesus Christ, but placed him above Zeus. Byzantine Christianity finally included him in the figurative decoration of churches, from where he passed into Arab mythology as Balinas, master of talismans.

Philostratus hailed from a prominent literary family of the island of Lemnos, bearing the Roman family name of Flavius. In *Lives of the Sophists*, he recorded the Greek literary renaissance under Roman rule, including biographies of important sophists and orators of the second and early third centuries. Scholars suggest caution in assessing *Life of Apollonius*. Possibly Vespasian, Apollonius, Dio Chrysostom and Euphrates did meet in Egypt and discuss the nature of the ideal ruler, a favourite subject of philosophers; but there is no independent evidence for the existence of Damis and his memoirs.

Charles Blunt translated Philostratus' *Life of Apollonius* in 1680, but could not publish the whole text due to an uproar that it threatened Christianity. In 1809 Rev. Edward Berwick published the first complete translation and revived the old dispute. Historian Edward Gibbon remarked: 'Apollonius of Tyana was born about the same time as Jesus Christ. His life (i.e., Apollonius') is related in so fabulous a manner by his fanatic disciples, that we are at a loss to discover whether he was a sage, or an imposter.' In 1832, German theologian Ferdinand Christian Baur said Philostratus' biography of Apollonius was anti-Christian propaganda. Philostratus received serious attention only in the early twentieth century, with the Loeb

translation by F.C. Conybeare and the Oxford translation by J.S. Phillimore, both in 1912. The present selections, confined to Apollonius' travels to India and his interest in Indian philosophy, are based on the translation by C.P. Jones (Penguin, 1970).

BOOK I

On Apollonius as a great philosopher:

2. The practices of Apollonius were very like this, and he studied wisdom in a more inspired way than Pythagoras; he also despised tyrannies. Yet, although he lived in times which were neither ancient nor modern, people do not know him for the genuine wisdom which he practiced as a philosopher and an honourable man…

I have therefore decided to do something about this widespread misconception and give an accurate account of Apollonius, observing the chronology of his words and acts and the special character of the wisdom that brought him close to being thought possessed and inspired. I have gathered my materials partly from the many cities that were devoted to him, partly from the shrines which he set right when their rules had fallen into neglect, partly from what others have said about him and partly from his own letters. For he corresponded with kings, sophists, philosophers, Eleans, Delphians, Indians, Egyptians. He wrote about the gods, about customs, morals and laws; and when wrong was done, he tried to put it right.

3. But my more detailed information I have gathered from a quite cultivated man called Damis who once lived in ancient Nineveh. This man became a disciple of Apollonius and has left an account of his master's journeys, on which he claims to have accompanied him, and also an account of his sayings, speeches and predictions. The notebooks containing the memoirs of Damis were unknown until a member of his family brought them to the attention of the empress Julia. Since I (Philostratus) was a member of her salon (for she admired and encouraged every branch of rhetoric), she set me to transcribe these discourses of Damis. I was to pay particular attention to their style, for the man from Nineveh had a clear one, but rather artless. I have also read the book of Maximus of Aegae, which contains all that Apollonius did there, and the will written by Apollonius

himself, which gives an idea of how inspired he was in his philosophy. But it is best to ignore the four books which Moeragenes composed about Apollonius, because of the great ignorance of their subject that they display. So much for the way I gathered my material from different sources and the care I took to assemble it.

4. Apollonius came from Tyana, a Greek city in the country of Cappadocia. His father had the same name as himself, and the family was an old one that went back to the founders of the city. Its wealth was exceptional there, even though it is a rich country. When his mother was still carrying him, she had a vision of an Egyptian spirit, Proteus, whom Homer describes changing into different shapes. She was not frightened at all, but asked him who her child would be. He replied: 'Me.' 'Who are you?' she asked, and he said, 'Proteus, the Egyptian god.' …

Apollonius attracted to the philosophy of Pythagoras:

7. …When he reached fourteen his father took him to Tarsus to learn from Euthydemus of Phoenicia. This man was a good rhetor as well as Apollonius's teacher, and Apollonius became devoted to him, though finding Tarsus corrupt in its ways and inimical to philosophy... So with his father's permission he found a new teacher in Aegae nearby, where there was peace that encouraged a love of wisdom, and interests more suitable for young men… There he had, as fellow-pupils, followers of Plato, Chrysippus and the Colonnade,[186] and he also heard the doctrines of Epicurus, not thinking even these unworthy of his attention: but those of Pythagoras he grasped by some mysterious intelligence… When he reached fifteen he aspired to the life of a Pythagorean, to which some higher power gave him wings to climb.

[He] persuaded his father to give him a suburban estate with pleasant gardens and fountains in it. 'You live your own way,' he said, 'and I will live Pythagoras's way.' …He avoided the meat of animals as something impure that dulled the intelligence, and ate fruit and vegetables, saying that everything was pure which the earth produced of its own accord. Wine, he said, was a pure drink, since it came from a plant that had done such good to men, but it disturbed the balance of the mind by darkening the ether in the soul. After purging his stomach in this way he took to going barefoot

(that was ‘dressing’ to him) and wore clothes of linen, refusing those that were made from animals. He also grew his hair long, and lived in the sanctuary (temple).

Apollonius decides to be celibate for life:

13. … Now though Pythagoras was praised for his statement that a man should not have intercourse with any woman except his wife, Apollonius said that the commandment of Pythagoras applied to others, but he himself was not going to marry or have any sex at all…

Apollonius practices silence for five years:

14. Euxenus once asked Apollonius why he did not become a writer since his thoughts were so noble and his diction admirably forceful. ‘Because I have not yet kept silence,’ he answered. From then on he considered himself bound to silence, and held his tongue while his eyes and mind read and stored away many things in his memory… He says that this way of life, which he practiced for five whole years, was extremely difficult, because he could not speak when he had much to say, was forced not to listen when he heard much to make him angry, and often when he was inclined to correct somebody he used to say to himself, “Be still, my soul, and tongue too,” and when people’s conversation offended him he had to put off refuting them for the time being.

Apollonius decides to visit India:

18. After this he pondered making a greater journey, and decided on the country of India and the wise men there called Brahmans and Hyrcanians…

19. And so he arrived in ancient Nineveh, where there is an idol of barbarian type in the shape of Ino the daughter of Inachus, with little horns projecting from her temples and just breaking through. As Apollonius was staying there and showing more knowledge about the idol than the priests and the prophets, Damis of Nineveh came to hear him...[and] said, ‘Let us go, Apollonius, you following God and I following you, for you might find me very useful. I may not know anything else, but I have been to Babylon; and, having made the journey recently, I know all the cities on the way and the villages, in which there are many attractions, and moreover I know

every one of the barbarian languages. The Armenians have one, the Medes and Persians another, the Cadusians another, and I understand them all.' 'But I, my friend,' replied Apollonius, 'know them all, and have learned none'. The man from Nineveh was amazed, but Apollonius said, 'Do not be surprised if I know all that men say: I know all that men conceal too.'

20. …I will not neglect these two points: the courage that Apollonius showed in travelling among barbarian tribes given to robbery and not yet subject to Rome, and the wisdom that enabled him even to attain understanding of the voices of animals, in the Arabian way. He even learnt this as he was travelling among those Arabs, who of all their nation are the most knowledgeable and skilful in this science. For it is common to all Arabs to listen to the prophecies of birds instead of oracles, and they understand dumb animals by eating the hearts of snakes, or (as some say) the livers.

BOOK II

On Apollonius' stay in India:

19. …they were apparently told by the Indians that the king visited the river in the right season and sacrificed to it black bulls and horses – black being more highly regarded by the Indians than white, I suppose, because of their own colour. After this sacrifice he would throw into the river a golden measure, which resembled those used for measuring grain. The Indians had no notion why the king did this; but the party inferred that this measure was thrown in to ensure either plentiful harvest, which farmers 'measure' out, or else a 'measured' flow, so that the river should not come down in spate and swamp the land.

Apollonius arrives in Taxila:

20. Taxila is apparently similar to Nineveh in size, symmetrically fortified like a Greek city, and is the capital of the king who ruled Porus' domain at the time.[187] They say they saw a temple in front of the walls a little less than a hundred feet in length and made of stone covered with stucco.[188] Inside it there was a shrine comparatively small for such a large, many-

columned temple, but worth admiring. On every wall there are fixed bronze panels illustrating the deeds of Alexander and Porus. On them, in orichalc, silver, gold and bronze, there are drawn elephants, horses, soldiers, helmets and shields, with spears, javelins and swords all in iron. A famous picture, for example one by Zeuxis, Polygnotus or Euphranor, is praised because the artists liked effects of shadow, vividness, and contrasts of emphasis; and the same effects are apparently to be observed in these pictures where the materials are blended like colours. The purpose of the pictures also pleased them. Porus had dedicated them after the death of the Macedonian, but even so the Macedonian is shown as the victor, winning the wounded Porus over and giving him India after he had conquered it. Porus is also said to have mourned Alexander at his death and grieved for him as a good and noble king; and while Alexander lived he is said never to have spoken as a king, though Alexander allowed him, or to have given orders to Indians; but like a viceroy he was entirely moderate and did everything to please his friend.

On the King Porus:

21. My account forbids me to omit the records of this Porus. When the Macedonian was about to cross, some were advising Porus to make allies of those across the Hyphasis and the Ganges, saying that Alexander would not dare to confront an entirely united India. Porus replied: ‘If my kingdom is such that it cannot be saved without allies, it would be better not to be king.’ When the news came that Darius had been captured, he called him ‘the Great King, but no man’. When the groom had prepared the elephant on which he was to fight, and said to him, ‘This will carry you, king’, he replied, ‘No, I will carry it, if I prove a man worthy of myself’. Advice was given to him to sacrifice to the river and pray that it should not bear the rafts of the Macedonians or allow Alexander to sail, but he said, ‘It is not for men in arms to curse.’ And after the battle, when he had shown Alexander how godlike he was and of more than mortal nature, one of his relatives said to him, ‘Porus, if you had done obeisance when Alexander crossed, you would not have suffered defeat in battle, or lost so many Indians, or received a wound yourself.’ He replied: ‘I had heard of Alexander’s nobility, and I foresaw that, if I made obeisance, he would think me a slave, but if war, a king. I preferred to be admired rather than

pitied, and I was not disappointed. I proved myself the man Alexander saw me to be, and so in one day I lost and gained everything.' This is the character the Indian is reputed to have had. He is also said to have been outstanding among Indians for his handsomeness and height, which was greater than that of any man since those at Troy; and he was very young when he fought Alexander.

King of Taxila sends for Apollonius; sees double-storey houses in India:

23. As Apollonius was giving this discourse, messengers arrived from the king with an interpreter, announcing that he would have Apollonius as his guest for three days, since it was not lawful for strangers to stay in the city longer; and they led the way to the palace. I have mentioned what the walls of the city were like; the party says that it was a tangle of narrow streets, like Athens, and the houses were so built that from the outside they appeared to be of only one storey, but when you went inside they proved to be subterranean, with the same plan below ground as above.

A shrine to the Sun God:

24. They say there was also a shrine of the Sun, with Ajax the elephant pasturing in it, and statues of Alexander in gold and others of Porus which were of dark bronze.[189] The walls of the shrine were of red stone that had a golden sheen, giving off a light like the sun's rays. The image itself was of mother-of pearl, made in the symbolic shape that all barbarians use for their holy objects.

The royal palace at Taxila:

25. In the palace they apparently saw no elaborate rooms, no bodyguard or watchmen, but just as in the houses of the upper class there were a few slaves and three or four people awaiting an audience with the king. They say they admired this simplicity more than the splendour of Babylon, and even more so when they went inside, since it seems that the men's quarters and the colonnades and the whole forecourt were plain.[190]

Apollonius discourses on philosophy with the king:

26. Apollonius concluded that the Indian was a philosopher and, with the interpreter beside him, he said, ‘I am glad, king, to see that you are a philosopher.’

‘I am very glad,’ he replied, ‘that you think me so.’

‘Is this the custom with you,’ said Apollonius, ‘or did you introduce this moderation into your kingdom?’

‘Our customs are modest, and I observe them even more modestly,’ he replied, ‘I have more than any man, but need little, for all my friends’ possessions I consider mine.’

‘Your wealth is enviable,’ said Apollonius, ‘if you value your gold and silver less than your friends, from whom you derive many advantages.’

‘Why,’ he said, ‘I give my enemies a share of my riches too. There are always barbarians hostile to my country, who make incursions across my borders, so I win them over with this money and they guard my country. They both avoid raiding my possessions and keep out their barbarian neighbours, who are unmanageable.’

Apollonius asked him if Porus too had paid them money. ‘Porus,’ he said, ‘loved war: I love peace.’

Apollonius was quite won over by these remarks, and was so struck by him that once, when he was rebuking Euphrates for not acting like a Philosopher, he said, ‘But let us at least respect the Indian Phraotes’ (since that was his name). …

Apollonius also asked him (the king) about his diet and he said, ‘Of wine I drink as much as I sacrifice to the Sun. What I catch in the hunt others eat: the exercise is enough for me. My food is vegetables, the centre of date-palms and their fruit[191] and everything that grows beside the river. I also eat many things that grow on trees: they are harvested by these hands of mine.’ Apollonius was delighted when he heard this, and kept glancing at Damis.

The victory gates of Alexander:

42. When they had left Taxila and gone two days’ journey, they came to the plain in which Alexander is said to have fought Porus, and apparently they saw gates there which did not enclose anything but were built as a trophy. On top of them there was dedicated a statue of Alexander riding an eight-horse chariot, the way he stood when he conquered the viceroys of

Darius at Issus. In fact there are said to be two sets of gates, not far from one another, one being Porus and the other Alexander, represented as they met after the battle, I suppose, since one of them appears in a gesture of greeting, and the other in a gesture of submission.

43. When they had passed the Hydraotes and passed several tribes, they came to the Hyphasis. About four miles past this they found altars with this inscription:

'To my father Ammon, my brother Hercules, Athene of Forethought, Olympian Zeus, the Cabiri of Samothrace, the Sun of India, and Apollo of Delphi.'

They say there was also a bronze tablet dedicated there with the legend, 'Alexander stopped here.' We must conclude that the altars were set up by Alexander to commemorate the limits of his empire, while I suppose the tablet was dedicated by the Indians across the Hyphasis to celebrate the fact that Alexander advanced no further.

BOOK III

Apollonius arrives to discourse with the Wise Men of India:

11. They were about to put up in the nearby village, which is less than a few hundred yards from the Wise Men's hill, when they saw, it appears, a young man running towards them. He was a particularly dark Indian, but with a bright crescent-shaped mark on his forehead.

Apollonius is received by Greek-speaking Indians:

12. He ran up to Apollonius and greeted him in Greek, which was not in itself surprising since everybody in the village talked Greek. But his saying 'Hello' to each of them by name amazed all of them except Apollonius; he felt assured of his mission, because he looked at Damis and said, 'We really have come to wise men, since they seem to have foreknowledge.' Immediately he asked the Indian what he had to do, being eager to meet them. The Indian said, 'These men you must leave here, but you must yourself come immediately because the Masters invite you.'

13. The word 'Masters' in itself seemed Pythagorean to Apollonius, and he followed gladly.

On the Indian Brahmins:

15. The Wise Men's nature and their way of life on the hill are described by Apollonius himself, since in one of his addresses to the Egyptians he says, 'I saw the Indian Brahmans living on the earth and not on it. Walled without walls, and with no possessions except the whole world's.' This is his rather philosophical account: Damis says that they sleep on the earth, but the earth makes a bed for them of any kind of grass they choose. He also says he saw them levitating as much as three feet from the ground, not for ostentation, since that kind of vanity is foreign to them, but because all the rites they perform to the Sun they do above the earth like him, considering this practice appropriate for the god. The fire which they draw from the sun's ray is of normal appearance, but they do not light it on an altar or keep it in a lantern; instead it is like the rays which come from the sun and are reflected by water, and apparently it is seen above the ground flickering in mid-air. They pray to the Sun on behalf of the seasons of which it is the guardian, so that they may come at the right time for the land and India may prosper; by night they pray to the sunbeam, asking it not to be at enmity with the night but remain in the form it was created by them. That is the meaning of Apollonius' saying, 'The Brahmans are on the earth and not on the earth.' But 'walled without walls' refers to the climate in which they live, since although they appear to camp in the open air, they bring shade to cover themselves, they are not wetted when it rains, and have sunshine whenever they want.

Apollonius' saying, 'with no possessions except the whole world's' is interpreted by Damis in this way. Just as springs of water break from the earth for the worshippers of Bacchus when the god makes them and the earth quake, so they appear for the benefit of those Indians when the Indians are giving or being given a dinner. It was therefore an appropriate description of people who make no preparations in advance but obtain everything they want on the spot, when Apollonius said that they 'possess what they do not possess.'

They wear their hair long as the Spartans once did and the Thurians of Tarentum and the Melians and all the peoples that are recorded as having Spartan ways, and they tie it with a white ribbon; their feet are bare, and their style of clothing is similar to a cloak over one shoulder. The material

for their clothing is wool that grows wild from the earth, white like Pamphylian wool but softer, and it exudes fat like oil. They consider this the stuff of holy garments, and if anybody except these Indians tries to pick this wool, it stays fast in the earth. The ring and the rod, both of which they carry, have a power which is capable of anything, and both are magical and highly regarded.

The meeting with Iarchas and the Wise Men:

16. As Apollonius approached, the other Wise Men went up to him and greeted him with embraces, but Iarchas remained seated on a high chair; it was of dark copper ornamented with golden figures, while the chairs of the others were of undecorated copper and less high, since they sat at Iarchas's feet. On seeing Apollonius, Iarchas greeted him in Greek and asked for the Indian's letter. When Apollonius showed amazement at his clairvoyance, Iarchas added that there was one letter missing in the document, a D that the writer had left out. This proved to be true; and when he had read the letter, he said, 'Apollonius, what is your opinion of us?

'Why,' said Apollonius, 'it is shown by my taking a journey because of you which no one of the people I come from has ever taken.'

'What knowledge do you think we have that you lack?

'It is my opinion that your ways are wiser and much more godly. But if I were to find among you nothing that I do not know, I would also have learned that there is nothing further for me to learn.'

So the Indian replied, 'Other people ask newcomers where they come from and what their mission is, but for us it is the first proof of our wisdom that we are not ignorant about our visitors. You may begin by testing this.' Whereupon he recounted Apollonius' ancestry on his father's and his mother's side, all his experiences in Aegae, how Damis joined him, all the things that they had discussed on the journey or had learned from the discussions of others. All this the Indian recited clearly and without pausing just as if he had shared the journey with them. Apollonius was amazed and asked him how he knew all this, and he replied, 'You, our visitor, have a share of this wisdom, but not yet all of it.'

'Will you let me learn it all, then?' Apollonius asked.

‘Willingly,’ Iarchas replied; ‘that is more philosophical than grudging and concealing what is important. Besides, Apollonius, I see that you are well endowed with memory, which is the god we honour most.’

‘What?’ said Apollonius, ‘Have you already discerned my nature?’

‘Apollonius,’ he replied, ‘we discern every kind of soul, and have countless clues to discover them. But it is nearly noon, and we must prepare the gods’ due rites; so we must attend to them, and later let us discuss whatever you like, and I invite you to attend all our ceremonies.’

‘Well,’ said Apollonius, ‘I would certainly be doing a wrong to the Caucasus and the Indus, which I passed coming here to see you, if I did not steep myself in all your rites.’

The sacred rites:

17. ‘Steep yourself,’ Iarchas said, ‘and let us go.’ So they went to a spring of water, which Damis says he saw later and was reminded of Dirce in Boeotia. First they undressed, then they anointed their heads with an ointment like amber, which had such a warming effect on the Indians that their bodies steamed and they ran with sweat as if washing themselves with fire. Then, after diving into the water and washing, they proceeded to the temple garlanded and full of song. There they stood around in a circle and with Iarchas as their leader struck the ground with the ends of their staves; and the ground, flexing like a wave, shot them three feet into the air. They then sang a song like the Paean by Sophocles which they sing to Asclepius at Athens.

On knowledge and self-knowledge:

18. When Apollonius had sat down, Iarchas said, ‘Ask me whatever you like, since you have come among men who know everything.’ So Apollonius asked if they knew themselves, expecting them to be like the Greeks in thinking it difficult to know oneself. But to Apollonius’ surprise Iarchas corrected him and said, ‘We know everything because we begin by knowing ourselves. None of us would approach our kind of philosophy without knowing himself first.’ Apollonius remembered what he had heard from Phraotes, how the man who intends to be a philosopher tests himself before making the attempt: so he accepted this statement, having the same

belief about himself. He proceeded to ask what they thought they were, and Iarchas replied, ‘Gods.’

‘Why?’ asked Apollonius.

‘Because we are good men.’

Apollonius thought that this saying showed such enlightenment that later he used it before Domitian in his speech of self-defence.

The transmigration of souls:

19. So he resumed the questioning, and said, ‘What is your belief about the soul?’

‘It is what Pythagoras taught you Greeks,’ said Iarchas, ‘and we taught the Egyptians.

Apollonius replied, ‘Would you say, then, that you were some Trojan or Achaean or someone before you entered this body, as Pythagoras declared himself to be Euphorbus?

‘Troy was destroyed,’ said the Indian, ‘by the Achaeans that sailed there then, and you Greeks have been destroyed by the tales about it. You think the only heroes are those that attacked Troy, and so you neglect a larger number of more godlike men produced by your own country, by Egypt, and by India. But since you asked me about my former body, tell me whom you think most outstanding of those that attacked or defended Troy’.

‘Achilles the son of Peleus and Thetis, since Homer sings of him as a very handsome man and greater than all the other Greeks, and mentions great deeds of his. He also has a high opinion of men like Ajax and Nireus, whom he mentions as second to Achilles in beauty and nobility.’

‘Compare my ancestor,’ Iarchas replied, ‘with Achilles, Apollonius, or rather my ancestral body, since that is what Pythagoras considered Euphorbus.

Legend of the expulsion of Ethiopians from India and reincarnation:

20. You see, there was a time when the Ethiopians lived here and were an Indian tribe. As yet Ethiopia did not exist, but Egypt had its boundary at Maroe and the Cataracts, and the same country contained the source of the Nile and ended at its mouth. As long as the Ethiopians lived here as subjects of King Ganges, the earth fed them plentifully and the gods protected them.

But they killed their king, and were considered unclean by the other Indians. The earth, too, no longer let them stay; it destroyed the seed that they put in it before it came to the sheath, it aborted women's conception, and gave poor fodder to the cattle, and wherever they founded a city, the earth caved in and gave way beneath. Moreover, the ghost of Ganges drove them on as they progressed, causing terror among the mob, and gave them no peace until they had sacrificed to the earth the murderers and those that had stained their hands with blood. This Ganges was fifteen feet tall, beautiful as no other man ever was, and was the son of the river Ganges. His father had flooded India, but he diverted it into the Red Sea[192] and reconciled it with the land: for this reason the earth produced plenty for him while he lived, and took vengeance when he died. Now Homer makes Achilles come to Troy for Helen, and says that he had captured twelve cities by sea and eleven by land, and that he flew into a fury when the king took a woman away from him, showing himself harsh and savage. Let us compare the Indian with this. He founded sixty cities, the most esteemed in the country; and there is nobody who thinks sacking cities is more glorious than building them. He also repulsed the Scythians from above the Caucasus when they made an attack once on this land; and to prove your courage defending the liberty of your own land is far better than bringing slavery on a city, especially when it is because of a woman who probably did not mind being carried off. He made an alliance with the ruler of the land that Phraotes now rules; and when the man, in sheer lawlessness and lust, took away his wife, he did not break his treaty, saying he had sworn so solemnly that he could not harm him even when wronged.

21. 'I could tell you more about him, except that I am reluctant to start praising myself, since you see, I am that man. I proved this when I was four. This Ganges once drove seven swords of adamant into the earth so that no danger could come near this land, and the gods ordered us to go where the swords were planted and sacrifice, but they did not reveal the place where they were. Still just a child, I led the prophets to a ditch and told them to dig, saying that the swords were deposited there.

Cures for the sick:

38. In the middle of this conversation, the Wise Men were interrupted by the messenger bringing some Indians who needed cures.

39. Besides that, there came a man of about thirty, who was lame; he had been an expert lion-hunter but had been attacked by a lion and had dislocated his hip, and so was lame in one leg. But the Wise Man massaged his hip and thus restored the man to an upright walk. Someone else who had gone blind went away with his sight fully restored, and another man with a paralysed arm left strong again. A woman, too, who had had seven miscarriages was cured through the prayers of her husband as follows. The Wise Man told the husband, when his wife was in labour, to bring a live hare under his cloak to the place where she was, walk around her, and immediately release the hare: for she would lose her womb as well as the foetus if the hare was not immediately driven out.

Apollonius takes leave of the Brahmins:

50. So much for the conversations between Apollonius and the Wise Men. He had stayed there for four months and absorbed all their doctrines, both avowed and secret. When he decided to leave, they persuaded him to send the guide and the camels to Phraotes with a letter, while they themselves gave him another guide and camels, and sent him on his way, congratulating themselves as well as him. They embraced Apollonius, saying that ordinary people would regard him as a god, in life as well as in death; and then they went back to their place of meditation, though looking back at him and showing their unwillingness to let him go. Apollonius kept the Ganges on his right and Hyphasis on his left, and after ten days' journey from the sacred hill reached the sea… and there they found small trading-stations had been set up, with ferry-boats like the ones in Erythra moored there. The Red Sea is apparently very blue, and is named, as I mentioned, after Erythras, who gave his name to that stretch of sea.[193]

Apollonius bids adieu:

51. When Apollonius had arrived there, he sent the camel back to Iarchas with this letter.

'Apollonius greets Iarchas and the other Wise Men.

‘I come to you by land, and you have shown me the sea; but you also shared your native wisdom with me, and showed me a path through heaven. I will recall all this to the Greeks, and enjoy your conversations as if you were present, unless I have had only a useless, tantalising taste of them. Good-bye, good philosophers.’

The return journey by sea and its marvels:

52. So he boarded a ship, and sailed on a gentle, favouring breeze, wondering at the estuary of the Hyphasis and how dangerous it is where it meets the sea: as I mentioned, it finally runs into rocky, narrow places and over precipices, and after these it pours into the sea through one mouth, proving dangerous to sailors who cling too close to shore.

BOOK IV

Apollonius teaches the ideal of civic patriotism:

8. [Apollonius]… gave the Smyrnaeans a disquisition on security in the conduct of cities, because he saw that they were quarrelling with one another and had no agreed policy. He told them that to behave rightly a city needed unity with faction. This seemed implausible and confusing, so that Apollonius, aware that most of them could not follow his meaning, said, ‘Black and white can never be the same, and sweet and bitter can never mix properly, but unity joined with faction will keep a city from harm. You must understand what I mean in this way. The kind of faction that induces sword-fights and stoning should be avoided by a city, since what it needs is child-welfare, law, and citizens to whom speech and action can be entrusted. But there is a kind of mutual competition for the common good, in which one man seeks to give better advice than another, or to hold office better than another, or go on an embassy, or erect finer buildings than when another man was commissioner: and this, I think, is beneficial strife, faction between citizens for the public good. The idea that every man should have different pursuits and contribute them to the public benefit was long ago considered foolish by the Spartans: they practiced the arts of war, and war was their whole passion and their only interest. But in my opinion it is best that everybody does what he knows and what he can. If one man has a high

reputation for persuasiveness, another for wisdom, another for using his wealth for the public good, another for his virtue, another for his implacable severity towards wrongdoing, another for his incorruptibility, the city will be firmly grounded, or rather exalted.'

BOOK VI

Apollonius goes to meet the Naked Philosophers of Egypt:

6. They set out from there at sunrise, and before noon reached the Naked Philosopher's place of meditation. These Naked Philosophers apparently live on a hill of moderate height a little distance from the bank of the Nile. In wisdom the Indians surpass them to a greater degree than they themselves surpass the Egyptians. They go naked except for garments like those of sunbathers at Athens. There are a few trees in their enclosure and a rather small grove where they gather to discuss community affairs. Their sanctuaries are not built in one place, like the Indian's, but in different places on the hill, and are highly regarded, so the Egyptians say. They worship the Nile particularly, because they consider it to be earth and water. For themselves they do not need huts or houses, and live out under the open sky, but they have built a shelter, sufficient to house their visitors, in the form of a fairly small colonnade about the length of the ones at Elis in which the athletes wait for the announcement at noon.

Damis discovers a mean trick by Euphrates:

7. At this point Damis recounts a trick of Euphrates[194] which should be regarded not merely as silly but disgraceful by the standards of philosophy. He had heard Apollonius many times express a wish to compare Indian and Egyptian wisdom. He therefore sent Thrasybulus of Naucratis to the Naked Philosophers to slander Apollonius. Thrasybulus said that he had come to converse with them and that the man from Tyana was coming too. This promised no small trouble for them, he said, because Apollonius was wiser than the sages of India, whom he extolled in every conversation, and had devised endless tests for the Naked Philosophers; he himself was not inferior to the sun or sky or the earth, because he could move and transport them to any new place he wanted.

8. When the man from Naucratis had hatched his plot, he left, while the Naked Philosophers believed him entirely. When Apollonius arrived, they did not refuse an interview but pretended that they were attending to important affairs which were occupying them; they would, however, come to talk with him if they had time and were informed what he wanted and what his aim was in coming. Their messenger also invited the party to stay in the colonnade, to which Apollonius replied, 'You do not need to mention shelter, because the climate here is such that nobody needs a covering.[195] However, I am not surprised that these people do not yet know what I want and why I have come: the Indians, on the other hand, did not ask me that'.

Damis sets things right:

9. Apollonius lay under one of the trees, and answered any question his disciples put to him, while Damis took Timasion aside and asked him privately, 'You have met these Naked Philosophers, I suppose my friend: what are the subjects of their knowledge?'

'There are many important subjects,' he replied.

'Still, it is not wise of them, sir,' said Damis, 'to act like this with us. Refusing to converse with a man like this one about philosophy and putting on airs with him are things I can only describe as insolence, my friend.'

'Insolence?' said Timasion. 'That is something I have never seen in them, though I have been here twice before. They have always been courteous and kind to visitors. Why, not long ago, two months back perhaps, there was a Thrasybulus staying here, a man without any distinction in philosophy, and yet they greeted him warmly, because he called himself a follower of Euphrates.'

'What did you say, young man?' asked Damis. 'Did you see Thrasybulus of Naucratis in the community here?'

'Not only that,' said the boy, 'but I took him in my own boat when he was returning from here.'

'I see it all, for heaven's sake,' said Damis, with a shout of indignation; 'there has been a trick, it seems.'

Timasion replied, 'When I asked the master's name yesterday, he did not let me into the secret; so tell me who it is, if you are not sworn to silence. I might be able to help you in finding what you are looking for.' When he

was told by Damis that it was the man from Tyana, he said, ‘You were right. When Thrasybulus was sailing down the Nile with me, I asked him why he had come up here, and he described a dishonorable trick of his. He was claiming he had made the Naked Philosophers full of suspicion about Apollonius so that he would be disregarded when he arrived. Why he is an enemy of his I don’t know, but to resort to slander seems to me womanish and ignorant. I could find out their attitude by talking to them, because they are friends of mine.’

Timasion came back at evening, and said nothing to Apollonius, except that he had talked to them, but reported to Damis privately that they would be coming the next day, filled with Thrasybulus’s stories.

The Naked Philosophers invite Apollonius:

10. The next day Apollonius was absorbed in contemplation of something, after worshipping the sun in his usual way, when Nilus, the youngest of the Naked Philosophers, ran up to him and said, ‘We are coming to you.’

‘That is reasonable,’ said Apollonius, ‘since I came to you here all the way from the sea,’ and with these words followed Nilus. He and the philosophers met by the colonnade, and after he had greeted them and received a greeting in return, he said, ‘Where shall we talk?’

‘Here,’ said Thespesion pointing to the grove. This Thespesion was the senior among the Naked Philosophers, and he walked at their head while they followed him at a dignified and leisurely pace, like Judges of the Hellenes behind the chief Judge. Then they sat down anywhere, abandoning their order, and all looked at Thespesion as the chairman of the discussion. He began in this way:

‘I am told that you have visited Delphi and Olympia, Apollonius, since that is what was reported here by Stratocles of Pharos, who said he had met you there. I believe also that Delphi greets its visitors with pipes, songs and lyre-music, and treats them to comedy and tragedy, and only after all this provides the naked competition: Olympia, however, avoids such preliminaries as unbecoming and improper there, and entertains its visitors to the sight of naked athletes according to the arrangements made by Hercules. That is how you must consider our life compared with the philosophy of the Indians. They beguile you with a variety of enchantments,

as if they were inviting you to Delphi, but we are naked, as if we were at Olympia. Here the earth does not provide bedding or produce milk or wine as it does to followers of Bacchus, and the air does not hold us suspended. We make the earth itself our bed, and live off its material products, so that it may supply them willingly and not be tortured against its will. However, to show that we have the power to work miracles,' he spoke to a certain tree, an elm which was third in the row from the one under which they were conversing, and said to it, 'Speak to the wise Apollonius.' The tree spoke to him as it was told, and its voice was articulate and feminine.

He made these remarks about the Indians in the belief that he would convert Apollonius from his regard for them because Apollonius told everybody about the words and the deeds of the Indians. Thespesion added that it was enough for a wise man to keep himself undefiled by the flesh of living things, by the desire that enters through the eyes, and by jealousy which visits hands and hearts to teach them evil, and that truth did not need miracles and magic arts.

'Look at Apollo of Delphi,' he said. 'He dwells in the middle of Greece to dispense oracles. As you know yourself, anybody needing the god's advice asks a brief question, and Apollo tells all he knows without any miracles. It would be easy for him to shake all of Parnassus, to change the waters of Castalia and make them wine, or to stop the Cephisus from being a river. But Apollo reveals the simple truth without any such flourish. We should not think that he even wants to receive the gold or the dedications that we think so fine, or that he prides himself on his temple, nor would he even if it were to be made twice the size it now is. This god once lived in a humble cottage; a little hut was made for him to which the bees contributed wax and the birds their feathers. Thrift is the teacher of wisdom, as it is of truth, and if you follow it you will be considered entirely wise, and will forget the stories you heard from the Indians. "Do this" or "don't do this", "I know" or "I don't know", "this but not that" do not need pomp or storms, or rather brainstorms.

'You have seen in descriptions or pictures the Hercules of Prodicus. Hercules is a youth and has not yet chosen a way of life, and Vice and Virtue both take hold of him and try to draw him to their side. Vice is adorned in gold, ornaments, purple robes; her face is made up, her hair coiffured, and her eyes pencilled; and she has golden shoes, since she is

shown flaunting these too. Virtue, however, looks like a woman used to work, with a frowning expression, with wrinkles instead of cosmetics, with bare feet and squalid clothing, and in fact she would appear naked except that she observes the feminine proprieties. Well, Apollonius, think of yourself standing between the wisdom of India and Egypt. You can hear the Indian kind saying it will strew flowers for you when you go to sleep, give you milk to drink, for heaven's sake, and honey to eat: you will have nectar and wines whenever you like; it will wheel in tripods and golden thrones for you when you drink, and you will have no work; everything will come of its own accord. But you can hear Egyptian philosophy saying that it's your duty to sleep on the bare ground, to be seen working naked, like us, not to think anything welcome or pleasant unless it is the fruit of your labour, not to boast or to be fond of vanity, and even to avoid visions that lift you from the earth. If you were to choose like Hercules, showing an iron will and not disregarding the truth or shunning a humble life according to nature, you will be able to say that you have captured many lions and exterminated many hydras, Geryons and Nessuses, and all the creatures that fell before Hercules. If you choose the life of those parasites, however, you will be indulging your eyes and ears, you will be thought no better than anyone else, and you will turn out to have fallen before a Naked Philosopher of Egypt.'

Apollonius explains his philosophy of the soul:

11. When he had spoken, the company turned towards Apollonius. His followers knew that he would answer, but Thespesion's party wondered what he could say. Apollonius praised Thespesion for his fluency and power, and said, 'Do you have anything to add?'

'Of course not,' he said, 'I have finished.'

'Does any of the other Egyptians?' asked Apollonius.

'You heard them all,' replied Thespesion, 'when you heard me.'

Apollonius then was silent for a little while, with his attention concentrated on what Thespesion had said; and then he began, 'Your account, Wise Men of Egypt, of Hercules's choice, which according to Prodicus he made as a young man, was wise and true to the spirit of philosophy, but it has nothing to do with me. I have not come here to take your advice about a way of life, since I long ago chose the one that seemed

right to me. I am also older than all of you except Thespesion, so that, I, your visitor, would have been better suited to advise you about choosing a philosophy, except that I find you have already chosen one.

'However, old as I am, and far advanced in wisdom, I will not hesitate to let you inspect my choice, and will show you how right I was to choose my path, since I have never observed a better one. I saw a sign of greatness in Pythagoras. His mysterious philosophy not only enabled him to know his own true self but also his past identity; he approached altars in purity, he kept his stomach undefiled by the flesh of living things, and his body uncontaminated by all clothes made from dead creatures; he was the first man to hold his tongue by inventing "the ox on the tongue" as a rule of silence.[196] The rest of his philosophy was oracular and true. I therefore ran to embrace his doctrines. I did not choose one philosophy out of two, as you advise, Thespesion. Philosophy set the whole variety of her doctrines before me, adorning each with its own special charms, and then told me to look at them and choose wisely. All of them had a venerable, divine beauty, and some were such as to make other men dazzled with amazement. I, however, looked steadily at them all, as they themselves encouraged me to do, by trying to win me over and by promising all the things they would give me. This one said that without any toil I would taste a great feast of pleasures (Epicureanism); that one, that I would toil, and then rest (Stoicism); another, that she would mix delights with toil (Peripateticism), and on every side I could see pleasures, all restraints on gluttony abandoned, hands grasping for wealth, the eyes unblinkered; love, desire and all such experiences were permitted. Another philosophy boasted that she would restrain me from such things (Cynicism): She was rude, quarrelsome, and contemptuous of everything. But I saw a mysterious kind of philosophy, which once won the devotion of Pythagoras. She was not standing in the crowd, but apart from them and in silence. Seeing that I resisted the others, but did not yet know her own gifts, she said, "Young man, I have no pleasures, and am full of labour. A man who joins my society must choose to put aside all food that consists of living flesh: he must forget wine, and not cloud the vessel of wisdom that stands in the hearts of those that drink no wine. No cloak or wool shorn from a living creature shall warm him, and I give him shoes of bark and the ground he stands on as a bed. If I see him

yield to sex, I have abysses to which justice, the servant of wisdom, takes him and pushes him down. So harsh am I to those that choose my way that I have bits to curb their tongues. But let me tell you what the reward is if you endure all this. You will of course be self-controlled and just: you will need to envy no one: you will terrify tyrants rather than be in their power: you will please the gods more with humble sacrifices than those who spill the blood of bulls for them, and being pure you will receive from me the gift of foreknowledge, and I will so fill your eyes with radiance that you will recognise gods, know heroes, and unmask insubstantial ghosts when they hide in mortal form."

"This is the way of life I have chosen, Egyptian philosophers. I chose it honestly and by Pythagoras's example, and I neither deceived myself nor was deceived, because I have become what a philosopher should become, and I have been given all that my philosophy said it would give me if I did. My philosophy has been concerned with the being and the origins of the art: and I have observed that it belongs to men who are expert in divine science and have the truest conception of the soul, because it is the soul, subject neither to death nor to birth, that is the source of being.'

Nilus asks about Apollonius' talks with the Indian philosophers:

12. Damis says that when he heard this, he breathed again, since Apollonius' words had such an effect on the Egyptians that Thespesion could be clearly seen blushing, black though he was. The others too showed amazement at Apollonius' conviction and eloquence, and the youngest of the Egyptians, who was named Nilus, apparently jumped up in admiration, and going over to Apollonius gave him his hand and asked him to tell about the conversation he had had with the Indians.

Apollonius replied, 'I would have no objection to telling you anything, because I can see you are willing to listen and are friendly to every kind of philosophy, but I would not care to burden Thespesion with talk of the Indians, or anybody else who considers their wisdom nonsense.'

Thespesion then said, 'Suppose you were a merchant or a captain bringing some cargo to us from there. Would you expect to dispose of it without submitting it to examination, just because it was from India, and not allow it to be tested or seen?'

‘If anybody wanted,’ replied Apollonius, ‘I would let them inspect it. But suppose somebody came down to the shore when my boat had just put in, and denounced my cargo, accusing it of coming from a land that produced nothing good; and suppose he attacked me for trading in debased goods, and persuaded everyone else to believe him. Do you imagine that someone who had sailed into such a harbour would let out his anchor or cable at all? Wouldn’t he rather hoist his sails and put out again to the open sea, and trust his goods to the breeze rather than to undiscriminating and unfriendly people?’

‘Well, said Nilus, ‘I grasp the cables and beg you, captain, to give me some of the cargo you have. I would be willing to come on your ship as a deck-hand and look after the cargo.’

Apollonius answers the false charges against himself:

13. Thespesion, wanting to cut this talk short, said, ‘I am glad, Apollonius, that what you have heard annoys you. You will be all the readier to pardon us for being annoyed at the way you criticised our philosophy when you had not yet come to test it.’

For a moment, Apollonius was taken aback by these words, not yet having heard the story about Thrasybulus and Euphrates. Then, seeing what had happened, as he usually did, he said, ‘No, Thespesion, the Indians would have reacted differently. They would not have listened to Euphrates when he put this story about, because they have the gift of foreknowledge. My quarrel with Euphrates was not about any personal matter. I tried to wean him from moneymaking and from being satisfied with profit wherever it came from. But it seems that my advice was inappropriate and beyond his power. He thinks it was condemnation, and never stops devising some new plot against me.

‘You believed him when he slandered my character, but you must remember that he slandered you rather than me. It seems to me that a man who is destined to incur slander will run into no small danger and be hated when he has done no harm: but those who listen to slander will be proved to esteem falsehood and to put as high a value on it as on truth; second, they will be convicted of silliness and gullibility.”

14. Nilus, full of eagerness to listen to Apollonius, said, ‘Well, it is you that should begin the conversation by telling us about your journey to the country of the Indians and your conversations there. They must have been on exalted subjects.’

‘For my part,’ said Thespesion, ‘I am keen to hear about the wisdom of Phraotes, since I am told you have brought from India precious extracts from his conversation.’ Apollonius therefore began with their experiences in Babylon, and described their whole story, while the Egyptians were delighted to listen, and hung on his words. When noon came, they ended their conversation, since this is a time which the Naked Philosophers as well devote to religion.

BOOK VII

Apollonius, arrested by Domitian, philosophises on ways of dealing with tyrants:

30. The clerk then left, while Apollonius lay down on his bed and said, ‘I need sleep, Damis. I have had a bad night trying to recall something I once heard from Phraotes.’

‘But you ought to stay awake, rather’, said Damis, ‘and prepare yourself for the appointment, since it is so important.’

‘How could I prepare myself,’ asked Apollonius, ‘when I don’t yet know what he is going to ask?’

‘Are you going to improvise, then,’ asked Damis, ‘when your life is at stake?’

‘Yes, Damis,’ he replied, ‘just as I improvise in life itself. But I want to tell you the remark of Phraotes which I recalled, because you will consider it useful in the circumstances too. Phraotes advises that we should not hit the lions which people make pets of, because they bear resentment if they are hit, and we should not spoil them because that makes them capricious. Instead, we should mix caresses with threats, and so educate them to ways of obedience. He was not of course referring to lions, since our conversations were not about raising pets, but giving me a rein to use with tyrants, which he thought would prevent me from leaving the proper path.’

‘That saying,’ replied Damis, ‘is a very appropriate description of a tyrant’s character, but there is also in Aesop the lion in the cave, which Aesop says was only pretending to be ill, and caught the animals that came to visit it. But the vixen said, “what am I to make of this creature? Nobody comes away from him: there is no trace of anybody coming out.”

Apollonius replied, ‘For myself, I would have thought the vixen more clever if she had gone inside without being caught, and had left the cave making her own traces.’

BOOK VIII

Apollonius mocks at his accusers in a rigged trial:

7 (iv). ‘However, I do not want to stray into a discussion of folly, so I will ask my accuser what subject I should begin with. There is no need to ask: it was my clothing that he devoted the beginning of his speech to, and, for that matter, what I eat and do not eat. Defend yourself on this charge, divine Pythagoras, since we are on trial for customs that you began and I follow.

‘… As for the Indians and Egyptians, the Egyptians criticise the Indians in every way, and speak ill of their beliefs about material objects: but they have such a high opinion of the Indians’ doctrine about the creator of the universe that they teach it to others, although it is Indian.

‘This doctrine recognises god as the creator of the universe in its origin and in its essence. What inspired him to this act was goodness; and since the ideas are related to one another, I affirm the Indians’ doctrine and believe that men who are good have some share in godhead. The order formed by god’s creation must be understood to be everything in heaven and sea and earth, in all of which all men have an equal share, except if chance forbids them…

‘What kind of defence is appropriate? I did not sacrifice, I do not; I do not touch blood, even if it is on the altar, since that was the doctrine of the Naked Philosophers of Egypt and the Wise Men of India, from whom Pythagoras and his sect derived the seeds of their philosophy.’

Apollonius has a vision of the murder of Domitian as it actually happens:

(25) The time had come in which the gods were deposing Domitian from his supremacy over mankind. He had just executed Clemens, a man of consular rank, to whom he had given his sister's hand, and had issued an order about two or three days after the murder that she was to join her husband.[197] So Stephanus, a freed man of hers, who was foretold by the shape of the portent, was led by consideration for the murdered man, or for all Domitian's victims, to make a plot against the tyrant equal to that of the most freedom-loving of the Athenians.

…Stephanus, attacking him when he was off his balance, drew the knife from the concealment of his arm and drove it through Domitian's thigh; the blow was not so accurate as to be immediately fatal, but accurate enough to be fatal later. The emperor, who had always been of strong physique, and was then about forty-four, grappled with Stephanus after the blow, knocked him down, and pinned him, and then gouged his eyes and beat his face with the stem of a golden cup which had been lying there for use in ritual; at the same time he called on Athena for help.

26. All this happened in Rome, but was seen by Apollonius in Ephesus. He was holding a discussion in the woods of the park about noon, the very time when the events in the palace took place. First he dropped his voice, as if afraid; then his exposition lost some of its usual clarity, as happens when a man is distracted by something in the middle of his arguments; then he fell silent, as people do when they have lost the thread. He stared hard at the ground, stepped three or four paces forward, and shouted, 'Strike the tyrant! Strike him!' it was not as if he was observing some reflection of truth through a mirror, but as if he was seeing the real thing and seeming to take part in the action.

The tyrant was slaughtered today. Why do I say today? Just now, I tell you, just now, about the moment when I fell silent in my talk.' Those in Ephesus thought this was madness, and although they wanted him to be right, were afraid of the risks if they listened. 'I am not surprised,' said Apollonius, 'that you do not believe what I say yet, when not even all of Rome knows about it. But look, Rome is finding out now; the rumour is spreading; now ten thousand believe it, now twice as many are leaping in joy, now twice as many as that, now four times as many, now all the cities there. This messenger will get here too; and you may postpone celebrating

with a sacrifice to the time when the news arrives, but I am going to thank the gods for what I have seen.'

27. The story had still gained credence when messengers came with the good tidings and confirmed Apollonius' wisdom. The assassination of the tyrant, the day on which it had come (18 September, AD 96), the noon hour, the assassins whom Apollonius had urged on, proved to correspond in every detail with what the gods had revealed to him during his discourse.

Thirty days later a letter came from Nerva that he now held power in Rome, thanks to the advice of the gods and of Apollonius, but he would retain it more easily if Apollonius came to advise him.

CHAPTER — 10

Fragmentary References on India

Diodorus Siculus

Greek historian Diodorus Siculus (the Sicilian) was born at Agyrium in Sicily, and lived in the second half of the first century BC. He claimed to have travelled in Egypt between 60 and 57 BC and mentioned events occurring in 21 BC. He wrote in Rome during the days of Julius Caesar and Emperor Augustus, spending nearly thirty years writing *Bibliotheca Historica* (Historical Library), which comprised forty books, of which only books I to V and XI to XX are intact. The rest survive in fragments preserved in later works. The extant books contain Alexander's India campaign, a general description of India, and some incidental notices on India. The extracts are based on the English translation of McCrindle.[198]

BIBLIOTHECA HISTORICA
BOOK XVII, CHAPTER LXXXIV

Alexander at Massaga - treachery towards Indian mercenaries and valour of Indian women:

When the capitulation on those terms had been ratified by oaths, the Queen [of Massaga], to show her admiration of Alexander's magnanimity, sent out to him most valuable presents, with an intimation that she would fulfil all the stipulations. Then the mercenaries at once, in accordance with the terms of the agreement, evacuated the city, and after retiring to a distance of eighty stadia, pitched their camp unmolested without thought of what was to happen. But Alexander, who was actuated by an implacable enmity against the mercenaries, and had kept his troops under arms ready for action, pursued the barbarians, and falling suddenly upon them, made a great slaughter of their ranks. The barbarians at first loudly protested that they were attacked in violation of sworn obligations, and invoked the gods whom he had desecrated by taking false oaths in their name. But Alexander with loud voice retorted that his covenant merely bound him to let them

depart from the city, and was by no means a league of perpetual amity between them and the Macedonians. The mercenaries, undismayed by the greatness of their danger, drew their ranks together in the form of a ring, within which they placed the women and children to guard them on all sides against their assailants. As they were now desperate, and by their audacity and feats of valour made the conflict in which they closed hot work for the enemy, while the Macedonians held it a point of honour not to be outdone in courage by a horde of barbarians, great was the astonishment and alarm which the peril of the crisis created. For as the combatants were locked together fighting hand to hand, death and wounds were dealt round in every variety of form. Thus the Macedonians, when once their long spikes had shattered the shields of the barbarians, pierced their vitals with the steel points of these weapons, and on the other hand the mercenaries never hurled their javelins without deadly effect against the near mark presented by the dense ranks of the enemy. When many were thus wounded and not a few killed, the women, taking the arms of the fallen, fought side by side with the men for the imminence of the danger and the great interests at stake forced them to do violence to their nature, and to take an active part in the defence. Accordingly some of them who had supplied themselves with arms, did their best to cover their husbands with their shields, while others who were without arms did much to impede the enemy by flinging themselves upon them and catching hold of their shields. The defenders, however, after fighting desperately along with their wives, were at last overpowered by superior numbers, and met a glorious death which they would have disdained to exchange for a life with dishonour. Alexander spared the unwarlike and unarmed multitude, as well as the women that still survived, but took them away under charge of the cavalry.

BOOK II

General abundance and wealth of India:

II. 36. The inhabitants, in like manner, having abundant means of subsistence, are of unusual height and bulk of body. They are also found to be well skilled in the arts, as might be expected of men who inhale a pure air and drink the very finest water. And while the soil bears on its surface

all kinds of fruits which are known to cultivation, it has also under ground numerous veins of all sorts of metals, for it contains much gold and silver, and copper and iron in no small quantity, and even tin and other metals, which are employed in making articles of use and ornament, as well as the implements and accoutrements of war.

Climate and double-cropping:

In addition to cereals, there grows throughout India much millet, which is kept well watered by the profusion of river-streams, and much pulse of superior quality, and rice also, and what is called *bosporum*, as well as many other plants useful for food, of which most are native to the country. The soil yields, moreover, not a few other edible fruits fit for the subsistence of animals, about which it would be tedious to write. It is accordingly affirmed that famine has never visited India, and that there has never been a general scarcity in the supply of nourishing food. For, since there is a double rainfall in the course of each year - one in the winter season, when the sowing of wheat takes place as in other countries, and the second at the time of the summer solstice, which is the proper season for sowing rice and bosporum, as well as sesamum and millet - the inhabitants of India almost always gather in two harvests annually; and even should one of the sowings prove more or less abortive they are always sure of the other crop. The fruits, moreover, of spontaneous growth, and the esculent roots which grow in marshy places and are of varied sweetness, afford abundant sustenance for man. The fact is, almost all the plains in the country have a moisture which is alike genial, whether it is derived from the rivers, or from the rains of the summer season, which are wont to fall every year at a stated period with surprising regularity; while the great heat which prevails ripens the roots which grow in the marshes, and especially those of the tall reeds.

Respect to farmers and nature during war:

But, further, there are usages observed by the Indians which contribute to prevent the occurrence of famine among them; for whereas among other nations it is usual, in the contests of war, to ravage the soil, and thus to reduce it to an uncultivated waste, among the Indians, on the contrary, by

whom husbandmen are regarded as a class that is sacred and inviolable, the tillers of the soil, even when battle is raging in their neighbourhood, are undisturbed by any sense of danger, for the combatants on either side in waging the conflict make carnage of each other, but allow those engaged in husbandry to remain quite unmolested. Besides, they neither ravage an enemy's land with fire, nor cut down its trees.

Equality and no slavery:

39. Of several remarkable customs existing among the Indians, there is one prescribed by their ancient philosophers which one may regard as truly admirable: for the law ordains that no one among them shall, under any circumstances, be a slave, but that, enjoying freedom, they shall respect the principle of equality in all persons: for those, they thought, who have learned neither to domineer over nor to cringe to others will attain the life best adapted for all vicissitudes of lot: since it is silly to make laws on the basis of equality of all persons and yet to establish inequalities in social intercourse.

Fair treatment of foreigners:

42. Among the Indians officers are appointed even for foreigners, whose duty is to see that no foreigner is wronged. Should any of them lose his health, they send physicians to attend him, and take care of him otherwise, and if he dies they bury him, and deliver over such property as he leaves to his relatives. The judges also decide cases in which foreigners are concerned, with the greatest care, and come down sharply on those who take unfair advantage of them.

*

EXTRACTS ON THE BRAHMANS

Bardesanes of Babylon

Scholars differ whether Bardesanes, who wrote about the Indian Gymnosophists and whom Porphyry called the Babylonian, was the same as Bardesanes of Edessa (a city in Mesopotamia), who was born in AD 154 and wrote in Syriac against Marcion and other heretics. Bardesanes the

Babylonian acquired his knowledge of India from members of an embassy probably sent to Emperor Marcus Aurelius Antoninus Elagabalus. While Bardesanes' work is lost, an extract was preserved by Porphyry (AD 233-306) in the Fourth Book of his treatise *On Abstinence from Animal Food*. Two extracts from his work were preserved by Johannes Stobaeus (probably around the early sixth century), who compiled a valuable series of extracts from Greek authors.

PHYSICA, I. 56. GAISFORD'S EDITION

On judging one's whole life:

They (the Indian envoys) told me further that there was a large natural cave in a very high mountain almost in the middle of the country,[199] wherein there is to be seen a statue of ten, say, or twelve cubits high, standing upright with its hands folded crosswise - and the right-half of its face was that of a man, and the left that of a woman; and in like manner the right hand and right foot, and in short the whole right side was male and the left female, so that the spectator was struck with wonder at the combination, as he saw how the two dissimilar sides coalesced in an indissoluble union in a single body.[200] In this statue was engraved, it is said, on the right breast the sun, and on the left the moon, while on the two arms was artistically engraved a host of angels (*devas*) and whatever the world contains, that is to say, the sky and mountains and a sea, and a river and ocean, together with plants and animals - in fact, everything. The Indians allege that the deity had given this statue to his son when he founded the world as a visible representation thereof. And I inquired, adds Bardisanes, of what material this statue was made, when Sandanes assured me, and the others confirmed his words, that no man could tell what the material was, for it was neither gold, nor silver, nor brass, nor stone, nor indeed any known substance, but that though not wood it most resembled a very hard wood, quite free from rot.[201] And they told how one of their kings had tried to pluck out one of the hairs about the neck, and how blood flowed out, whereat the king was so struck down with terror that, even with all the prayers of the Brachmans, he hardly recovered his senses. They said that on its head was the image of

a god, seated as on a throne, and that in the great heats the statue ran all over with sweat, so copiously discharged that it would have moistened the ground at the base, did not the Brachmans use their fans to stop the flux.[202] Farther on in the cave, a long way behind the statue, all, the Indians say, was dark, and those who wish, go in advance with lighted torches till they come to a door from which water issues and forms a lake around the far end of the cave. Through this door those must pass who desire to prove themselves. Those who have lived unstained with vice pass through without impediment, the door opening wide to them, and find within a large fountain of water clear as crystal and of sweetest taste - the source of the stream spoken of. The guilty, however, struggle hard to push in through that door, but fail in the attempt, for it closes against them. They are thus compelled to confess their offences against others, and to entreat the rest to pray for them. They also fast for a considerable time.

Sandanes further stated that himself and his companions found the Brachmans on an appointed day assembled together in this place, that some of them spent their life there, but that others come in the summer and autumn when fruit is plentiful both to see the statue and meet their friends, as well as to prove themselves whether they could pass through the door. At the same lime, it is said, they examine the sculptures on the statue and try to discover their meaning, for it is not easy to attend to the whole representation, the objects being numerous, while some of the plants and animals are not to be found in any part of the country. Such then is the account which the Indians give to the ordeal by water.

Pseudo-Kallisthenes

Aristotle's nephew, Kallisthenes, accompanied Alexander to Asia, but offended the king by reproaching him for introducing the dress and manners of the Persian Court into his own. At Baktra, he was accused of instigating the conspiracy of the Court Pages and executed. The Romance History was falsely ascribed to him. C. Muller, editor of *Geographi Graeci Minores* and other classical texts, published in 1846, along with the *Anabasis* and *Indika* of Arrian, the Romance History of Alexander the Great under the title *Pseudo-Kallisthenes.* In the midst of conversations between Alexander and the Brahmans is abruptly inserted a small treatise *About the Nations of*

India and the Brachmans, which does not belong to the *History of Alexander,* but to the *Lausiac Histories* of Palladius, who wrote about 420 AD. Muller subjoined the Latin version of this work prepared by St. Ambrose. The English translation is from the Greek text.

Book III. vii. We then, prompted by our regard for you, in addition to what we have already related, will further give you a description of the life of the Brachmans, whose country I have neither visited, nor met with any of its people; for they live far remote, dwelling near the Ganges, the river of India and Serica…

Now, for what I have been able to learn about the Brachmans I am indebted to a certain Theban scholar, who willingly left his home to travel abroad, but had unwillingly to endure captivity. This person, so he told me, was unfitted by nature to succeed in the legal profession, and regarding it with indifference, resolved to explore the land of the Indians….

ix. The traveller stated that the Brachman nation was not an order like that of the monks, which one could enter if he chose – but a society, admission into which was allotted from above by the decrees of God. They live in a state of nature near the river, and go about naked. They have no quadrupeds, no tillage, no iron, no house, no fire, no bread, no wine, no implement of labour, nothing tending to pleasure. The air they breathe is at once bracing and temperate, and altogether most delightful. They reverence the Deity, and are not so scant of wit as to be unable to discern aright the principles of divine Providence. They pray without ceasing, and, while so engaged, instead of looking towards the East, they direct their eyes steadfastly towards heaven without averting their gaze to the East. They subsist on such fruits as chance offers, and on wild lupines that grow spontaneously. They drink water as they roam about the woods, and they take their repose on the leaves of trees. In their country *persunon* (elecampane?) grows abundantly and acantha wood, and the soil elsewhere yields fruits for the sustenance of man. And the men dwell by the shores of the ocean on yonder side of the river Ganges, for this river discharges its waters into the ocean – but their women live on the other side of the Ganges towards the interior of India. The men cross over to their wives in the months of July and August. These months are colder with them than the

other months, because at that season the sun is elevated in our direction and over the North; and it is said that the temperature is more exhilarating and adapted to excite the sexual desires. After spending forty days with their wives they recross the river. When the wife has borne two children, her husband does not again cross over nor go near his wife. When, therefore, they have given sons as their substitutes, they abstain for the rest of their lives from intercourse with their wives. But if it happens that a wife proves barren, her husband crosses over to her for five years and cohabits with her. And if she does not then bear a child, he no longer goes near her. The race accordingly does not multiply much, both because of the hardships to which life is exposed in these regions, and also the strict control of the impulse to procreation. Such is the body politic of the Brahmans.

KOSMAS INDIKOPLEUSTES

Kosmas Indikopleustes was an Alexandrian monk who wrote *Christian Topography* to refute the Ptolemaic system which held that the earth and the heavens are spherical. Despite this absurdity, his work is valued for important notices on history and geography. He wrote around the mid-sixth century AD, when Greek learning and culture was being eclipsed by rising mediaeval ignorance. Kosmas was a merchant in his youth, and thus visited regions far from his birthplace: Alexandria, sailed upon the Mediterranean Sea, the Red Sea, and the Persian Gulf. He traversed much of Ethiopia (the vast region southward from Egypt to the Equator). The title Indikopleustes (Indian navigator) suggests he made a voyage to India. Some scholars doubt this, yet his description of Ceylon and the Malabar coast and the nature of commerce on the eastern seas is so accurate that it seems to have been penned by a personal observer.

ON CERTAIN INDIAN ANIMALS

FROM KOSMAS INDIKOPLEUSTES *DE MUNDO*, XI

Rhinoceros:

1. This animal is called the rhinoceros from having horns growing upon its nose. When it walks about the horns shake, but when it looks enraged it

tightens them, and they become firm and unshaken so that they are able to tear up even trees by the roots, such especially as stand right in their way. The eyes are placed as low down as the jaws. It is altogether a most terrible animal, and is especially hostile to the elephant. Its feet and its skin closely resemble those of the elephant. Its skin, which is dry and hard, is four fingers thick – and from this instead of from iron some make ploughshares wherewith they plough their lands.

Taurelaphos or ox-deer:

2. This is an animal found in India and in Ethiopia. But those in India are tame and gentle, and are there used for carrying pepper and other stuffs packed in bags; these being slung over the back one on each side.

Agriobous or wild ox:

4. This is an animal of great size and belongs to India, and from it is got what is called the *toupha*, wherewith the captains of armies decorate their horses and their standards when taking the field. They say of it that if its tail be caught by a tree it no longer stoops, but remains standing through its unwillingness to lose even a single hair. On seeing this the people of the neighbourhood approach and cut off the tail, and then the creature flies off when docked entirely of its tail.

Moskhos or Musk-deer:

5. The moschus is a small animal (about three feet long), and is called in the native dialect *Kastouri.* The hunters pierce it with arrows, and having tied up the blood collected at the navel, cut this away, for this is the part which has the pleasant fragrance known to us under the name of musk.[203] The rest of the carcass is then thrown away.

Piperi-Pepper:

8. … the pepper tree. Each separate plant clings for support to some tall tree which does not yield fruit, being very weak and slender like the delicate tendrils of the vine. Each cluster is enveloped within a couple of leaves. It is perfectly green like the colour of rue.

Argellia or coconut tree:

9. There is another tree of this sort called *argellia*, that is – the tall nut-trees of India. It differs in no respect from the date-palm except in being taller and thicker and having larger leaves. It produces no other fruit than two or three flower-spathes, each having as many nuts. The taste is extremely sweet and pleasant, being like that of the kernels of green nuts. The nut is at first full of a deliciously sweet water which the Indians therefore drink instead of wine. This very sweet beverage is called *rhongkhosoura*. If the fruit is gathered at maturity, then so long as it keeps its quality, the water in the course of time hardens upon the shell, while the water in the centre retains its fluidity till it finally disappears. If however it be kept too long without being opened, the concretion on the shell becomes rancid and unfit for human food.

.

CHAPTER — 11

Buddhism in China : A General Outline

Sea voyages and commercial ties between China and India can be traced back to as early as the seventh century BC when Indian merchants began trading in rubies, pearls, and sugar, and established colonies in Pegu, Cambodia, Java, Sumatra and Borneo and trading settlements in southern China and the Malayan peninsula. In the first century BC, Kushans of the Yue-chi (also Yuezhi) tribe in Bactria began to arrive in India, and their rule saw the ingress of Indian sages into China. The earliest reference to India in Chinese works dates from the second century BC and speaks of *Yan-tu* or *Yin-tu*, meaning Hindu, and *Shin-tu* meaning Sindhu.[204]

Under King Asoka these nascent contacts easily yielded to a lively religious traffic that persisted for several centuries thereafter, by both land and sea. The Chinese have meticulously recorded the details of this long engagement, but even in India, historical traces are visible in the record of a Chinese embassy to Kanchi (*Houang-tche*) and the unearthing of a Chinese coin of approximately the same period from Chandravalli in Mysore. Chinese annals of the third to the fifth centuries AD reveal that the Hindu kingdoms of Indo-China and the archipelago maintained regular ties with south India and China. They often sent presents of *vaidurya* (cat's eye), sandalwood, and pearls, quintessential south Indian products, to the Chinese court.

Sea traffic was brisk during the seventh and eighth centuries with the mariner's compass and improvement in ship-building. The *Sramanas* who forged cultural ties between India and China availed of the route that merchants on both sides ploughed through the sea. I-ching (also I-tsing or Yi Jing) made the first voyage by a Chinese pilgrim. Fa-hien (also Faxian) did not visit the south Indian mainland, but boarded ship from Tamluk to Ceylon (Sri Lanka); his tale about the Deccan and the 'pigeon monastery' is sheer fantasy. He came to India via the more ancient overland route through Central Asia, which became popular in the second century BC.

Buddhism truly arrived in China in the third century BC, under the zealous efforts of King Asoka. This was a period of great turmoil as China was constantly troubled by the Tartar tribe, Yuchi (compelling monarch Che

Hwangti to build the Great Wall in 250 BC), and the Huns. In one conflict with the Huns, the Chinese general Hou Kiuping saw a golden statue of Buddha, which matched reports from Chinese envoy Chang-Kian (who was abducted by the Yuchi but managed to escape after ten years) about the worship of Buddha in Thian (India). The image was brought before the emperor in 121 AD, and is reputed to be the origin of Buddha statues subsequently made in China.

Emperor Wu-ti and his successor Chaou-ti routed the Huns in 60 BC. A branch of the Yuchi (Great Yuchi) established themselves in Kashmir and Kabul. Their chief, Khieu-tsiu-ki (died 35 BC) was succeeded by his son, Yen-kao-ching (Hima Kadphises). In the reign of his successor Kanishka (15 BC-45 AD), according to the *Rajatarangini* (History of Kashmir), Vasumitra organized an assembly in Tamasavana Vihara at the confluence of the Sutlej and Beas, for the last authentic revision of Buddhist scriptures, according to Northern authorities.

Emperor Ming Ti (62 AD) of the Eastern Han dynasty, in his fourth regnal year, had a vision of a golden image, 19 feet high, with a glistening halo, entering his palace. The Literati (scholar-bureaucrats of imperial China, followers of Confucius) interpreted this as a reference to the Buddha. Another version (*Loyang Temples, iv.4*) states: "The golden spirit, speaking to the emperor, said, 'Buddha bids you send to the west countries to search for him, with a view to obtain books and images.'" Ming Ti deputed a mission to the land of the Great Yuchi and to central India. His men returned after eleven years with the Indian Kasyapa Matanga, who translated the *Sutra of 42 Sections* and died at Loyang. Soon after his arrival came Tsu-fah-lan, who assisted him. They had jointly brought five Buddhist texts from India, including the *Sutra of 42 Sections*, the *Dasabhumi Sutra*, and the *Lalitavistara*. These were translated by Imperial order, around 76 AD. As the books and images entered Loyang on a white horse, the Temple of the White Horse was founded.[205]

Buddhism gradually spread through China. The Parthian monk An-shi-kau was listed in the annals in 150 AD as an excellent translator. About 170 AD, Chi-tsin, a Yuchi priest, translated the *Nirvana Sutra*. The Wu prince Sun-k'iuen, soon after an embassy from Marcus Aurelius Antonius, received an Indian monk who translated some Buddhist texts. About 250

AD, Chi-Meng, residing at Kao Tch'ang (Tourfan) translated the Seng-ki-liuh (*Rules of the Priesthood*), which he procured at Kusumpura or Pataliputra. In 260 AD, Shaman Fa-hou (Dharmaraksha) in the reign of the Western Tsin travelled widely in India, acquired proficiency in 36 dialects, and returned to the Imperial court with several Buddhist and Brahman works. Residing at Loyang, he oversaw the translation of 165 texts between 265–308 AD. These included the second version of the *Lalitavistara*, a corrected copy of the *Nirvana Sutra*, and the *Suvarna Prabhasa Sutra*.

Around 300 AD, a foreign priest named Chi-kung-ming translated the *Wei-ma* (*Vimalakirti Sutra*?) and the *Fa-hwa* (*Saddharma Pundarika*). Soon after, the prince of the Chau kingdom, influenced by an Indian monk Bouddhasimha (Fo-to-ching), permitted his subjects to take Buddhist monastic vows. Previously, Indian natives could build temples in the large cities; now Chinese were allowed to become Shamans. At Loyang (Honan-fu) alone, 42 pagodas were built by 350 AD.

Fa-hian lived in this era. He noticed the imperfect rules of discipline observed by the monks of Changan and the fact that translations of Buddhist books so far received in China were largely incorrect. Emperor Yao-hing (397-415 AD) sent an army to Koutche (a kingdom westward of Lake Lob) to bring a learned Indian priest, Kumarajiva, to help arrange correct versions of the principal books available in the country; over 800 monks were deputed to assist him. The Emperor personally attended the conference and Prince Yao-wang and Count Yao-seng helped transcribe the sheets of the new translations.

Simultaneously, Fa-hian undertook a dangerous journey to India to secure correct copies of the holy texts as early monks like Matanga and Tsu-fah-lan had brought vastly disparate scriptures. Internal evidence suggests the *Sutra of 42 Sections* is an ancient text, while the *Dasabhumi Sutra* of the Mahayana School is a much later creation. Yet both books were accorded the same status, thus causing confusion. Fa-hian went to obtain books of a uniform character, that is, those belonging to the Rules of Discipline and the Hinayana school. Five years after his return, the Tsin dynasty was deposed (420 AD) by the fearsome Tartar tribe, the Northern Wei. The Southern Sung dynasty ruled in the southern provinces and he published the *Fo-koue-ki* under their name.

Buddhism underwent several vissicitudes in China, being persecuted during the early period of the Sung and Wei dynasties. Making images and building temples were forbidden, books and images destroyed, many priests executed, and the worship of foreign divinities made a capital offence. There was some relief in 451 AD, as a result of which one Buddhist temple was permitted in each city, and 40 or 50 citizens allowed to become priests. But in 458 AD, a Buddhist priest was implicated in a conspiracy; a royal proclamation thereafter authorised imperial officers to scrutinise the conduct of monks and execute those found guilty.

Buddhism's rapid ascent annoyed the Literati and disciples of Lao-tseu (also Lao Tse, Laotze). In 467 AD, the Wei prince commissioned a 50-foot image of Buddha, using five tons of brass and 6 cwt. of gold; later he renounced the throne and became a monk. Ming Ti, sixth Sung emperor, built a grand Buddhist temple and was chastised by his Literati. In the early sixth century there were over 3000 Indians and 13,000 Buddhist temples in China. The Wei prince and the first emperor of the Liang dynasty (502-550 AD) in the South thrice took Buddhist vows and expounded the *Sutras* to courtiers. In his twenty-sixth regnal year, he entered the T'ung-Tae monastery in Nanking, enraging the Literati.

The Wei Queen deputed Sung-Yun to India to collect Buddhist scriptures; he went with Hwui-Seng and returned with 175 volumes. By now Buddhism had come under the influence of magical arts, and in 515 AD several monks were executed for such practices. But when the King of Siam wrote to Wu-ti offering a 14-foot long hair of the Buddha, he promptly dispatched priests to collect it! Even earlier, around 460 AD, five monks from Ceylon came to China via Tibet, bringing many images, some with alleged miraculous properties.

Yuan Chwang (Hiuen Tsang, Xuanzang) left for India in 629 AD. Returning after sixteen years, he met Emperor Tae-Tsung at Loyang to explain his departure from the country without Imperial permission. Impressed by his account, the Emperor pardoned him and asked him to write a history of the western countries; Chinese artists made maps to illustrate the book, *Si Yu Ki*, which divided India into five parts, hence the reference to *Five Indies* or *Gotenjiku Zu*. Yuan Chwang lived nineteen years after this work and devoted himself to translating texts brought back from India. He completed 740 works in 1335 books. China at this time had 3716

monasteries. At Yuan Chwang's request, the Emperor permitted five new monks to be ordained in each monastery, swelling their ranks by nearly 18,000. Around this time the Nestorian Christians arrived and were permitted to build a church in Changan.

The Confucianists made a comeback in the early eight century and forced 12,000 nuns and monks to return to secular life. Casting images, writing sacred books, and building temples were banned. But Su Tsung (760 AD) and his successor Tae-Tsung (763 AD) were avid believers. Emperor Hien-tsung (819 AD) deputed mandarins to escort Buddha's bone relic to the capital, a fact resented by a minister who was banished to Canton. In 845 AD, another wave of persecution hit Buddhism, but Emperor Wu-Tsung reinstated the faith.

Emperor I-tsung (860 AD) learnt Sanskrit and the Indian mode of chanting, invited monks to his private apartments, and often visited monasteries to the dismay of the Literati. Another relic of Buddha found its way to the Palace and was personally received by the ruler. Soon foreign priests were flocking to China from Korea and Japan to procure books and escort priests to prestigious monasteries in their own countries. Monks from India and neighbouring lands arrived with books and images at Honan-fu, which alone had 1367 Buddhist temples. The tenth century saw renewed persecution of Buddhism.

Kublai Khan (She Tsu), the first Mongol emperor (1280 AD), was a devout Buddhist. He converted Confucian temples to monasteries and persecuted Taoism. Near the end of his reign, a priest from Tibet arrived, and regretting he could not personally dialogue with him, the Emperor directed Kalutanasi, a Mongolian, to learn Tibetan. A year later, the complete translation of Buddhist *Sutras* and *Sastras* from Tibetan and Sanskrit into Mongolian (in Uighur character) was presented to Kublai in 1294 AD, the year of his death.

In 965 AD, Buddhist monk Tai-yuen brought back relics and Sanskrit copies of Buddhist texts on palm leaves, totalling forty volumes. The following year, 157 Chinese priests took the Emperor's permission to visit India to procure more books; but disappeared from history. In the Yuen dynasty, monk Tau-wu, inspired by the story of Fa-Hian, travelled to Kipin (Cophene, Kabul), learned the original language of Buddhist books and

reached India; he returned by sea to Canton. This is the last recorded pilgrimage to India.

Much of the cultural intercourse was at the initiative of the Chinese; hence, the source materials of this story are found in Chinese only. They preserved the names of Indian monks and scholars who took Indian civilisation to their land, as also the Chinese monks who went to India by land and sea in search of the Law. Many perished en route, and when the Chinese government made no efforts to trace them, I-tsing decided to honour their memory and eventually collected brief biographies of nearly 60 monks (a few remained unnamed) who visited India while he was there. They were mostly Chinese, a few Koreans and one from Sogdiana (Khirgiz). They journeyed in the reign of the Great T'ang dynasty, and received patronage and honour from Indian rulers, princes and Buddhist scholars in India. Most were from poor backgrounds, but a few were from aristocratic families with imperial posts.[206]

I-tsing himself suffered privation on the journey: "Many days I have passed without food, even without a drop of water. I was always worried and no spirit was left in me… If, however, a monk happened to reach India after such perilous journey, he would find no Chinese monastery there. There was no fixed place to settle down. We had to move from place to place like a blade of grass swept by wind. I wish to fulfill my desire so that the future generations may know all about the facts. I had heard with my own ears and seen with my own eyes the difficulties the monks had undergone previously."

Once Buddhism arrived in China, there arose the problem of correctly translating the *Sutras* and conveying their complex meanings in Chinese. The sacred texts had to be made available to the people to propagate the philosophy of the new faith. Translation and commentary of Buddhist texts thus emerged as a major occupation of Chinese Buddhism and the capital city of Loyang its most important centre. Important bilingual scholars here included the Parthian monk An Shih-kao, the Indo-Scythian Dharmaraksa and Lokaksema, and Kumarajiva of Kucha. They joined hands with Chinese monk-scholars and translated nearly 1153 Buddhist texts. Chinese monk-scholars like Tao-an, Chih-ch'ien, and Hui-yuan prodded young monks to visit India.

After Tao-an's death in 385 AD, his most renowned disciple, Fa-hien, set off to collect texts on the *Vinaya*. His sixteen-year sojourn (399-414 AD) is recorded in the *Fo-kuo chi* (*Record of the Buddhist Country*). Fa-hien knew Sanskrit well and translated a copious text on the disciplinary code of the *Mahasanghika*. He was followed by Sung-yun and Hui-sheng (518 AD) who left a brief account of their journey. The most prolific writer was Yuan Chwang (629-645 AD), who departed for India secretly, but returned to great honour by the Emperor T'ai-Tsung. The next famous pilgrim was I-ching, born in the reign of the same emperor, and ordained as a monk at the age of fourteen years.

Chinese annals document embassies exchanged between China and the Pallava court of Kanchi in the eighth century and the Chola court in the eleventh. There was considerable commercial traffic between China and south India in these centuries. Chau-Ju-Kua, the Chinese inspector of foreign trade, compiled the *Chu-fan-chi* around 1225 AD, about south Indian kingdoms in the Middle Ages. Mongol emperor Kublai Khan sent several embassies to South Indian states.

Chinese merchant Wang Ta-yuan visited many lands between 1330–1349 AD and penned the *Tai-i-chi-lio* (*Description of the Barbarians of the Isles*), listing 99 countries and ports, notably Colombo, the Maldives, Kayangulam, Eli and Calicut. Early in the fifteenth century, the third emperor of the Ming dynasty commissioned naval expeditions to establish his fame in distant countries, which in turn deputed embassies to the Chinese court. Seven expeditions led by Cheng Ho came to south India. Later, his fellow travellers Fei Hsin and Ma Huan respectively penned the *Hsing-cha-sheng-lan* (*Description of the Star Raft*, 1436) and *Ying-yai-sheng-lan* (*Description of the Coasts of the Ocean,* 1451) which give significant details about Ceylon, Cochin and Calicut before the rise of the Portuguese.

We conclude with a few words about Magadha, who's Emperor Asoka gave Sakya Muni's creed its international dimension. Magadha (modern south Bihar) was one of four important kingdoms in Buddha's lifetime, the others being Kosala, the kingdom of the Vamsas, and Avanti. It was one of the sixteen *mahajanapadas* and its capital was Rajagriha, where Bimbisara and his son Ajatasatru reigned. Later, the capital shifted to Pataliputra. Under Bimbisara, Anga was included in the realm and he was titled king of

Anga-Magadha. His territory comprised of 80,000 villages spanning a circumference of nearly 300 leagues. Ajatasatru annexed Kosala, the only rival kingdom, with help from the Lichchavis.

Bimbisara and Ajatasatru raised Magadha to such heights that till the time of Asoka, the history of northern India was synonymous with that of Magadha. In Buddha's time, Magadha stretched to the river Champa on the east, the Vindhya ranges to the south, the river Son on the west, and the Ganga to the north. The Ganga formed the natural frontier between Magadha and the Lichchavi republic and both had equal rights over the river. When Buddha visited Vaishali, Bimbisara built and decorated a five-league long road from Rajagriha to the Ganga; the Lichchavis did the same on their side. Sakya Muni preached in the Magadhi dialect.

Magadha was a major political and commercial centre in the early Buddhist era. The rulers had cordial ties with their neighbours; Bimbisara and Pasenadi married each other's sisters. He also had an alliance with Pukkusati, king of Gandhara. When Candappajjota of Ujjeni fell sick with jaundice, Bimbisara sent his personal physician, Jivaka, to cure him. Buddha's leading disciples, Sariputra and Moggallana, hailed from Magadha. Under Asoka, Pataliputra's income from the four city gates was 400,000 *kahapanas* daily; the *Sabha* (council) daily yielded another 100,000 *kahapanas*. The farmlands were rich and fertile.

.

CHAPTER — 12

FA-HIEN

Fa-Hien (also Fah-Hian or Faxian), whose family name was Kung, was a native of Wu-yang in P'ing-yang in Shan-hsi province. After three older brothers died in infancy, his father dedicated him to the Buddhist society while keeping him at home. But after he fell dangerously ill, he was sent to the monastery, where he recovered and decided to remain. His father died when he was ten; an uncle urged him to renounce monastic life out of deference to his widowed mother, but he said: 'I did not quit the family in compliance with my father's wishes, but because I wished to be far from the dust and vulgar ways of life. This is why I chose monkhood.' Soon thereafter, he completed his noviciate and took the vows of the full Buddhist order.

Buddhism in China suffered a severe lacuna in the rules of discipline observed by monks, and available translations of Buddhist texts were perceived as flawed. Fa-Hian set off for India to procure complete copies of the *Vinaya-pitaka* and original copies of works unknown to his countrymen. He reportedly visited the capital (Nanking) on his return, and along with the Indian *Sramana* Buddha-bhadra, translated some of the texts procured in India. However, he died before completing this task, at the age of 88 years, at King-chow in the monastery of Sin.

M. Abel-Rémusat published a translation of Fa-Hian's pilgrimage in Paris (1836), but this version of the *Fo-koue-ki* was widely viewed as faulty. Samuel Beal's[207] translation is far more readable than the later version of James Legge; hence we have relied upon it for our extracts. The pilgrim's gullible acceptance of stories of miracles by former Buddhas and Bodhisattvas are included to reflect his mindset and the extent of his travels, though our purpose is to glean insights into how India appeared to a foreign visitor in antiquity.

Fa-Hien is a religious title, and means 'Illustrious in the Law,' or '*Illustrious master of the Law*.' The Catalogue of the imperial library of the Suy dynasty (AD 589–618) mentions Fa-Hien four times, including a

reference to his translation work at Kin-ling (Nanking) with Buddha-bhadra.

Cunningham and Indian geographers and archaeologists have identifed the principal places Fa-Hien touched after crossing the Indus into the Punjab. Most places from Ch'ang-an to Bannu have also been identified. Woo-e is near Kutcha or Kuldja, in 43°25' N., 81°15'E. The country of K'ieh-cha was probably Ladakh, though James Legge thinks he crossed the Indus farther east than Skardo. T'o-leih is identified with Darda in Greenough's '*Physical and Geological Sketch-Map of British India*,' where 'Dardu Proper' lies east of the Indus, as per the narrative. The point at which Fa-hien recrossed the Indus into Udyana is unknown. Taksasila, which he visited, was on the west of the river and has been incorrectly accepted as the Taxila of Arrian in the Punjab.

CHAPTER 1

Setting out for India:

Fah Hian, when formerly resident at Tchang'an,[208] was grieved at noticing the fragmentary character of the *Rules of the Buddhist Discipline*[209] (as then known in China). Whereupon, in the second year of Hung Chi, the cyclical characters being Ki Hae,[210] he agreed with Hwui King, Tao Ching, Hwui Ying, and Hwui Wu, to go together to India to seek for complete copies of these *Rules*.

Setting out, therefore, from Tchang'an, they first of all crossed the Lung (Mountains), and arrived at the country of Kon Kwei,[211] where they sojourned during the season of the Rains. After this they pushed forward, and arrived at the country of Niu Tan;[212] then crossing the Yang Lau Hills they reached the great frontier station of Chang Yeh.[213] This place was in such an unsettled condition that the roads were unsafe for passengers. The Prince[214] of the country prevailed on them to remain there for some time, and himself afforded them hospitality. It was here they fell in with Chi Yen, Hwui Kan, Sang Chau, Po Wan, and Sang King, and pleased to find they

had one common aim in view, they remained together during the season of rains. After this they again set out and arrived at Tun Wang.[215]

They all stopped here a month and some odd days, after which Fah Hian and his four companions made arrangements to set out in advance of the others, and so they were again separated. The military governor of Tun Wang, Li Ho by name, provided them with all necessaries for crossing the Desert (Gobi Desert). In this desert there are a great many evil demons, there are also sirocco winds, which kill all who encounter them. There are no birds or beasts to be seen; but so far as the eye can reach, the route is marked out by the bleached bones of men who have perished in the attempt to cross the desert. After travelling thus for seventeen days, a distance of about fifteen hundred *li*,[216] they arrived at the kingdom of Shen-Shen.[217]

CHAPTER II

Buddhism in Shen-Shen:

This land is rugged and barren. The people dress like the Chinese, except they wear garments made of felt and woollen stuff. The King of this country is well affected to the Law of Buddha. In his dominions are about four thousand priests, all of whom belong to the religious system known as the Little Vehicle (*Hinayana*). The common people and the Shamans[218] of this and the neighbouring kingdoms all follow the religious customs of India, only some more exactly than others. All the kingdoms westward from this, as a rule, have the same characteristics, except that their languages differ, - each using its own dialect of the Tartar language. All the followers of Buddha (*prajarwikas* - those who have renounced their homes), however, practice themselves in reading Indian books, and conversing in that language.

Buddhism in Uighur:

This kingdom also has about four thousand priests, all professing the doctrines of the Little Vehicle. When Fah Tsih and Tsai Tch'ang, two Buddhist priests of the land of Thsin, arrived at this country, they were unable to conform to some of the customs of the religious community. Fah

Hian, therefore, having obtained a pass, proceeded to the palace (hall) of the reigning Prince, Kung Sun, there remained two months and some days; after which, he returned to Po Wan and the rest (who had by this time arrived at the country); but as there was a general dissatisfaction with the want of politeness which the people of the country showed towards their guests, three of the pilgrims, viz., Chi Yan, Hwui Kan, and Hwui Wu, resolved immediately to retrace their steps towards Kao Tchang, for the purpose of obtaining there the provisions necessary for their journey. Fah Hian and the others, in consequence of their possessing a pass, were furnished with all they needed by Kung Sun. After having provided themselves with these things, they immediately set forward in a south-westerly direction. On their route they found neither dwelling-houses or people. The miseries they endured in crossing the rivers, and in surmounting the natural difficulties of the road along which they had to journey, exceed all conception. After being on the road a month and five days, they at last arrived at Khoten (Yu-tien).

CHAPTER III

Mahayana Buddhism in Khoten:

This country is exceedingly prosperous; the people are very wealthy, and all of them, without exception, reverence the Law of Buddha, and take delight in attending to their religious duties. The body of priests may, perhaps, amount to ten thousand men, and principally belong to the system of the Great Vehicle. They all partake of their meals in common. The people of the country build their houses in clusters. Before the doors of their houses they erect small towers. The smallest are about twenty-two feet high. They also construct apartments for foreign priests, where they entertain them as guests, and provide them with all they require. The ruler of the country located Fah Hian and his companions in a *Sangharama*,[219] which was called *Gomati* (Kiu-ma-ti). The priests of this temple belong to the system known as the Great Vehicle (*Mahayana*). At the sound of the gong, three thousand priests assemble together to take their meal. Whilst entering the dining hall they observe the greatest decorum and propriety of conduct; one after another they take their seats. Silence is observed amongst

them all; they make no noise with their rice-bowls, and when they require more food there is no chattering one with the other, but they simply make a sign with their fingers (and so are supplied).

The ceremony of images:

Hwui King, Tao Ching, Hwui Ta, set out in advance towards Ki'a-Cha (Kartchou'), whilst Fah-Hian and the rest, wishing to witness the ceremony of the procession of images, halted here for a period of three months and some days. In this country there are fourteen large *Sangharamas*, without reckoning the smaller ones. On the first day of the fourth month, they begin within the city to sweep and water the roads, and to decorate the streets. Above the chief gate of the city they stretch out a large cloth screen, and ornament the covered space in every possible way, then the King and the court ladies, with their attendants, take their places there. The priests of the *Gomati* temple, belonging to the Greater Vehicle, being chiefly honoured by the King, first take their images in procession. They construct a four-wheeled image-car about three or four *li* from the city, its height is about thirty-five feet, and in appearance like a moving royal pavilion. It is adorned with the seven precious substances, and adorned with silken streamers and flags and curtains. The chief image is then placed upright in the centre of the carriage, with two *Bodhisatwas*[220] in attendance, and surrounded by all the *Devas* (Hindu gods). All are made of gold and silver, whilst glittering gems are hung suspended in the air. When the image is about one hundred paces from the city gate, the King removes his royal head-dress, and putting on new garments, with bare feet he proceeds from the city to meet the procession, holding flowers and incense in his hand, and followed by his suite. On meeting the car he bows down with his face to the ground in adoration, whilst he scatters the flowers and burns the incense. At the time when the image enters the city, the court ladies and their attendants throw down from the pavilion above the gate flowers in endless variety. Thus everything is sumptuously arranged. Each *Sangharama* has its own car, and its own day, for the procession. Beginning on the first day of the fourth month, they continue till the fourteenth day, after which they conclude, and the King and the ladies return to the palace.

CHAPTER V

Quinquennial assembly in Kartchou:

The King of this country holds the quinquennial assembly known as the Pan-che-yu-sse (*pancha-varsa*). At the time of the assembly he invites the priests of the four quarters (of every country) to attend. A vast concourse of them having come together, they then proceed to decorate the priests' session-place with silken flags and canopies. (In the midst) they erect a draped throne adorned with gold and silver lotus flowers, and behind it they arrange the seats for the priests. The king and his attended ministers then proceed to make their religious offerings. It is principally in the spring time that the King convokes the assembly, either during the first, second, or third month. After it is over, the King again exhorts his ministers to prepare and present further religious offerings. This occupies from one to five days more. After this is all done, the King further makes an offering of the horse which he rides, with its trappings, whilst the chief minister, and the principal nobles and officers of the land, offer theirs also; moreover, they make presents of white woollen stuff and every kind of precious thing which the Shamans require. All these things are given as votive offerings by the various ministers of the King. But, after being thus publicly presented by vow, they are redeemed from the priests for a certain value.[221]

Monks invoked for good harvests:

These mountainous regions are so cold that they will produce no cereal but wheat. As soon as the ecclesiastics have gathered in their harvest (received their dues), the weather becomes cloudy and overcast. The King, therefore, usually supplicates the priests to allow all the wheat to ripen before they begin to gather in (receive) theirs. In this country is a stone spitting-vessel of Buddha; it is the same colour as his alms-bowl. There is also one of Buddha's teeth, over which the inhabitants have raised a tower. There are about 1,000 or more priests here, all of them belonging to the system called the Little Vehicle.

CHAPTER VI

They cross the treacherous Tsung Ling mountain and enter north India:

On the confines of this region is a little kingdom called To-li,[222] in which, likewise, there is a congregation of priests belonging to the Little Vehicle. In this kingdom there was, formerly, an Arhat, who, by his spiritual power, transported a sculptor up to the Tushita Heavens to observe size, colour, and general appearance of Maitreya Bodhisatwa (the future Buddha), so that, on his return, he might carve a wooden image of him. Having first and last made three ascents for the purpose of correct observation, he finally completed the image. It was 94ft. high, and the length of the foot of the image 9ft. 4in. On festival days it always emits an effulgent light. The princes of all the neighbouring countries vie with each other in making religious offerings to it. It still exists in this country.

CHAPTER VII

They reach the Indus; Fah-Hian narrates how Buddhism came to China:

At the base there is a stream called the Sin-to (Indus). Men of old days have cut away the cliff so as to make a passage, and have carved out against the rock steps for descent, amounting altogether to 700 in number. Having passed these, there is, suspended across the river, a bridge of ropes, by which travellers pass over it. From one side of the river to the other is eighty paces. According to the records of Kau Yih,[223] neither Chang Kian[224] nor Kan Ying[225] of the Han[226] dynasty, reached so far as this. All the priests asked Fah Hian what he knew as to the time when the law of Buddha began to spread eastward from their country. Hian replied,

"On enquiry, men of those lands agreed in saying, that, according to an ancient tradition, Shamans from India began to carry the sacred books of Buddha beyond the river, from the time when the image of Maitreya Boddhisatwa was set up." Now this image was set up 300 years or so after the Nirvana of Buddha, which corresponds with the time of Pingwang,[227] of the Chau Family. Hence it may be said that the diffusion of the great doctrine may be attributed to the influence of this image. For apart from the

power of the great teacher Maitreya, following in the footsteps of Sakya, who would have been sufficient to cause the knowledge of the three precious ones[228] to be spread so far, that even men on the outskirts of the world acquired that knowledge? We may conclude therefore, with certainty, that the origin of this diffusion of the law of Buddha was no human work, but sprang from the same cause as the dream of Ming Ti.[229]

CHAPTER VIII

Monasteries of Udyana:

Crossing the river we arrive at the country of Ou-chang (Udyana). This is the most northern part of India. The language of middle India is everywhere used. Middle India is that which is called the Middle Country (*Madya Desa*). The clothes and food of the ordinary people are, likewise, just the same as in the Middle Country. The law of Buddha is universally honoured. The names given to places where the priests take up their fixed abodes is *Sangharama*. There are altogether about 500 of these, all of which are attached to the system called the Little Vehicle. If any foreign ecclesiastic (*Bikshu*) arrive amongst them, they are all ready to entertain him for three days,[230] after which they bid him seek for himself a resting place.

Tradition regarding the Buddha:

Tradition says, "When Buddha visited North India, he at once came to this country. When he left he bequeathed to them an impression of his foot." The appearance of the impression is large or small, according to the intensity of the religious feeling of the person who beholds it. It exists to the present day. The stone on which Buddha dried his clothes, and the place where he converted the malevolent dragon (Apalala), still remain. The stone is about 12ft. high and 24 ft. square, and smooth on one side. From this place the three pilgrims, Hwui King, To Ching, and Hwui Ta, went on in advance towards the kingdom of Na-kie (Nagrak[231]) where the shadow of Buddha is to be seen. Fah Hian and the others remained in this country

during the season of the Rains. After this they descended towards the south, and arrived at the kingdom of Su-ho-to (Swat).[232]

CHAPTER XII

In former births, Buddha gave his flesh to save a dove at Udyana; at Gandhara he sacrificed his eyes, at Takshasila he gave his head in charity and also his body to feed a starving tiger. At Peshawar, he predicted the arrival of Kanishka:

In old times Buddha, in company with all his disciples, travelled through this country, on which occasion he addressed Ananda thus, "After my *Nirvana* there will be a king of this country called Ka-ni-ka (Kanishka), who on this spot will raise a Pagoda."

In after times King Kanishka was born, and, on one occasion, as he was going on a tour of inspection, the divine ruler Sekra (Indra), wishing to originate the first thoughts of such a purpose, caused to appear before him a little shepherd boy making a Pagoda on the road. The King then stopped and asked him what he was doing, to which he replied, "I am making a tower in honour of Buddha." The King said, "you are a very good boy," and immediately set about building a great tower over that of the little shepherd boy. The height of it was 470ft. and more, and it was decorated with every sort of precious substance, so that all who passed by and saw the exquisite beauty and graceful proportions of the tower and the temple attached to it, exclaimed in delight, "these are incomparable for beauty." Tradition says that this was the highest tower in *Jambudwipa*.[233] When the King had finished his tower, the little one, built by the shepherded boy, immediately came out it, and removed itself to the south of the great tower, its height was about 3ft. 6in.

Buddha's alms bowl is also preserved in this country. In former times a King of the Yu-tchi, having raised a great army of soldiers, came with them all to invade this country, desiring to carry off the alms bowl. When he had subdued the country, the King of the Yu-tchi, being a firm believer in the law of Buddha, wished to take the bowl and go. He, therefore, prepared to make religious offerings, and, having performed his vows to the three

sacred objects of worship, he caparisoned a great elephant, and placed the alms bowl upon its back. No sooner had he done so, than the elephant fell to the ground, and was unable to advance a step. He then caused a four-wheeled car to be constructed to convey the alms bowl, and eight elephants to be harnessed to it; but once more they were unable to advance. The King was then convinced that the destiny of the alms bowl (in that kingdom) was not yet completed, and, being deeply ashamed of himself, he forthwith raised a tower upon the spot, and also a *Sangharama*; moreover he delayed his own departure, and remained to guard the relic, and performed every kind of religious service in its honour.

CHAPTER XIII

Po Wan, Tsang King and Hwui Ta return home. Hwui King fell ill in Na-kie and To Ching stayed to care for him. Later, Hwui King went to the temple of Buddha's alms bowl and died soon after. Fah-Hian proceeded to the place of Buddha's skull bone:

Going westwards sixteen *yojanas*,[234] we arrive at the borders of the country of Na-kie (Nagrak). In the city of Hi-lo (Hidda) is the Vihara containing the relic of the skull-bone of Buddha.[235] This Vihara is entirely covered with plates of gold, and decorated with the seven precious substances.[236] The King of the country reverences, in a high degree, this sacred relic. For fear lest any man should carry off the true bone and substitute another in its place, therefore he appoints eight persons belonging to the principal families of the country to seal up (every night) the door of the shrine, each one with his own seal, so as to guard and protect it. At early dawn these eight men all go to the temple, and each one observes if his seal is as he left it. They then open the door, and having washed their hands with perfumed water, they take out the bone of Buddha, and place it upon a lofty throne which is erected outside the shrine. On this throne is a circular table composed of the seven precious substances, with a crystal bell-shaped cupola on the top. Both the table and the cover are highly decorated and enriched with gems. The bone is of a yellowish-white colour, about four inches square, and somewhat elevated in the middle. Each day after it is

thus removed, certain men appointed for the purpose ascend a lofty belfry and beat a great drum, blow the conch, and clash the cymbals. When the King hears it he immediately repairs to the Vihara and offers flowers and incense; having done this, he repeatedly bends his head to the ground in adoration and departs. He enters by the eastern gate and departs by the western one. Thus does the King discharge his religious duties every morning, and after worship he proceeds to attend to governmental affairs. The chief men and nobles also attend to these acts of worship first, and then to their household duties, this, in fact, is the first and unfailing duty of every day. After the acts of worship are over, they then return the relic to its shrine. In this Vihara is a Dagoba (small relic tower) ornamented with the seven precious substances, partly solid and partly hollow, and about five feet in height. In order to enable worshippers to present their offerings at this Dagoba there are men appointed to sell flowers and incense at the gate of the Vihara every morning, so that all those who desire to make religious offerings may purchase everything necessary for the purpose. All the neighbouring princes depute commissioners to present religious offerings in this chapel. The site of the chapel is a square of forty paces a side. Though the heavens should quake, and the earth open, this place would remain unmoved.

Buddha's tooth relic:

In this town also is a tower of Buddha's tooth-relic,[237] which is worshipped in the same way as the skull-bone. One *yojana* to the NE of this city we reach the entrance of a defile where is preserved Buddha's religious staff. A Vihara is erected in which religious offerings are made to it. The staff is made of sandal-wood, of the kind called *Gosirchandana*, and is about one chang and six or seven-tenths long (between 19 and 20 feet).[238] It is contained in a wooden tube case, from which no human power can remove it. Entering the defile and travelling westward for four days there is a Vihara erected for the purpose of paying religions reverence to Buddha's robe (*Sanghati*). When there is a drought in that country the chief personages of the kingdom assemble together, and taking out the robe of Buddha, they worship it and pay to it religious devotion. The heavens then yield abundance of rain.

CHAPTER XV

After crossing the Little Snowy Mountains, Hwui Ying fell ill and died. Fah-Hian and his companion proceeded to Afghanistan and after resting during the rains, arrived at Bannu. Travelling east, they re-crossed the Indus:

On the other side of the river is a country called Pi-cha (Bhida on the Jhelum). The Law of Buddha is prosperous and flourishing here, and is known both in connection with the Small and Great Vehicle. On seeing disciples from China among them they were much affected and spoke thus, "How wonderful to think that men from the ends of the earth, should know the character of this religion (that there is a system of religion requiring one to leave one's family), and should come thus far to seek the laws of Buddha." We received from them all that we required and were treated according to the provisions of the law.

CHAPTER XVI

At Mathura on the banks of the Jamuna:

On the banks of this river there are twenty *Sangharamas*, containing perhaps 3000 priests. The Law of Buddha is in a reviving condition. All the kingdoms beyond the sandy deserts are spoken of as belonging to western India. The kings of all these countries firmly believe in the Law of Buddha. When they pay their religious offerings to the priesthood, they uncover their heads. Both they and the members of their households and the ministers of state (frequently) conduct the priests to their several palaces, for the purpose of providing them with food. Having placed their entertainment before them, they spread a carpet on the ground opposite the lofty dens on which the priests sit, and there take their places in front of them, for in the presence of the priesthood it is not allowed (to laymen) to sit on a loftier seat. These rules for the conduct of princes when offering their religious devotions have been handed down by tradition from the time when Buddha was in the world to the present day.

Revenue and administration in Madya Desa; the social status of Chandalas:

To the south of this, the country is called Madya Desa (middle country). The climate of this region is exceedingly equable, there is neither frost nor snow. The inhabitants are prosperous and happy. There are no Boards of Population and Revenue. Those only who farm the Royal demesnes, pay a portion of the produce as rent. Nor are they bound to remain in possession longer than they like. The King in the administration of justice inflicts no corporal punishment, but each culprit is fined in money according to the gravity of his offences; and even in cases where the culprit has been guilty of repeated attempts to excite rebellion, they restrict themselves to cutting off his right hand. The chief officers of the king have all allotted revenues. The people of this country kill no living creature nor do they drink intoxicating liquors. And, with the exception of the Chandalas (a caste of hunters), they eat neither garlic or onions. The word "*chandala*" signifies a wicked man, who lives apart from others. If such a man enters a town or a market place, he strikes a piece of wood, in order to keep himself separate; people, hearing this sound, know what it means and avoid touching him or brushing against him. In this country they do not keep swine or fowls, they do not deal in living animals, nor are there shambles or wine shops round their markets. They use shells for money in their traffic. The Chandalas alone go to hunting and deal in flesh. From the time of Buddha's *Nirvana*, the kings and nobles of all these countries began to erect Viharas for the priesthood, and to endow them with lands, gardens, houses, and also men and oxen to cultivate them. The Records of these endowments, being engraved on sheets of copper, have been handed down from one king to another, so that no one has dared to deprive them of possession, and they continue to this day to enjoy their proper Revenues.

Status of priests and treatment of visiting monks:

All the resident priests have chambers, beds, coverlets, food, drink and clothes provided for them without stint or reserve. Thus it is in all places. The priests, on the other hand, continually employ themselves in work of benevolence, in reciting their Scriptures, or in profound meditation. When a strange priest arrives amongst them, the senior brethren go out to meet him,

and conduct him on his way, carrying for him his clothes and alms dish. They then present him with water to wash his feet and cleanse them from mire, and they prepare an extraordinary repast.[239] After a little pause, when the stranger has rested, they ask him his age, according to which they allot him a chamber with proper materials, in every respect as the Law directs. In every place where the priests take up their fixed abode (i.e., rainy season), they erect towers in honour of Sariputra, Mogalan, Ananda (Buddha's disciples), and also towers in honour of the *Abhidharma*, *Vinaya*, and *Sutra Pitakas*. After the first month of residence the principal religious families in the neighbourhood exhort them to commence their Religious Services. On this, the priests partake of an extraordinary collation, and being assembled in a great congregation they repeat the Law; this being over, they present religious offerings to the tower of Sariputra, every kind of incense and flowers, and throughout the whole night they burn lamps provided by those men for the purpose. Sariputra was originally a Brahman. On one occasion having met Buddha, he sought to become a disciple. So also did the great Kasyapa[240] and the great Mogalan. The *Bikshunis* principally affect the worship of the tower of Ananda, because it was Ananda who requested Buddha to permit females to become disciples. The *Samaneras* principally affect the worship of Rahula (Buddha's son). The professors of the *Abhidharma* pay their religious offerings to that work, and so also with the masters of the *Vinaya*. Every year there is one such religious service, each individual having his own day. Men who belong to the Great Vehicle worship the *Prajna Paramita*,[241] Manjusri,[242] and Avalokiteswara (*Bodhisatwa*). The Priests' harvest being finished (the season when priests receive presents), then the nobles, and householders, and Brahmans, all provide themselves with different sorts of material for making garments such as priests require and present them to the clergy. The priests likewise make presents one to another. These rules of courtesy for the direction of the holy Congregation have been handed down without interruption from the time of Buddha's *Nirvana* till now.

CHAPTER XVII

From Mathura to Sankasya; Buddha's ascent to *Triyastrinshas* heaven and return to earth:

Going SE from this place (i.e. Mathura) eighteen *yojanas*, there is a kingdom called Sang-ka-shi (Sankasya).[243] When Buddha went up to the *Triyastrinshas* heaven to say Bana (preach the Law) for the sake of his mother,[244] after three months he descended at this place. On this occasion he exerted his spiritual power so that his disciples did not know where he had gone. Seven days before the completion of the three months, he again scattered his spiritual influence, so that Aniruddha (his cousin) by his divine sight was able to behold the World-Honoured one afar off. Immediately he addressed the venerable Maha Mogalan, "You now can go and pay reverence to the World-Honoured one." Mogalan forthwith proceeded and prostrated himself in adoration of the marks on the foot of Buddha.[245] This act of adoration being over, Buddha addressed him and said, "After seven days more I shall descend to *Jambudvipa*." Then Mogalan returned. At the appointed time the *maharajas* of the eight kingdoms and all the ministers and people, not having seen Buddha for so long, greatly desired to meet him. They flocked therefore in great crowds to this country to await the return of the World-Honoured One. Then the *Bikshuni* Utpala began to think thus with herself, "Today the king, ministers, and people are all going to meet Buddha and render homage to him, but I – a woman – how can I contrive to get the first sight of him." Buddha immediately, by his divine power, changed her into a holy *Chakravartti*[246] *Raja*, and in that capacity she was the very first to reverence Buddha on his return.

The descent of Buddha:

Buddha was now about to descend from the *Triyastrinshas* heavens. At this time there appeared a threefold precious ladder. Buddha standing above the middle ladder which was made of the seven precious substances began to descend. Then the king of the *Brahmakayikas*[247] caused a silver ladder to appear, and took his place on the right hand, holding a white *chowry* in his hand. Whilst the divine Sekra caused a bright golden ladder to appear, and took his place on the left hand holding a precious parasol in his hand.

Innumerable *Devas* were in attendance whilst Buddha descended. After he had accomplished his return the three ladders all disappeared in the earth except seven steps, which still continued to be visible.

Asoka investigates the ladders:

In after times king Asoka, wishing to find out the utmost depth to which these ladders went, employed men to dig and examine the matter. They went down till they came to a spring of yellow water, but yet had not arrived at the bottom. The king deriving from this an increase of faith and reverence, forthwith built over the ladders a Vihara, and in the middle of it placed a standing figure (of Buddha) sixteen feet high. Behind the Vihara he erected a stone pillar thirty cubits high, and on the top placed the figure of a Lion.[248] Within the pillar on the four sides are placed figures of Buddha; both within and without it is shining and bright as glass (lapis lazuli). It happened once that some heretical Doctors had a contention with the Shamans respecting this, as a place of residence. Then the Shamans agreed to any condition for settling the question that might be considered reasonable. On which they all bound themselves to this compact, "If this place properly belongs to the Shamans, then there will be some supernatural proof given of it." Immediately on this, the lion on the top of the pillar uttered a great roar. Witnessing this testimony, the unbelievers, abashed, withdrew from the dispute and submitted.

CHAPTER XX

Fah-Hian passes through Kanauj, Kasi, and reaches Kosala:

Going eight *yojanas* southwards[249] from this place, we arrive at the country of Kiu-sa-lo (Kosala[250]) and its chief town She-wei (Sravasti).[251] There are very few inhabitants in this city, altogether perhaps about two hundred families. This is the city which king Prasenajit governed. Towers have been erected in after times on the site of the ruined Vihara of Maha Prajapati,[252] also on the foundations (of the house) of Sudatta[253] the Nobleman, also on the spot where the Angoulimalya was burnt who was converted and entered Nirvana; all these Towers are erected in the midst of

the city. The unbelieving Brahmans, entertaining a jealous feeling, desired to destroy these various edifices, but on their attempting to do so the heavens thundered and the lightnings flashed, so that they were unable to carry their design into execution.

Jetavana Vihara and the image of the Buddha:

Leaving the city by the south gate, and proceeding twelve hundred paces on the road, on the west side of it is the place where the nobleman Sudatta built a Vihara (*Jetavana*). This chapel opens towards the East. The principal door is flanked by two side chambers, in front of which stand two stone pillars, on the top of the left hand one is the figure of a wheel, and on the right hand one, the image of an ox.[254] The clean water of the tanks, the luxuriant groves, and numberless flowers of variegated hues, combine to produce the picture of what is called the Vihara of Chi-un (Jeta). When Buddha ascended into the *Triyastrinshas* heavens to repeat the Law for the sake of his mother, after ninety days absence, king Prasenajit desiring to see him again, carved out of the sandal wood called Gosirchandana an image of the saint and placed it on the seat that he usually occupied. When Buddha returned and entered the Vihara, the image immediately quitting its place, went forward to meet him. On this Buddha addressed these words to it, "Return I pray you to your seat. After my *Nirvana* you will be the model from which all my flowers (members of the four schools or classes) shall carve their images of me." On this the Figure immediately returned to its seat. This image, as it was the very first made of all the figures of Buddha, is the one which all subsequent ages have followed as a model. Buddha subsequently removed and dwelt in a small Vihara on the south side of the greater one, in a place quite separate from that occupied by the image, and about twenty paces from it.

Fire in Jetavana Vihara; restoration by the faithful:

The Chi-un Vihara originally had seven storeys. The monarchs of all the surrounding countries and their inhabitants vied with each other in presenting religious offerings at this spot. They decked the place with flags and silken canopies, they offered flowers and burnt incense, whilst the lamps shone out day after day with unfading splendour. Unfortunately, a rat

gnawing at the wick of one of the lamps caused it to set fire to one of the hanging canopies, and this resulted in a general conflagration, and the entire destruction of the seven storeys of the Vihara. The kings and people of the surrounding countries were all deeply grieved, supposing that the sandal wood figure had also been consumed. Four or five days afterwards, on opening the door of the eastern little chapel, they were surprised to behold the original figure there. All the people were filled with joy, and they agreed to re-build the chapel. Having completed two storeys they removed the image from its new situation back to where it was before. When Fah Hian and To Ching arrived at this chapel of Chi-un, they were much affected to think that this was the spot in which Buddha had passed twenty-five years of his life.

Buddhist priests express surprise to meet the Chinese pilgrims at Jetavana:

Whereupon the priests, belonging to that community, came forward and addressed Fah Hian and his companion thus, "From what country have you come?" To which they replied, "We come from the land of Han." Then those priests, in astonishment, exclaimed, "Wonderful! To think that men from the remotest corner of the earth should come so far as this, from a desire to search for the Law;" and then talking between themselves they said, "Our various Superiors and Brethren who have succeeded one another in this place, the earliest time till now, have none of them seen men of Han come so far as this before."

Five hundred blind men recover their sight after hearing Buddha:

Four *li* to the N.W. of the Vihara is a copse called "Recovered Sight" (*Aptanetravana*, Jul. ii.308). Originally there were five hundred blind men dwelling on this spot, who were in the habit of attending the Chapel. On one occasion Buddha declared the Law on their account, after listening to his sermon, they immediately recovered their sight. The blind men, overcome with joy, drove their staves into the earth and fell down on their faces in adoration. The staves forthwith took root and grew up to be great trees. The people, from a feeling of reference, did not presume to cut them down, and so they grew and formed a grove to which this name of

"Recovered Sight" was given. The priests of the chapel of Chi-un resort in great numbers to this shady copse to meditate after their midday meal.

Brahmins fail to defame Buddha:

The great Garden enclosure of the Vihara of Chi-un has two gates, one opening towards the East, the other towards the North. This garden is the plot of ground which the noblemen Sudatta bought, after covering it with gold coins. The chapel is placed in the exact centre of it; it was here Buddha resided for a very long time and expounded the Law for the Salvation of men. Towers have been erected on the various spots where he walked for exercise or sat down. These towers have all distinctive titles given them, as for example, the place where Buddha formerly held a discussion with the followers of the ninety-six heretical schools. The king of the country, the chief ministers, the landowners and people all came in great numbers to hear him. At this time a woman, who was an unbeliever, called Chinchimana, being filled with jealousy, gathered up her clothes in a heap round her person so as to appear big with child, and then accused Buddha, in the midst of the great assembly, of having acted towards her contrary to the Law. On this, Sekra, the heavenly king, taking the appearance of a white mouse, came and gnawed through the sash which bound the woman's clothes up in the heap; on this the whole fell down, and then the earth opened and she herself went down alive into Hell.

Destruction of the Sakyas:

Four *li* to the SE of Sravasti is the place where the World-Honoured One stood by the side of the road when king Viroudhaka (Leou-li)[255] wished to destroy the country of the Sakya family; on this spot there is a tower built. Fifty *li* to the west of the city we arrive at a town called To-wai,[256] this was the original birthplace of Kasyapa Buddha. Towers are erected on the spot where he had an interview with his father and also where he entered *Nirvana*. A great tower has also been erected over the relics of the entire body of Kasyapa Tathagata.

CHAPTER XXII

Birthplace of the Buddha deserted:

From this spot going eastward less than a *yojana* we arrive at the city of Ka-wei-lo-wei (Kapilavastu).[257] In this city there is no government or people, it is just like a great desert. There is simply a congregation of priests and about ten families of lay people. In the place where stand the ruins of the palace of Sudhodana (Buddha's father), there is a picture of the Prince-apparent and his mother, (supposedly) taken at the time of his miraculous conception.[258] The Prince is represented as descending towards his mother, riding on a white elephant. Towers have been erected on the following spots – where the royal Prince left the city by the Eastern gate,[259] where he saw the sick man, and where he caused his chariot to turn and take him back to his Palace. There are also towers erected on the following spots – at the place where the (Rishi) Asita calculated the horoscope of the royal Prince; where Nanda[260] and the others struck the elephant and seized it; where the arrow[261] going south-east thirty *li* entered the earth, from which bubbled up a fountain of water, which, in after generations, was used as a well for travellers to drink at; also on the spot where Buddha, after arriving at Supreme Wisdom, met his father; where the five hundred Sakyas having embraced the faith, paid reverence to Upali; at the place where the earth shook six times in succession; at the place where Buddha expounded the Law on behalf of all the Devas, whilst the four Heavenly Kings guarded the four gates of the hall, so that his father could not enter; at the place where Maha Prajapatî presented Buddha with a Sanghati whilst he was sitting under a Nyagrodha tree, with his face to the East, which tree still exists; at the place where Viroudhaka Raja killed the offspring of the Sakyas,[262] who had previously entered on the path Srotapanna. All these towers are still in existence.

Buddha's birth place – Lumbini:

Fifty *li* to the east of the city is the royal garden, called Lumbini; it was here the Queen entered the bath to wash herself, and having come out on the northern side, advanced twenty paces, and then holding a branch of the (*Sala*) tree in her hand, brought forth the Prince. When born he walked

seven steps; two dragon Kings washed the Prince's body, - the place where this occurred was afterwards converted into a well, from which the priests draw their drinking water. All the Buddhas have four places universally determined for them: 1. The place for arriving at Supreme Wisdom; 2. The place for turning the wheel of the Law; 3. The place for expounding the true principles of the Law, and refuting the heretics; 4. The place for descending to earth after going into the *Triyastrinshas* heaven to explain the Law to their mothers.

CHAPTER XXIII

In Ramagrama:[263]

The King of this country obtained one share of the Relics of Buddha's body.[264] On his return home he built a tower (over the relics), which is the same as the Tower of Ramagrama. By the side of it is a tank in the middle of which resides a Dragon, who constantly guards and protects the tower, and performs religious service in it, morning and night. When King Asoka was born (and came to the throne), he wished to destroy the eight towers and to build eighty-four thousand others (throughout the land). Having destroyed seven of them, he next proceeded to treat this one in the same way. The Dragon therefore assumed a body, and conducted the King within his abode, and having exhibited to him all the vessels and appliances he used in his religious services, he addressed the King, and said: "If you can excel me in these particulars, then you may destroy the tower, go and do so at once, I will have no quarrel with you." King Asoka knowing that these vessels were of no human workmanship, immediately returned to his home.

CHAPTER XXIV

Passing through the place where Buddha directed his charioteer Chandaka and horse Kanika to return to the palace, Fah-Hian arrives at Kusinagara:

Proceeding eastward from this place four *yojanas* we arrive at the tower raised over the ashes selected after the burning of Buddha's body. Here also is a *Sangharama*. Again advancing twelve *yojanas* to the eastward we

arrive at the town of Kusinagara. To the north of this town, on the place where the world-honoured Buddha, lying by the side of the Hiranyavatî (Little Gandak) River, with his head to the North, and a Sal tree on either side of him, entered *Nirvana*. Also in the place where Subhadra (an 81-year old Brahmin) was converted, the very last of all his disciples. Also where, for seven days, they paid reverence to the world-honoured Buddha, lying in his golden coffin. Also where Vajrapani threw down his golden mace, and where the eight kings divided the relics; in each of the above places towers have been raised and *Sangharamas* built, which still exist.

CHAPTER XXV

Passing through the site where the Litchavas[265] were prevented from following Buddha to the place of his Nirvana, Fah-Hian arrives at Vaisali:

To the north of the city of this name there is the Vihara of the great forest (Mahavana Vihara) which has a double tower (two storeys). This chapel was once occupied by Buddha.[266] Here also is the tower which was built over half the body of Ananda. Within this city dwelt Amradarika (courtesan Ambapalli) who built a tower in honour of Buddha, the ruins of which still exist. Three *li* to the south of the city, on the west side of the road, is the garden which Amradarika presented to Buddha as a place for him to rest in. When Buddha was about to enter Nirvana, accompanied by his disciples, he left Vaisali by the western gate, and turning his body to the right as a token of respect (*pradakshana*) he beheld the city and thus addressed his followers:- "In this place I have performed the last religious act of my earthly career." Men afterwards raised a Tower on this spot.

Legend of the thousand Buddhas:

Three li to the north-west of the city is a tower called "the tower of the deposited bows and clubs." The origin of this name was as follows:- On one of the superior affluents of the river Ganges there was a certain country ruled by a king. One of the concubines of this monarch gave birth to an unformed fœtus, whereupon the wife of the king, being filled with jealousy,

said, “Your conception is one of very bad omen.” So they immediately closed it up in a box of wood and cast it into the middle of the Ganges. Lower down the stream there was a certain Rajah, who, as he was taking a tour of observation, caught sight of the wooden box as it floated on the surface of the stream. On bringing it to the shore and opening it, to see what was inside, he beheld a thousand little children very fair and just of a size. The king hereupon took them and brought them up. Afterwards, when they grew up, they turned out to be very brave and warlike, and were victorious over all whom they went to attack. In process of time they marched against the kingdom of the monarch, their father. The king was filled with great consternation in anticipation of their approach. On this his concubine asked the Rajah why he was so terrified, to which he replied, “The king of that country has a thousand sons, brave and warlike beyond compare, and these are coming to waste my territories, this is why I am alarmed.” To this the concubine replied, “Fear not! But erect on the east of the city a high tower, and when the robbers come, place me on the top of it, and I will restrain them.” The king did as she requested, and when the invaders arrived the concubine, from the top of the tower, addressed them, saying, “Are you my children all? Then why are you engaged in such rebellious acts as these?” They replied, “Who are you, that say you are our mother?” The concubine replied, “If ye will not believe me, all of you look up towards me, and open your mouths.” On this the concubine, with both her hands, compressed her breasts, and from each breast forthwith proceeded five hundred jets of milk, which fell into the mouths of her thousands sons. On this the robbers, perceiving that she was indeed their mother, immediately laid down their bows and clubs. The two royal fathers, by a consideration of these circumstances, were able to arrive at the condition of Pratyeka Buddhas, and two towers, erected in their honour, remain to the present day. In after times, when the world-honoured Buddha arrived at Supreme Reason, he addressed all his disciples in these words, and said, “This is the place where I formerly laid aside my bow and my club.” Men in after times, coming to know this, founded a Tower in this place, and hence the name given to it. The thousand young children are in truth the thousand Buddhas of this Bhadra Kalpa. Buddha, when standing beside this tower, addressed Ananda in these words, “After three months I must enter *Nirvana*,” on which

occasion Mara Raja so fascinated the mind of Ananda that he did not request Buddha to remain in the world.

CHAPTER XXVI

Nirvana of Ananda:

When Ananda was going from the country of Magadha towards Vaisali, desiring to enter *Nirvana*, all the *Devas* acquainted king Ajasat[267] of it. The king immediately placed himself at the head of his troops, set out after him and arrived at the banks of the river. All the Litchhavas of Vaisali, hearing that Ananda was coming, likewise set out to meet him and arrived at the side of the river. Ananda then reflected that if he were to advance, king Ajasat would be much grieved, and if he should go back, then the Litchhavas would be indignant. Being perplexed he forthwith entered the *Samadhi* called the "brilliancy of flame," consuming his body, and entered *Nirvana* in the very midst of the river. His body was divided into two parts, one part was found on either side of the river, so the two kings, each taking the relics of half his body, returned and erected towers over them.

CHAPTER XXVII

In Magadha (Patna), Asoka makes a hill to lure his brother from Gridhrakuta (Vulture's Peak):

The king, having a great regard and reverence for his brother,[268] requested him to come to his house to receive his religious offerings. His brother, pleased with his tranquillity in the mountain, declined the invitation. The king then addressed his brother, saying, "If you will only accept my invitation, I will make for you a hill within the city." The king then, providing all sorts of meat and drink, invited the Genii to come, addressing them thus, "I beg you all to accept my invitation for tomorrow, but as there are no seats (fit for you), I must request you each to bring his own." On the morrow all the great Genii came, each one bringing with him a great stone, four or five paces square. Immediately after the feast, he deputed the Genii to pile up the great stones and make a mountain of them, and at the base of the mountain with five great square stones to make a Rock chamber, in

length about thirty-five feet and in breadth twenty-two feet, and in height eleven feet or so.

Buddha Ghosa's eminence:

In this city (Patna) once lived a certain Brahman[269] called Lo-tai-sz-pi-mi, of large mind and extensive knowledge, and attached to the Great Vehicle. There was nothing with which he was unacquainted, and he lived apart occupied in silent meditation. The King of the country honoured and respected him, as his religious superior (Guru). If he went to salute him he did not dare to sit down in his presence. If the king from a feeling of affectionate esteem took him by the hand, the Brahman immediately washed himself from head to foot. For something like fifty years the whole country looked up to this man and placed its confidence on him alone. He mightily extended the influence of the Law of Buddha, so that the heretics were unable to obtain any advantage at all over the priesthood.

The procession of Images in Patna:

Of all the kingdoms of mid-India, the towns of this country are especially large. The people are rich and prosperous and virtuous. Every year on the eighth day of the second month there is a procession of Images. On this occasion, they construct a four-wheeled car, and erect upon it a tower of five stages, composed of bamboos lashed together, the whole being supported by a centre post resembling a large spear with three points, in height twenty-two feet and more. So it resembles a Pagoda. They then cover it over with fine white linen, on which they afterwards paint all sorts of gaily-coloured pictures. Having made figures of all the *Devas*, and decorated them with gold, silver, and coloured glass (lapis lazuli), they place them under canopies of embroidered silk. Then at the four corners (of the car) they construct niches (shrines) in which they place figures of Buddha, in a sitting posture, with a *Bodhisatwa* standing in attendance. There are perhaps twenty cars thus prepared, and decorated each one differently from the rest. During the day of the procession, both priests and laymen assemble in great numbers. There are all sorts of games and amusements (for the latter), whilst the former offer flowers and incense in religious worship. The *Bramacharis* (disciples of Brahmans) come forth to

salute Buddha, and one after the other the cars enter the city. After coming into the town they take up their several positions. Then all night long the people burn lamps,[270] indulge in games, and make religious offerings. Such is the custom of all those who assemble on this occasion from the different countries round about.

The founding of hospitals and shelters:

The respective nobles and landowners of this country have founded hospitals within the city, to which the poor of all countries, the destitute, cripples, and the diseased, may repair (for shelter). They receive every kind of requisite help gratuitously. Physicians inspect their diseases, and according to their cases order them food and drink, medicine or decoctions, every thing in fact that may contribute to their ease. When cured they depart at their own convenience.

CHAPTER XXVIII

Indra (Sekra) questions Buddha:

From this city, proceeding in a south-easterly direction nine *yojanas*, we arrive at a small rocky hill[271] standing by itself, on the top of which is a stone cell facing the south. On one occasion, when Buddha was sitting in the middle of this cell, the Divine Sekra took with him his attendant musicians, each one provided with a five stringed lute, and caused them to sound a strain in the place where Buddha was seated. Then the divine Sekra proposed forty-two questions to Buddha, writing each one of them singly with his finger upon a stone. The traces of these questions yet exist. There is also a *Sangharama*[272] built upon this spot.

Sariputra's *Nirvana*:

Going south-west from this one yojana we arrive at the village of Na-lo (Nalandagram). This was the place of Sariputra's birth. Sariputra returned here to enter *Nirvana*. A tower therefore was erected on this spot, which is still in existence.

CHAPTER XXIX

From New Rajagriha, the pilgrims reach the Vulture's Peak, where Mara had tried to frighten Ananda:

Three *li* from the top is a stone cavern facing the south. Buddha used in this place to sit in profound meditation (*dhyana*). Thirty paces to the north-west is another stone cell, in which Ananda practiced meditation. The *Deva Mara Papiyan* (wicked one) having assumed the form of a vulture, took his station before the carvern, and terrified Ananda. Buddha, by his spiritual power penetrated the rock, and with his outspread hand touched the head of Ananda. On this he bore up against his fear, and found peace. The traces of the bird and of the hand-hole still plainly exist, and from this circumstance the hill is called "the hill of the vulture cave" (*Gridhrakuta*).

Fah-Hian meditates in the hall where Buddha delivered his most celebrated discourses:

The hall in which Buddha delivered the law has been overturned and destroyed; the foundations of the brick walls still exist however. The peaks of this mountain are picturesque and imposing; it is the loftiest one of the five mountains that surround the town. Fah-Hian having bought flowers, incense, and oil and lamps, in the New Town procured the assistance of two aged *Bikshus* to accompany him to the top of the peak. Having arrived there, he offered his flowers and incense, and lit his lamps, so that their combined lustre illuminated the gloom of the cave. Fah Hian was deeply moved, even till the tears coursed down his cheeks, and he said, "Here it was in bygone days Buddha dwelt, and delivered the *Surangama Sutra*. Fah Hian, not privileged to be born at a time when Buddha lived, can but gaze on the traces of his presence, and the place which he occupied." Then taking his position in front of the cave, he recited the *Surangama* (*Sutra*), and remained there the entire night.

CHAPTER XXX

Traversing the Bamboo Garden of Nalanda and other places, the pilgrims arrive at Sattapanni Cave where the first great Convocation

was held:

This is the place where 500 *Rahats* assembled after the *Nirvana* of Buddha to arrange the collection of sacred books. At the time when the books were recited, three vacant seats where specially prepared and adorned. The one on the left was for Sariputra, the one on the right for Maudgalyayana. The assembly was yet short of 500 by one *Rahat*; and already the great Kasyapa was ascending the throne, when Ananda stood without the gate unable to find admission;[273] on this spot they have raised a tower, which still exists.

CHAPTER XXXI

In Gaya and neighbouring sites:

All within this city likewise is desolate and desert. Going south twenty *li*, we arrive at the place where *Bodhisatwa*, when alive, passed six years in self-inflicted austerities. This place is well wooded. From this spot, proceeding westward three *li*, we arrive at the spot where Buddha, entering the water to bathe himself, the *Deva* held out the branch of a tree to him to assist him in coming out of the water. Again, going north two *li*, we arrive at the place where the village girls[274] gave the milk and rice to Buddha. From this, going north two *li*, is the spot where Buddha, seated on a stone under a great tree, and looking towards the east, ate the rice and milk. Both the tree and the stone remain to the present day. The stone is about six feet square, and two in height.

Buddha seeks a divine sign and fights the forces of Mara:

Going north-east from this half a *yojana*, we arrive at a stone cell, into which *Bodhisatwa* entering sat down with his legs crossed, and his face toward the west. Whilst thus seated, he reflected with himself: “If I am to arrive at the condition of perfect wisdom, then let there be some spiritual manifestation.” Immediately on the stone wall there appeared the shadow of Buddha, in length somewhat about three feet. This shadow is still distinctly visible. Then the heavens and the earth were greatly shaken, so much so that all the *Devas* resident in space cried out and said, “This is not the place

appointed for the Buddhas (past or those to come) to arrive at Perfect Wisdom; at a distance less than half a *yojana* south-west from this, beneath the Pei-to tree, is the spot where all the Buddhas (past or yet to come) should arrive at that condition." The *Devas* having thus spoken immediately went before him, singing and leading the way with a view to induce him to follow. Then *Bodhisatwa*, rising up, advanced after them. When distant thirty paces from the tree, the *Devas* presented to him the grass mat of Ki-tseung (Santi).[275] Bodhisatwa, having accepted it, again advanced fifteen paces. Then 500 blue birds came flying towards him,[276] and having encircled Bodhisatwa three times in their flight, departed. Bodhisatwa, then going forward, arrived under the Pei-to tree, and spreading out the mat of Santi, sat down upon it, with his face towards the east. Then it was that Mara Raja dispatched three pleasure girls[277] from the northern quarter to come and tempt him, whilst Mara himself coming from the south, assailed him likewise. Then Bodhisatwa striking the toe of his foot against the earth, the whole army of Mara was scattered, and the three women were changed into hags.

Buddha attains the supreme knowledge:

Buddha having arrived at Supreme Wisdom for seven days sat contemplating the Tree, experiencing the joys of emancipation. On this spot they have raised a tower, as well as on the following, viz. where he walked for seven days under the Pei-to tree, from east to west; where all the *Devas*, having caused the appearance of a hall composed of the seven precious substances for seven days paid religious worship to Buddha; where the blind dragon Manlun (*Mouchalinda*, *Lalita Vistara* 355) for seven days encircled Buddha in token of respect; also where Buddha seated on a square stone beneath a *Nyagrodha* tree, and with his face to the east, received the respectful salutation of Brahma; also where the four Heavenly Kings respectfully offered him his alms bowl; also where the 500 merchants presented him with wheat and honey; also where he converted the Kasyapas, elder and younger brothers, each of whom was at the head of 1,000 disciples. In the place where Buddha arrived at perfect[278] reason, there are three *Sangharamas*, in all of which priests are located. All the

ecclesiastics are supplied with necessaries by the people, so that they have sufficient and lack nothing. They scrupulously observe the rules of the *Vinaya* with respect of decorum. They exactly conform to the regulations established by Buddha when he was in the world, which relate to sitting down, rising up, or entering the assembly; and they have ever done so from the first till now. The sites of the four great Pagodas have always been associated together from the time of the *Nirvana*. The four great Pagodas are those erected on the place where he was born, where he obtained emancipation, where he began to preach, and where he entered *Nirvana*.

CHAPTER XXXII

Asoka is blessed by Sakya Muni:

Formerly, when King Asoka was a lad, when he was playing on the road, he encountered[279] Sakya Buddha going begging. The little boy, rejoiced to have the opportunity, immediately presented him with a handful of earth as an offering. Buddha received it, and on his return sprinkled it on the ground on which he took his exercise. In return for this act of charity the lad became an iron-wheel king, and ruled over *Jambudwipa*. On assuming the iron wheel (becoming a universal monarch) he was on a certain occasion going through *Jambudwipa* in the administration of justice, at which time he saw one of the places of torment[280] for the punishment of wicked men, situated between two mountains, and surrounded by an iron wall. He immediately asked his attendant ministers, "What is this place?" To this they replied and said, "This is the place where Jemma, the infernal king, inflicts punishment on wicked men for their crimes." The king then began to reflect and said, "The Demon King, in the exercise of his function, requires to have a place of punishment for wicked men. Why should not I, who rule these men (on earth), have a place of punishment likewise for the guilty?"

Asoka creates his own hell:

On this he asked his ministers, "Who is there that I can appoint to make for me a Hell, and to exercise authority therein for the punishment of

wicked men?" In reply they said, "None but a very wicked man can fulfill such an office." The king forthwith dispatched his ministers to go in every direction to seek for such a man. In the course of their search they saw, by the side of a running stream, a lusty great fellow of a black colour, with red hair and light eyes, with feet like talons, and a mouth like that of a fish. When he whistled to the birds and beasts they came to him, and when they approached he mercilessly shot them through, so that none escaped. Having caught this man, he was brought before the king. The king then gave him these secret orders, "You must enclose a square space with high walls, and within this enclosure plant every kind of flower and fruit (tree), and make beautiful lakes and alcoves, and arrange everything with such taste as to cause men to be anxious to look within the enclosure. Then, having made a wide gate, the moment a man enters within the precincts, seize him at once, and subject him to every kind of infernal torture. And whatever you do, let no one (who has once entered) ever go out again. And I strictly enjoin you, that if I even should enter the enclosure, that you torture me also and spare not. Now then, I appoint and constitute you Lord of this place of Torment!" It happened that a certain *Bikshu*, as he was going his rounds begging for food, entered the gate. The Infernal Keeper seeing him, (seized his person) and made preparations to put him to torture. The *Bikshu*, being very much frightened, suppliantly begged for a moment's respite, that he might, at least, partake of his mid-day meal. It so happened that just at this moment another man entered the place, on which the keeper directly seized him, and, putting him in a stone mortar, began to pound his body to atoms, till a red froth formed on the surface of the mass. The *Bikshu* having witnessed this spectacle, began to reflect on the impermanency, the sorrow, the vanity of bodily existence, that it is like a bubble and froth of the sea, and so he arrived at the condition of a Rahat. This having transpired, the Infernal Keeper laid hold of him and thrust him into a cauldron of boiling water. The heart of the *Bikshu* and his countenance were full of joy. The fire was extinguished and the water became cold, whilst in the middle of it there sprung up a Lotus, on the top of which the *Bikshu* took his seat. The keeper (on witnessing this) forthwith proceeded to the king and said, "A wonderful miracle has occurred in the place of Torture – would that your Majesty would come and see it." The king said, "I dare not come, in consideration of my former agreement with you." The keeper replied, "This matter is one of

great moment: it is only right you should come; let us consider your former agreement changed." The king then directly followed him and entered the prison; on which the *Bikshu*, for his sake, delivered a religious discourse, so that the king believed and was converted.[281] Then he ordered the place of Torture to be destroyed, and repented of all the evil he had formerly committed.

Asoka's queen cuts down the Bodhi tree:

From the time of his conversion he exceedingly honoured the three sacred symbols of his faith (*Buddha*, *Dharma*, *Sangha*), and went continually to the spot underneath the Pei-to Tree for the purpose of repentance, self-examination, and fasting. In consequence of this, the queen on one occasion asked, "Where is it the king is perpetually going?" on which the ministers replied, "He continually resides under the Pei-to Tree." The queen hereupon, awaiting an opportunity when the king was not there, sent men to cut the tree down. The king, repairing as usual to the spot, and seeing what had happened, was so overpowered with grief that he fell down senseless on the ground. The ministers, bathing his face with water, after a long time restored him to consciousness. Then the king piled up the earth on the four sides of the stump of the tree, and commanded the roots to be moistened with a hundred pitchers of milk. Then, prostrating himself at full length on the ground, he made the following vow: "If the tree does not revive, I will never rise up again." No sooner had he done this than the tree immediately began to force up small branches from the root, and so it continued to grow until it arrived at its present height, which is somewhat less than 120 feet.

CHAPTER XXXIV

Fah-Hian visits *Kukutapadagiri* (Cock's-foot) mountain and other sites linked with Kasyapa and Sakya Buddha:

Fah Hian returning towards Pataliputra kept along the course of the Ganges, and after going ten *yojanas* in a westerly direction arrived at a Vihara[282] called "Desert" (Kwang ye) in which Buddha resided. Priests still reside in it. Still keeping along the course of the Ganges, and going west

twelve *yojanas*, we arrive at the country of Kasi and the city of Benares (Po-lo-nai). About ten *li* or so to the NE of this city is the chapel of the Deer Park of the *Rishis* (Buddha gave his first sermon here). This garden was once occupied by a Pratyeka Buddha. There are always wild deer reposing in it for shelter. When the world-honoured Buddha was about to arrive at Supreme Wisdom, all the *Devas* who resided in space began to chant a hymn and say: "The son of Sudhodana Raja, who has left his home that he may acquire supreme wisdom, after seven days will arrive at the condition of Buddha." The Pratyeka Buddha, hearing this, immediately entered *Nirvana*. Therefore, the name of this place is the Deer Park of the Rishi. The world-honoured Buddha having arrived at complete knowledge, men in after-ages erected a Vihara on this spot.

Buddha's first disciples:

Buddha being desirous to convert Adjnata Kaundinya[283] (Keou lun) and his companions, known as the five men, they communised one with another and said: "This Shaman Gotama, having in his own person for six years practiced the severest mortifications, reducing himself to the daily use of but one grain of millet and one of rice, and in spite of this, having failed to obtain Supreme Wisdom, how much less shall he now obtain that condition, by entering into men's society and removing the checks he placed upon his words and thoughts and actions; today when he comes here, let us carefully avoid all conversation with him." On Buddha's arrival the five men rose and saluted him, and here they have erected a tower – also on the following spots, viz. on a site sixty paces to the north of the former place, where Buddha, seated with his face to the east, began to turn the Wheel of the Law (to preach) for the purpose of converting Kaundinya and his companions, commonly known as "the five men," also on a spot twenty paces to the north of this, where Buddha delivered his prediction concerning Maitreya, also on a spot fifty paces to the south of this, where the Dragon Elapatra asked Buddha at what time he should be delivered from his Dragon-form; in all these places towers have been erected which still exist. In the midst (of the Park) there are two *Sangharamas* which still have priests dwelling in them.

CHAPTER XXXV

Fah-Hian arrives in Ellora:

Going two hundred *yojanas* south from this, there is a country called Ta-Thsin (*Dakshina*, Deccan). Here is a *Sangharama* of the former Buddha Kasyapa (Ellora caves). It is constructed out of a great mountain of rock, hewn to the proper shape. This building has altogether five storeys. The lowest is shaped into the form of an elephant, and has five hundred stone cells in it. The second is in the form of a lion and has four hundred chambers. The third is shaped like a horse and has three hundred chambers. The fourth is in the form of an ox and has two hundred chambers. The fifth storey is in the shape of a dove and has one hundred chambers in it. At the very top of all is a spring of water which flowing in a stream before the rooms, encircles each tier, and so, running in a circuitous course, at last arrives at the very lowest storey of all, where, flowing past the chambers as before, it finally issues through the door of the building. Throughout the consecutive tiers, in various parts of the building, windows have been pierced through the solid rock for the admission of light, so that every chamber is quite illuminated and there is no darkness (throughout the whole). At the four corners of this edifice they have hewn out the rock into steps, as means for ascending. Men of the present time point out a small ladder which reaches up to the highest point (of the rock) by which men of old ascended it, one foot at a time. They derive the name which they give to this building, viz. Po-lo-yu, from an Indian word signifying "pigeon." There are always *Rahats* abiding here. This land is hilly and barren and without inhabitants. At a considerable distance from the hill there are villages, but all of them are inhabited by heretics.

CHAPTER XXXVI

Fah-Hian avoids the dangerous Deccan roads and returns to Patna; procures some scriptures:

From Benares going eastward in a retrograde order, we arrive at the town of Pataliputra again. The purpose of Fah Hian was to seek for copies of the *Vinaya Pitaka*. But throughout the whole of Northern India the various

masters trusted to tradition only for their knowledge of the Precepts, and had no written copies[284] of them at all. Wherefore Fah Hian had come even so far as Mid India (without success). But here in the *Sangharama* of the Great Vehicle (at Patna) he obtained one copy of the Precepts, viz. the collection used by the school of the *Mahasangikas*, which was that used by the first great assembly of priests convened during Buddha's lifetime. In the chapel of Chi-un (Jetavana) there is a tradition that this was originally their copy (or, this school originally sprang from them). The eighteen sects in general have each their own Superior, but they are agreed in their dependence on the Great Refuge (*Buddha*, *Dharma*, *Sangha*). In some minor details of faith they differ, as well as in a more or less exact attention to some matters of practice. But this collection is generally regarded as most correct and complete. Moreover, he obtained one copy of Precepts in manuscript, comprising about 7,000 *gathas*. This copy was that used by the assembly belonging to the school of the *Sarvastivadas*. The same, in fact, as is generally used in China. The masters of this school also hand down the Precepts by word of mouth, and do not commit them to writing. Moreover, in this assembly he obtained an imperfect copy of the *Abhidharma*, including altogether about 6,000 *gathas*. Moreover, he obtained a collection of *Sutras* in their abbreviated form, consisting altogether of 2,500 verses. Moreover, he obtained an expanded volume (*Vaipoulya*)[285] of the *Parinirvana*[286] *Sutra*, containing about 5,000 verses. Moreover, he procured a copy of the *Abhidharma* according to the school of the *Mahasangikas*. On this account Fah Hian abode in this place for the space of three years engaged in learning to read the Sanskrit books, and to converse in that language, and in copying the precepts.

To-ching vows to remain in India:

When To-ching arrived in mid-India and saw the customary behaviour of the Shamans, and the strict decorum observed by the assembly of priests, and their religious deportment, even in the midst of worldly influences, — then, sorrowfully reflecting on the meagre character of the Precepts known to the different assemblies of priests in the border land of China, he bound himself by a vow and said, "From the present time for ever till I obtain the condition of Buddha, may I never again be born in a frontier country." And

in accordance with this expression of his wish, he took up his permanent abode in this place, and did not return. And so Fah Hian, desiring with his whole heart to spread the knowledge of the Precepts throughout the land of Han (China), returned alone.

CHAPTER XXXVII

Fah-Hian passes through Champa in modern Bihar and arrives at the kingdom of Tamralipti[287]; visits Ceylon:

Fah-Hian remained here for two years, writing out copies of the Sacred books (*Sutras*), and taking impressions of the figures (used in worship). He then shipped himself on board a great merchant vessel. Putting to sea, they proceeded in a south-westerly direction, and, catching the first fair wind of the winter season (NE monsoon) they sailed for fourteen days and nights and arrived at the country of the Lions (Simhala, Ceylon). Men of that country (Tamralipti) say that the distance between the two is about 700 *yojanas*.

In Ceylon (Sri Lanka):

On every side of it are small islands,[288] perhaps amounting to 100 in number. They are distant from one another 10 or 20 li, and as much as 200 li. All of them depend on the great island. Most of them produce precious stones and pearls. The Mani gem[289] is also found in one district, embracing a surface perhaps of 10 *li*. The King sends a guard to protect the place. If any gems are found, the King claims three out of every ten.

CHAPTER XXXVIII

Fah-Hian is impressed with the beauty and fertility of Ceylon, the miracles performed by Buddha in the island, and the wealth of the *Sangharamas*; he becomes homesick:

Fah-Hian had now been absent from China many years; the manners and customs of the people with whom he had intercourse were entirely strange to him. The towns, people, mountains, valleys, and plants and trees which

met his eyes, were unlike those of old times. Moreover, his fellow travellers were now separated from him – some had remained behind and some were dead – to think upon the past was all that was left him! and so his heart was continually saddened. All at once, as he was standing by the side of this jasper figure, he beheld a merchant present to it, as a religious offering, a white taffeta fan, of Chinese manufacture. Unperceived (Fah Hian) gave way to his sorrowful feeling, and the tears flowing down filled his eyes.

A branch of the Bodhi tree is sent to Lanka:

A former King of this country sent an embassy[290] to mid-India, to procure a slip of the Pie-to tree. This they planted by the side of the Hall of Buddha. When it was about 220 feet high, the tree began to lean towards the SE. The King, fearing it would fall, placed eight or nine props round the tree to support it. Just in the place where the tree was thus supported, it put forth a branch, which pierced through the props, and descending to the earth, took root. This branch is about 20 inches round. The props, although pierced through the centre, still surround (the tree), which stands now without their support, yet men have not removed them. Under the tree is erected a chapel, in the middle of which is a figure (of Buddha) in a sitting posture. Both the clergy and laity pay reverence to this figure with little intermission. Within the capital, moreover, is erected the chapel of the Tooth of Buddha, in the construction of which all the seven precious substances have been employed. The King purifies himself according to the strictest Brahmanical rules, whilst those men within the city who reverence (this relic) from a principle of belief, also compose their passions according to strict rule. This kingdom, from the time when (this chapel) was erected, has suffered neither from want, famine, calamity, or revolution. The treasury of this congregation of priests contains numerous gems and a Mani jewel of inestimable value.

CHAPTER XL

The pilgrim collects manuscripts in Ceylon:

Fah Hian resided in this country for two years. Continuing his search (for sacred books), he obtained a copy of the *Vinaya Pitaka* according to the

school of the *Mahisasikas* (followers of Rahula). He also obtained a copy of the Great Agama (*Dirgagama*) and of the Miscellaneous Agama (*Sanyuktagama*), and also a volume of miscellaneous collections from the Pitakas (*Samyukta Pitaka*). All these were hitherto entirely unknown in the land of Han. Having obtained these works in the original language (Pali or Magadhi), he forthwith shipped himself on board a great merchant vessel which carried about two hundred men.

Typhoon at sea; Fah-Hian saves his books and images:

Astern of the great ship was a smaller one, as a provision in case of the large vessel being injured or wrecked during the voyage. Having got a fair wind they sailed eastward for two days, when suddenly a tempest (typhoon) sprung up, and the ship sprang a leak. The merchants then desired to haul up the smaller vessel, but the crew of that ship, fearing that a crowd of men would rush into her and sink her, cut the towing cable and fell off. The merchant men were greatly terrified, expecting their death momentarily. Then dreading lest the leak should gain upon them, they forthwith took their goods and merchandize and cast them overboard. Fah Hian also flung overboard his water-pitcher (*koundika*) and his washing basin, and also other portions of his property. He was only afraid lest the merchants should fling into the sea his sacred books and images. And so with earnestness of heart he invoked Avalokiteswara and paid reverence to the Buddhist saints of the land of Han – speaking thus: "I, indeed, have wandered far and wide in search of the Law. Oh! would that by your spiritual power, you would turn back the flowing of the water (stop the leak), and cause us to reach some resting place." Nevertheless the hurricane blew for thirteen days and nights, when they arrived at the shore of a small island, and, on the tide going out, they found the place of the leak; having forthwith stopped it up, they again put to sea on their onward voyage.

At Java:

In this ocean there are many pirates who, coming on you suddenly, destroy everything. The sea itself is boundless in extent – it is impossible to know east or west, except by observing the sun, moon, or stars in their motions. If it is dark, rainy weather, the only plan is to steer by the wind

without guide. During the darkness of night, one only sees the great waves beating one against the other and shining like fire, whilst shoals of sea monsters of every description (surround the ship). The merchant men were now much perplexed, not knowing towards what land they were steering. The sea was bottomless and no soundings could be found, so that there was not even a rock for anchorage. At length, the weather clearing up, they got their right bearings, and once more shaped a correct course and proceeded onwards. But if (during bad weather) they had happened to have struck on a hidden rock, then there would have been no way to have escaped alive. Thus they voyaged for ninety days and more, when they arrived at a country called Yo-po-ti (Java). In this country heretics and Brahmans flourish, but the Law of Buddha is not much known.

Another storm en route to China; Brahmans plot against the pilgrim:

Stopping here the best portion of five months, Fah Hian again embarked on board another merchant vessel, having also a crew of 200 men or so. They took with them fifty days provisions, and set sail on the 15th day of the fourth month. Fah Hian was very comfortable on board this ship.[291] They shaped a course NE for Kwang Chow (Canton, China). After a month and some days, at the stroke of two in the middle watch of the night, a black squall suddenly came on, accompanied with pelting rain. The merchant men and passengers were all terrified. Fah Hian at this time also, with great earnestness of mind, again entreated Avalokiteswara and all the priesthood of China to exert their Divine power in his favour, and bring them daylight. When the day broke, all the Brahmans, consulting together, said: "It is because we have got this Shaman on board with us that we have no luck, and have incurred this great mischief – come let us land this *Bikshu* on the first island we meet with, and let us not, for the sake of one man, all of us perish."

Fah-Hian's patron intervenes:

The religious patron (*Danapati*) of Fah Hian then said: "If you land this *Bikshu*, you shall also land me with him; and if not, you had better kill me: for if you really put this Shaman on shore (as you threaten), then, when I arrive in China, I will go straight to the King and tell him what you have

done. And the King of that country is a firm believer in the Law of Buddha, and greatly honours the *Bikshus* and priests." The merchantmen on this hesitated, and (in the end) did not dare to land him.

After seventy days at sea, food and water are rationed; the merchants undertake navigation themselves and after twelve days arrive at the mountains of Lau, far north of Canton. Finally, after replenishing their stocks and many more days of sailing, they reached Tsing Chow, dependent on the Leou family:

The Prince Lai Ying, who was a faithful follower of the Law of Buddha, hearing that there was a Shaman on board with sacred books and images, took ship and embarked and came on board (to see Fah Hian). Then, immediately engaging men from the nearest shore, he dispatched the books and sacred figures to be landed and taken forthwith to the seat of his government.

Fah-Hian and Chinese scholars edit the sacred books:

Meanwhile Leou of Tsing Chow entertained Fah Hian for the whole winter and summer. The summer period of rest being over, Fah Hian dismissed all the doctors of religion (who had been with him). He had been anxious for a long time to get back to Tchang'an. But as the engagements he had entered into were pressing ones, he directed his course first towards the southern capital (Nanking), where the different doctors edited the sacred books he had brought back.

Fah-Hian's travails and final arrival home:

After Fah Hian left Tchang'an, he was five years in arriving at Mid-India. He resided there during six years, and was three years more before he arrived at Tsing Chow. He had successively passed through thirty different countries. In all the countries of India, after passing the Sandy Desert (Gobi), the dignified carriage of the priesthood and the surprising influence of religion (amongst the people) cannot be adequately described. But, because our learned doctors had not heard of these things, he was induced, regardless of all personal considerations, to cross the seas, and to encounter every conceivable danger in returning home. Having been preserved

therefore by Divine power (of the Three Honourable Ones), and brought through all dangers safely, he was further induced to commit to writing these records of his travels, desiring that the virtuous of all ages may be informed of them together, as well as himself.

In this year (414-15 AD) Kea-yin, being the twelfth of the reign of I Hi of the Tsin dynasty, when the star Sheou (autumn equinox) was just emerging from the summer mansion, Fah Hian, the pilgrim, arrived home. He was detained all the winter in answering the multitude of questions put to him. Whoever enquired of him respecting his travels he always answered obligingly and exactly according to truth. Of these answers, the summary is found in this book. But when they pressed him to write a full record of all that happened to him from first to last, then he said, “If I were to recall all which has occurred to me, then persons of unstable minds would be excited to strive how they might enter on similar dangers and encounter corresponding risks, reckless of their personal safety. For they would argue in this way, ‘Here is a man who has escaped all and come back safe and sound;’ and so these foolish persons would set about jeopardising their lives in lands impossible to explore, and to pass through which, not one in ten thousand could hope for.” On hearing these remarks, they all said, with a sigh of assent, “This man, in order to preserve the knowledge of old things and new, has himself penetrated to the eastern source of the great doctrine, and is yet alive. He has sought out the Law, and now exhibits it to us. Equally with us, then, shall all those who hereafter attain this knowledge, give him boundless thanks. And those also who assist to diffuse this knowledge, where it has not prevailed, shall acquire incalculable merit; and the chief merit of a sage is this – to neglect those things which are generally esteemed, and esteem those things which are generally neglected.”

❑

.

CHAPTER — 13

HWUI SENG AND SUNG YUN

Journey in search of the Buddhist texts:[292]

In the suburb Wan I, to the N.E. of the city of Lo-Yang, was the dwelling of Sung Yun of Tun-Wang, who, in company with the *Bikshu* Hwui Seng, was sent on an embassy to the western countries by the Empress Dowager (Tai Hau) of the Great Wei dynasty, to obtain Buddhist books. Of these they procured altogether 170 volumes, all standard works, belonging to the Great Vehicle.

First of all, having repaired to the capital, they proceeded in a westerly direction 40 days, and arrived at the Chih Ling (Barren Ridge), which is the western frontier of the country. On this ridge is the fortified outpost of the Wei territory.

Ascending the Chih Ling and proceeding westward 23 days, having crossed the Drifting Sands, they arrived at the country of the To-kuh-wan (Eastern Turks). Along the road the cold was very severe, whilst the high winds and the driving snow, and the pelting sand and gravel were so bad, that it was impossible to raise one's eyes without getting them filled. The chief city of the To-kuh-wan is pleasantly situated; and the climate of the neighbourhood is agreeably warm. The written character of this country is the same as that of the Wei empire; the rules both of clergy and laity observed by these people are mostly barbarous. From this country, going west 3,500 *li*, we arrive at the city of Shen-Shen (now called Makhai). This city, from its foundation, has been under the rule of the To-kuh-wan; and at present there resides in it a military officer of that country, with a body of troops, who are employed in subjugating the western Tartars.

From Shen-Shen, going west 1640 *li*, we arrive at the city of Tso-moh (Tehe-mo-to-na of Yuan Chwang). In this town there are, perhaps, a hundred families resident. The country is not visited with rain, but they irrigate their crops from the streams of water. They know not the use of oxen or ploughs in their husbandry.

Buddha images in China:

In the town is a representation of Buddha, with a Bodhisatwa – but certainly not executed by any Tartar. On questioning an old man about it, he said, "This was done by Lu-kwong, who subdued the Tartars." From the city, going westward 1275 *li*, we arrive at the city of Moh.

Buddha tower in Han-Mo:

From the city Moh, going west 22 *li*, we arrive at the city of Han-Mo.[293] Fifteen *li* to the south of this city is a large temple, with about 300 priests in it. These priests possess a golden full-length figure of Buddha, in height a *chang* and 6/10 (about 18 feet). Its appearance is very imposing, and all the characteristic marks of the body are bright and distinct. Its face was placed as usual looking eastward; but the figure, not approving of that, turned about and looked to the west. The old men have the following tradition respecting this figure:- They say that originally it came from the south, transporting itself through the air. The King of Khoten desiring himself to see it for the purpose of paying reverence to it, they attempted to convey it to his city, but in the middle of the route, when they halted at night, the figure suddenly disappeared. On dispatching men to look after it, they found it had returned to its old place. Immediately, therefore, (the King) raised a tower (over it), and appointed 400 attendants to sweep and water (the tower). If any of these servitors receive a hurt of any kind, they apply some of the gold leaf from off this figure to the injured part, and so are directly cured. Men in after ages began to build houses around the spot where this image was, (and so the town sprang up). The tower of this image, and the other towers, are ornamented with many thousand flags and streamers of variegated silk. There are perhaps, as many as 10,000 of these, and more than half of them belonging to the Wei country. Over the flags are inscriptions in the square character, recording the several dates when they were presented; the greater number are of the nineteenth year of Tai-Wo, the second year of King Ming (510 AD) and the second year of Yen Chang. There was only one flag with the name of the reigning monarch on it, and this was in the time of Yaou Tsun.

At Khoten; cremation and royal burials:

From the town of Han-Mo, going west 878 *li*, we arrive at the country of Khoten. The king of this country wears a golden cap on his head, in shape like the comb of a cock; the appendages of the head-dress hang down behind him two feet, and they are made of taffeta (*kun*), about five inches wide. On State occasions, for the purpose of imposing effect, there is music performed, consisting of drums, horns, and golden cymbals. The King is also attended by one chief bowman, two spearmen, five halberdiers, and, on his right and left, swordsmen, not exceeding one hundred men. The poorer sort of women here wear trowsers, and ride on horseback just as well as their husbands. They burn their dead, and, collecting the ashes, erect towers over them. In token of mourning, they cut their hair and disfigure their faces, as though with grief. Their hair is cut to a length of four inches, and kept so all round. When the king dies, they do not burn his body, but enclose it in a coffin and carry it far off and bury it in the desert. They found a temple to his memory, and, at proper times, pay religious service to his manes.

Buddhism comes to Khoten:

The king of Khoten was no believer in the Law of Buddha. A certain foreign merchantman, on time, brought a *Bikshu* called Pi-lou-chan (Vairochana?) to this neighbourhood and located him under a plum-tree to the south of the city. On this, an informer approached the King and said, "A strange Shaman has come (to your dominions) without permission, and is now residing to the south of the city, under the plum-tree." The King, hearing this, was angry; and forthwith went to see Vairochana. The *Bikshu* then addressed the King as follows: "Ju-lai (Tathagata) has commissioned me to come here to request your Majesty to build for him a perfectly finished pagoda (i.e., pagoda with a spire), and thus secure to yourself perpetual felicity." The King said, "Let me see Buddha and then I will obey him." Vairochana then, sounding a gong,[294] requested (Buddha to appear); on which Buddha commissioned Rahula to assume his appearance and manifest himself in his true likeness in the air. The King prostrated himself on the ground in adoration, and at once made arrangements for founding a temple under the tree. Then he caused to be carved a figure of Rahula as he appeared in the air; and, for fear of its perishing, the King afterwards

constructed a chapel for its special preservation. At present it is carefully protected by a sort of shade (jar), that covers it; but, notwithstanding this, the shadow of the figure constantly removes itself outside the building, so that those who behold it can scarcely help becoming converts. In this place (or chapel) are the shoes of a Pratyeka Buddha, which have up to the present time resisted decay. They are made neither of leather or silk, - in fact, it is impossible to determine what the material is. The extreme limits of the kingdom of Khoten reach about 3000 *li* or so, from east to west.

In Yerkiang, vegetarianism; Brahman script:

In the second year of Shan Kwai (519 AD) and the 7th month, 29th day, we entered the kingdom of Shih-Ku-Po (Tchakouka, Yerkiang). The people of that country are mountain dwellers. The five kinds of cereals grow in abundance. In eating these, they make them into cakes. They do not permit the slaughter of animals, and such of them as eat flesh only use that which dies of itself. The spoken language both of clergy and laity is like that of the people of Khoten, but the written character in use is that of the Brahmans. The limits of this country can be traversed in about five days.

Dragon tamed by Brahman spells:

During the first decade of the 8th month, we entered the country of Han-Pan-to (Kie-pan-to; Kartchou of Yuan Chwang). Still going west six days, we entered on the Tsung Ling mountains; and advancing yet three days to the west, we arrived at the city of Kiueh-Yu; and after three days more, to the Puh-ho-i mountains ('Untrustworthy Mountains'). This spot is extremely cold. The snow accumulates both by winter and summer. In the midst of the mountain is a lake in which dwells a mischievous dragon. Formerly there was a merchant who halted by the side of the lake. The dragon just then happened to be very cross, and forthwith pronounced a spell and killed the merchant. The King of Pan-to (Kartchou), hearing of it, dispatched an embassy with his own son to the country of Ou-chang (Udyana), to acquire knowledge of the spells used by the Brahmans. After four years, having procured these secrets, they came back to the King, who again sent them to the lake to enchant the dragon. Having recited the spells, lo! the dragon was changed into a man, who, deeply sensible of his

wickedness, approached the King. The King immediately banished him from the Tsung Lung mountains, more than 1000 *li* from the lake. The king of the present time is of the 13th generation (from these events).

The pilgrims move to Ye-tha, a rich land of unbelievers:

In the first decade of the 10th month we arrived at the country of the Ye-tha. The lands of this country are abundantly watered by the mountain streams, which fertilise them and flow in front of all the dwellings. They have no walled towns; but they keep order by means of a standing army that constantly moves here and there. These people also use felt garments. The course of the rivers is marked by the verdant shrubs that fringe their banks. In the summer the people seek the cool of the mountains; in the winter they disperse themselves through the villages. They have no written character. Their rules of politeness are very defective. They have no knowledge at all of the movements of the heavenly bodies; and, in the division of the year, they have no intercalary month, or any long and short months; but they merely divide the year into twelve parts, and that is all. They receive tribute from all surrounding nations: on the south as far as Tieh-lo;[295] on the north, the entire country of Lae-Leh,[296] eastward to Khoten, and west to Persia – more than forty countries in all. When they come to the court with their presents for the king, there is spread out a large carpet about forty paces square, which they surround, with a sort of rug hung up as a screen. The king puts on his robes of state and takes his seat upon a gilt couch, which is supported by four golden phœnix birds. When the ambassadors of the Great Wei dynasty were presented (Sung Yun and Hwui Seng), (the king), after repeated prostrations,[297] received their letters of instruction. On entering the assembly, one man announces your name and title; then each stranger advances and retires. After the several announcements are over, they break up the assembly. This is the only rule they have; there are no instruments of music visible at all. The royal ladies of the Ye-tha (Little Yuchi, White Huns) country also wear state robes, which trail on the ground three feet and more; they have special bearers for carrying these lengthy robes. They also wear on their heads a horn, in length eight feet[298] and more, three feet of its length being red coral. This they ornamented with all sorts of gay

colours, and such is their head-dress. When the royal ladies go abroad, then they are carried (in a chariot); when at home, then they seat themselves on a gilded couch, which is made in the shape of a six-tusked white elephant, with four lions (for support). As for the rest of the great ladies, they all in like manner cover their heads, using horns, from which hang down veils all round, like precious canopies. Both the rich and poor have their distinctive modes of dress. These people are of all the four tribes of barbarians the most powerful. The majority of them are unbelievers. Most of them worship false gods. They kill living creatures and eat their flesh. They use the seven precious substances, which all the neighbouring countries bring as tribute, and gems in great abundance.

In Kashmir:

In the middle decade of the 11th month we entered the country of Shie Mi (Cashmere?). This country is just beyond the Tsung Ling mountains. The aspect of the land is still rugged; the people are very poor; the rugged narrow road is dangerous – a traveller and his horse can hardly pass along it, one at a time. From the country of Po-lu-lai (Bolor) to the country of Ouchang (Oudyana) they use iron chains for bridges. These are suspended in the air for the purpose of crossing (the mountain chasms). On looking downwards no bottom can be perceived; there is nothing to grasp at in case of a slip, but in a moment the body is hurled down 10,000 fathoms. On this account travellers will not cross over, in case of high winds.

In Oudyana:

On the first decade of the 12th month we entered Ouchang country. On the north this country borders on the Tsung Ling mountains; on the south it skirts India. The climate is agreeably warm. The territory contains several thousand *li*. The people and productions are very abundant. The fertility of the soil is equal to that of Lin-tsze (in Shantung) and the climate more equable. This is the place where Pi-lo (Avalokiteswara?) delivered the child, and where Bodhisatwa gave his body (to the tigress).[299] Once on a time the whole body of the people left the land, except the clergy, but these availed to protect it. The king of the country religiously observes a vegetable diet; on the great fast days (vide Jul. ii. 6, n.) he pays adoration to Buddha, both

morning and evening, with sound of drum, conch, *vina* (a sort of lute), flute and all kinds of wind instruments. After mid-day he devotes himself to the affairs of government. Supposing a man has committed murder, they do not suffer him to be killed; they only banish him to the desert mountains, affording him just food enough to keep him alive. In investigating doubtful cases, – as, for example, cases of poisoning by accident (by) administering medicine for the purpose of cleansing the system, - then, after examination, the punishment is adjusted according to the serious or trivial character of attending circumstances. At the proper time, they let the streams overflow the land, by which the soil is rendered soft and fertile. All provisions necessary for man are very abundant, cereals of every kind flourish, and the different fruits ripen in great numbers. In the evening the sound of the convent bells may be heard on every side, filling the air with their melody; the earth is covered with flowers of different hues, which succeed each other winter and summer, and are gathered by clergy and laity alike as offerings for Buddha.

Sung Yun meets the king, tells him about Confucius and Lao-Tse:

The king of the country seeing Sung Yun (enquired about him, and) on their saying that the ambassadors of the Great Wei (dynasty) had come to salute him, he courteously received their letters of introduction. On understanding that the Empress Dowager was devotedly attached to the Law of Buddha, he immediately turned his face to the east and, with closed hands and meditative heart, bowed his head (in prayer); then, sending for a man who could interpret the Wei language, he questioned Sung Yun and said, “Are my honourable visitors men from the region of Sun-rising?” Sung Yun answered and said, “Our country is bounded on the east by the great sea; from this the sun rises according to the Divine will (the command of Tathagata).” The king again asked, “Does that country produce holy men?” Sung Yun then proceeded to enlarge upon the virtues of Confucius and Laou (Tseu) of the Chow dynasty, and then of the silver walls and golden palaces of Fairy Land (Pung loi Shan), and then of the spirits, genii, and sages, who dwell there; in connection with the above he further dilated on the subjects of divination, alchemy and magic, and medicine; descanting on these various subjects and properly distinguishing their several

properties, he finished his address. Then the king said, “If these things are really as your worship says, then truly yours is the land of Buddha, and I ought to pray at the end of my life that I may be born in that country.”

The pilgrims visit the holy sites associated with Buddha:

After this, Sung Yun, with Hwui Seng, left the city for the purpose of inspecting the traces which exist of the teaching (religion) of Tathagata. To the east of the river is the place where Buddha dried his clothes. When first Tathagata came to the country of Ou-chang, he went to convert a dragon king. He, being angry with Buddha, raised a violent storm with rain. The *Sanghati* of Buddha was soaked through and through with the wet. After the rain was over, Buddha stopped on a rock, and, with his face to the east, sat down whilst he dried his robe (*Kasha*). Although many years have elapsed since then, the traces of the stripes of the garment are as visible as if newly done, and not merely the seams and bare outline, but one can see the marks of the very tissue itself, so that in looking at it, it appears as if the garment had not been removed, and, if one were asked to do it, as if the traces might be lifted up (as the garment itself). There are memorial towers erected on the sport where Buddha sat, and also where he dried his robe. To the west of the river is a tank occupied by a Naga Raja. By the side of the tank is a temple served by fifty priests and more. The Naga Raja ever and anon assumes supernatural appearances. The king of the country propitiates him with gold and jewels, and other precious offerings, which he casts into the middle of the tank; such of these as afterwards find their way out through a side exit, the priests are permitted to retain. Because the Dragon thus provides for the necessary expenses of this temple (clothes and food), therefore men call it the Naga Raja temple.

Traces of Buddha:

Eighty *li* to the N. of the royal city there is the trace of the shoe of Buddha on a rock. They have raised a tower to enclose it. The place where the print of the shoe is left on the rock, is as if the foot had trodden on soft mud. Its length is undetermined, as at one time it is long, and at another time short. They have now founded a temple on the spot, capable of accommodating seventy priests and more. Twenty paces to the south of the tower is a spring

of water issuing from a rock. It was here Buddha once came to cleanse (his person), on which occasion he bit off a piece of his tooth-stick (*Dantakashta*) (Jul. iii. 49 and ii. 55), and planted it in the ground; it immediately took root, and is at present a great tree, which the Tartars call Po-lou (*Pilu* tree, *Salvadora Persica*). To the north of the city is the To-lo (Salatoura) temple, in which there are very numerous appliances for the worship of Buddha. The pagoda is high. The priests' chambers are ranged in order round the temple (or tower). There are sixty full-length golden figures (herein). The king, whenever he convenes (or convening yearly) a great assembly, collects the priests in this temple. On these occasions the Shamans within the country flock together in great crowds. Sung Yung and Hwui Seng, remarking the strict rules and eminent piety (extreme austerities) of those *Bikshus*, and from a sense that the example of these priests singularly conduced to increase (their own) religious feelings, remitted two servants for the use of the convent to prepare the religious offerings and to water and sweep the temple. From the royal city, going S.E. over a mountainous district, eight days' journey, we come to the place where Tathagata, practicing austerities, gave up his body to feed a starving tiger. It is a high mountain, with scarped precipices and towering peaks that pierce the clouds. The fortunate tree (*Kalpa-vriksh*) and the Ling chi grow here in abundance, whilst the groves and fountains (or forest rivulets), the docile stags and the variegated hues of the flowers, all delight the eyes. Sung Yun and Hwui Seng devoted a portion of their travelling funds to erect a pagoda on the crest of the hill, and they inscribed on a stone, in the square character, an account of the great merits of the Wei dynasty. This mountain possesses a temple called "collected bones," with 300 priests and more. One hundreds and odd *li* to the south of the royal city is the place where Buddha (*Julai*), formerly residing in the Ma-hui country, peeled off his skin for the purpose of writing upon it, and extracted (broke off) a bone of his body for the purpose writing with it. Asoka Raja raised a pagoda on this spot for the purpose of enclosing these sacred relics. It is about ten *chang* high (120 feet). On the spot where he broke off his bone, the marrow ran out and covered the surface of a rock, which yet retains the colour of it, and is unctuous as though it had only recently been done.

Hill of Prince Sudatta; Sung Yun becomes home-sick:

To the S.W. of the royal city, 500 *li*, is the Shen-chi hill (of Prince Sudatta). The sweet waters and delicious fruits (of this place) are spoken of in the Sacred Books (the *Sutras* and *Vyakaranas*). The grottoes of this mountain are agreeably warm; the trees and shrubs retain a perpetual verdure. At the time when the pilgrims arrived, the gentle breeze which fanned the air, the songs of the birds, the trees in their springtide beauty, the butterflies that fluttered over the numerous flowers, - all this caused Sung Yun, as he gazed on this lovely scenery in a distant land, to revert to home thoughts; and so melancholy were his reflections, that he brought on a severe attack of illness; after a month, however, he obtained some charms of the Brahmans, which gave him ease.

To the S.E. of the crest of the hill Shen-chi, is a rock-cave of the Prince,[300] with two chambers to it. Ten paces in front of this cave is a great square stone on which it is said the Prince was accustomed to sit; above this Asoka raised a memorial tower.

Piety and Samadhi:

One *li* to the south of the tower is the place of the Pansala (leafy hut) of the Prince. One *li* N.E. of the tower, fifty paces down the mountain, is the place where the son and daughter of the Prince persisted in circumambulating a tree (to escape a Brahman who had begged them from their father as slaves). On this the Brahman beat them with rods till the blood flowed down and moistened the earth. This tree still exists, and the ground, stained with blood, now produces a sweet fountain of water. Three *li* to the west of the cave is the place where the heavenly king Sekra, assuming the appearance of a lion sitting coiled up in the road, concealed Man-kea.[301] On the stone are yet traces of his hair and claws. The spot also where Adjitakouta[302] and his disciples nourished the Father and Mother (Prince and Princess). All these have memorial towers. In this mountain formerly were the beds of 500 *Arhats* ranged N. and S. in a double row. Their seats also were placed opposite one to another. There is now a great temple here with about 200 priests. To the north of the fountain which supplied the Princes with water is a temple. A herd of wild asses frequent this spot for grazing. No one drives them here, but they resort here of their

own accord. Daily at early morn they arrive – they take their food at noon, and so they protect the temple. These are spirits who protect the tower commissioned for this purpose by the Rishi Uh-po (Oupagupta?). In this temple there formerly dwelt a *Shami* (*Samanera*), who, being constantly occupied in sifting ashes (belonging to the convent), fell into a state of fixed composure (Samadhi). The Karmadana of the convent had his funeral obsequies performed, thinking he was dead, and not observing that his skin continued unchanged. After his burial, the Rishi Oupa continued to take the office of the *Samanera* in the place of sifting the ashes. On this the king of the country founded a chapel to the Rishi, and placed in it a figure of him as he appeared, and ornamented it with much gold leaf.

Rahats and *Yakshas;* and the kingdom of Gandhara:

Close to the peak of this hill is a temple of Po-kin (*Bhagavan*?), built by the Yakshas. There are about 80 priests in it. They say the *Rahats* and *Yakshas* continually come to offer religious services, to water and sweep the temple, and to gather wood for it. Ordinary priests are not allowed to occupy this temple. The Shaman To Yung, of the Great Wei dynasty, came to this temple to pay religious worship; but having done so, he departed, without daring to take up his quarters there. During the middle decade of the 4th month of the reign Ching Kwong (520 AD), we entered the kingdom of Gandhara. This country closely resembles the territory of Ou-chang. It was formerly called the country of Ye-po-lo.[303] This is the country which the Ye-thas (Little Yuchi) destroyed and afterwards set up Lae-lih to be king over the country; since which events two generations have passed. The disposition of this king was cruel and vindictive, and he practiced the most barbarous atrocities. He did not believe the Law of Buddha, but loved to worship demons. The people of the country belonged entirely to the Brahman caste; they had a great respect for the law of Buddha, and loved to read the Sacred Books, when suddenly this king came into power, who was strongly opposed to anything of the sort, and entirely self-reliant. Trusting to his own strength, he had entered on a war with the country of Ki-pin (Cophene)[304] respecting the boundaries of their kingdom, and his troops had been already engaged in it for three years.

Gandhara king meets Sung Yun, who feels slighted by his conduct:

The King has 700 war elephants, each of which carries ten men armed with sword and spear, whilst the elephants are armed with swords attached to their trunks, with which to contend when at close quarters. The King continually abode on the frontier and never returned (to his kingdom), in consequence of which the seniors had to labour and the common people were oppressed. Sung Yun repaired to the royal camp to deliver his credentials. The King[305] was very rough with him, and failed to salute him. He sat still whilst receiving the letters. Sung Yung perceived that these remote barbarians were unfit for exercising public duties, and that their arrogancy refused to be checked. The King now sent for interpreters, and addressed Sung Yun as follows:- "Has your worship not suffered much inconvenience in traversing all these countries and encountering so many dangers on the road." Sung Yun replied, "We have been sent by our royal mistress to search for works of the great translation through distinct regions. It is true the difficulties of the road are great, yet we dare not complain or say we are fatigued; but your majesty and your forces as you sojourn here on the frontier of your kingdom, enduring all the changes of heat and cold, are you not also nearly worn out?" The King, replying, said: "It is impossible to submit to such a little country as this, and I am sorry that you should ask such a question." Sung Yun, on first speaking with the King (thought), "this barbarian is unable to discharge with courtesy his official duties,- he sits still whilst receiving diplomatic papers, and is wrapped up in himself;" but, on second thoughts, reflecting that he also had the feelings of a man, he determined to reprove his conduct and said, "Mountains are high and low – rivers are great and small – amongst men also there are distinctions, some being noble and others ignoble. The sovereign of the Ye-tha, and also of Ou-chang, when they received our credentials, did so respectfully; but your Majesty alone has paid us no respect." The King, replying, said, "When I see the King of the Wei, then I will pay my respects; but to receive and read his letters whilst seated, is surely no such outrageous occurrence. When men receive a letter from father or mother, they don't rise from their seats to read it. The Great Wei sovereign is to me (for the nonce) both father and mother, and so, without being unreasonable, I will read the letters you bring me, still sitting down." Sung Yun then took

his departure without any official salutation. He took up his quarters in a temple in which the religious services were very poor. At this time the country of Po-tai[306] sent two young lions to the King of Gandhara as a present. Sung Yun had an opportunity of seeing them; he noticed their fiery temper and courageous mien. The pictures of these animals common in China are not at all good resemblances of them.

Sung Yun continues his pilgrimage; arrives at the Indus:

After this, going west five days, they arrived at the place where Tathagata made an offering of his head for the sake of a man – where there is both a tower and temple, with about twenty priests. Going west three days, we arrive at the great river Sin-tou. On the west bank of this river is the place where Tathagata took the form of a great fish called Ma-kie (*Magara*), and came out of the river, and for twelve years supported the people with his flesh. On this spot is raised a memorial tower. On the rock are still to be seen the traces of the scales of the fish.

Buddhist stupas:

Again going west thirteen days' journey, we arrived at the city of Fo-sha-fu.[307] The river valley is a rich loamy soil. The city walls are constructed with double gates. There are very many groves (around the city), whilst fountains of water enrich the soil; and, as for the rest, there are costly jewels and gems in abundance. Both clergy and laity are honest and virtuous. Within this city there is a heretical temple of ancient date called "Sang-the" (*Santi*?). All religious persons frequent it and highly venerate it. To the north of the city, one *li*, is the temple of the White Elephant Palace.[308] Within the temple all is devoted to the service of Buddha. There are here stone images highly adorned and very beautiful, very many in number, and covered with gold sufficient to dazzle the eyes. Before the temple and belonging to it is a tree called the White Elephant Tree, from which, in fact, this temple took its origin and name. Its leaves and flowers are like those of the Chinese Date tree, and its fruit begins to ripen in the winter quarter. The tradition common amongst the old people is this: "That when this tree is destroyed, then the Law of Buddha will also perish." Within the temple is a

picture of the Prince (Sudatta) and his wife with their children, begging of a Brahman. The Tartar (conquerors), seeing this picture, were so moved that they could not refrain from tears.

Buddha's prophecy about Kanishka, who builds a magnificent pagoda:

Again going west one day's journey, we arrive at the place where Tathagata gave his eyes in charity. Here also is a tower and a temple. On a stone of the temple is the impress of the foot of Kasyapa Buddha. Again going west one day we crossed a deep river (Indus), more than 300 paces broad. Sixty *li* S.W. of this we arrive at the capital of the country of Gandhara (hence Peshawar). Seven *li* to the S.E. of this city there is a Tsioh–li Feou-thou.[309] Investigating the origin of this tower, we find that when Tathagata was in the world he was passing once through this country with his disciples on his mission of instruction; on which occasion, when delivering a discourse on the east side of the city, he said, "Three hundred years after my Nirvana, there will be a king of this country called Ka-ni-si-ka (Kanishka). On this spot he will raise a pagoda (Feou-thou). Accordingly, 300 years after that event, there was a king of this country, so called. On one occasion, when going out to the east of the city, he saw four children engaged in making a Buddhist tower out of dung; they had raised it about three feet high, when suddenly they disappeared. [The record states, "One of the children, raising himself in the air and turning towards the king, repeated a verse (*Gatha*).] The king surprised at this miraculous event, immediately erected a tower for the purpose of enclosing (the small pagoda), but gradually the small tower grew higher and higher, and at last went outside and removed itself 400 feet off, and there stationed itself. Then the king proceeded to widen the foundation of the great tower 300 paces and more.[310] To crown all, he placed a roof-pole upright and even. Throughout the building he used ornamental wood; he constructed stairs to lead to the top. The roof consisted of every kind of wood. Altogether there were thirteen storeys; above which there was an iron pillar, 3 feet high,[311] with thirteen gilded circlets. Altogether the height from the ground was 700 feet. This meritorious work being finished, the dung pagoda, as at first, remained three paces south of the great tower. The Brahman, not believing

that it was really made of dung, dug a hole in it to see. Although years have elapsed since these events, this tower has not corrupted; and although they have tried to fill up the hole with scented earth, they have not been able to do so. It is now enclosed with a protecting canopy. The Tsioh-li pagoda, since its erection, has been three times destroyed by lightning, but the kings of the country have each time restored it. The old men say, "When this pagoda is finally destroyed by lightning, then the Law of Buddha also will perish." The record of To-Yung says, "When the king had finished all the work expect getting the iron pillar up to the top, he found that he could not raise this heavy weight. He proceeded, therefore, to erect at the four corners a lofty stage; he expended in the work large treasures, and then he, with all his court and princes ascending on to it, burnt incense and scattered flowers, and, with their hearts, called on the gods to help them; then, with one turn of the windlass, they raised the weight and so succeeded in elevating it to its place. The Tartars say, therefore, that the four heavenly kings lent their aid in this work, and that, if they had not done so, no human strength would have been of any avail. Within the pagoda there is contained every sort of Buddhist utensil; here are gold and jewelled (vessels) of a thousand forms and vast variety – to name which even would be no easy task; at sunrise the gilded discs of the vane are lit up with dazzling glory, whilst the gentle breeze of morning causes the precious bells (suspended from the roof) to tinkle with a pleasing sound. Of all the pagodas of the western world, this one is by far the first (in size and importance). At the first completion of this tower they used true pearls in making the network-covering over the top; but after some years, the king, reflecting on the enormous value of this ornamental work, thought thus with himself: "After my decease (funeral) I fear some invader may carry it off" – or "supposing the pagoda should fall, there will be no one with means sufficient to re-build it;" – on which he removed the pearl work and placed it in a copper vase, which he removed to the N.W. of the pagoda 100 paces, and buried it in the earth. Above the spot he planted a tree, which is called Po-tai (*Bodhi*), the branches of which, spreading out on each side, with their thick foliage, completely shade the spot from the sun. Underneath the tree on each side there are sitting figures (of Buddha) of the same height, viz. a *chang* and a half (17 feet). There are always four dragons in attendance to protect these jewels; if a man (in his heart) covets them, calamities immediately befall him. There is also a stone

tablet erected on the spot, and engraved on it are these words of direction: “Hereafter, if this tower is destroyed, after long search, the virtuous man may find here pearls (of value sufficient) to help him restore it.”

Seeking omens from the tower of fortune to return home:

Fifty paces to the south of the Tsioh-li pagoda there is a stone tower, in shape perfectly round, and two *chang* high (27 feet). There are many spiritual portents gathered from this building; so that men, by touching it, can find out if they are lucky or unlucky. If they are lucky, then by touching it the golden bells will tinkle; but if unlucky, then, though a man should violently push the tower, no sound would be given out. Hwui Seng, having travelled far from his country and fearing that he might not have a fortunate return, paid worship to this sacred tower, and sought a sign from it. On this, he did but touch it with his finger and immediately the bells rang out. Obtaining this omen, he comforted his heart. And the result proved the truth of the augury. When Hwui Seng first went up to the capital, the Empress had conferred upon him a thousand streamers of a hundred feet in length and of the five colours, and five hundred figured (mats?) of scented grass. The princes, dukes and nobility had given him two thousand flags. Hwui Seng, in his journey from Khoten to Gandhara, - wherever there was a disposition to Buddhism, - had freely distributed these in charity; so that when he arrived here, he had only left one flag of 100 feet in length, given him by the Empress. This he decided to offer as a present to the tower of Sivika Raja, whilst Sung Yun gave two slaves to the Tsioh-li pagoda, in perpetuity, to sweep it and water it. Hwui Seng, out of the little funds he had left, employed a skilful artist to depict on copper the Tsioh-li pagoda and also the four principal pagodas of Sakya Mouni.

Crossing the Indus:

After this, going N.W. seven days’ journey, they crossed a great river (Indus), and arrived at the place where Tathagata, when he was Sivika Raja, delivered the dove; here there is a temple and a tower also. There was formerly here a large storehouse of Sivika Raja, which was burnt down. The grain which was in it was parched with the heat, and is still to be found in the neighbourhood (of the ruins). If a man takes but a single grain of this, he

never suffers from fever; the people of the country also take it to prevent the power of the sun hurting them.

Homage to the Buddha's relics:

The records of To-ung say, "At Na-ka-lo-ho (Nagarahara) there is a skull bone of Buddha, four inches round, of a yellowish-white colour, hollow underneath, sufficient to receive a man's finger; to the touch it is soft as wax."

We then visited the Ki-ka-lam[312] temple. This contains the robe (*kasha*) of Buddha in thirteen pieces. In measurement this garment is as long as it is broad. Here also is the staff of Buddha, in length a *chang* and seven-tenths (about 18 feet), in a wooden case, which is covered with gold leaf. The weight of this staff is very uncertain; sometimes it is so heavy that a hundred men cannot raise it, and at other times it is so light that one man can lift it. In the city of Nagrak is a tooth of Buddha and also some of his hair – both of which are contained in precious caskets; morning and evening religious offerings are made to them.

We next arrive at the cave of Gopala, where is the shadow of Buddha. Entering the mountain cavern fifteen feet, and looking for a long time at the western side of it opposite the door, then at length the figure, with all its characteristic marks, appears; on going nearer to look at it, it gradually grows fainter and then disappears. On touching the place where it was with the hand, there is nothing but the bare wall. Gradually retreating, the figure begins to come in view again, and foremost is conspicuous that peculiar mark between the eyebrows (*ourna*), which is so rare among men. Before the cave is a square stone, on which is a trace of Buddha's foot.

One hundred paces S.W. of the cave is the place where Buddha washed his robe. One *li* to the north of the cave is the stone cell of Mogalan; to the north of which is a mountain, at the foot of which the great Buddha, with his own hand made a pagoda, ten *chang* high (115 feet). They say that when this tower sinks down and enters the earth, then the Law of Buddha will perish. There are, moreover, seven towers here; to the south of which is a stone with an inscription on it; they say, Buddha himself wrote it. The foreign letters are distinctly legible even to the present time.

Hwui Seng abode in the country of Ou-chang two years. The customs of the clergy and the laity of the western foreigners (Tartars) are, to a great extent, similar (with ours); the minor differences we cannot fully detail. When it came to the second month of the second year of Ching-un (521 AD) he began to return.

The foregoing account is principally drawn from the private records of To-Yung and Sung Yun. The details given by Hwui Seng were never wholly recorded.

❑

.

CHAPTER — 14

YUAN CHWANG

Hieun Tsiang (also Hsuan-tsang, now Yuan Chwang) was among the best informed of the writers who visited India. His journey, like that of Fa-hien, was primarily concerned with Buddhism for he desired to see and worship the sacred land, collect authoritative Buddhist *sutras*, and study the depth of Buddhist philosophy. It was, in the words of Asoka's Rock Edict 8, a *dharma-yatra* to the sacred Buddhist cosmos of Serindia and India proper.[313] The Chinese pilgrim assiduously gathered geographical details of the regions he traversed, the climate and agriculture, wealth and character of the people, the presence of Buddhist monks and monasteries and the dominant sects (*Hinayana* or *Mahayana*) therein, and also the presence or dominance of Hindus and Jainas. He indicated if the king was friendly or unfriendly towards Buddhism, and the vitality of Buddhism in a particular kingdom, thus alluding to the importance of royal patronage for the faith.[314]

Yuan Chwang has been criticised for being too credulous about stories of Buddhist miracles, yet his record is of lasting significance to students of ancient Buddhist thought as his collection of tales and traditions then prevalent in India help reconstruct the atmosphere of the time. As he interacted with important Indian rulers and witnessed some important events, his account gives insight into India of the first millennium AD.

Northwest India and Central Asia were always regions of intense political and cultural exchange. Yuan Chwang passed through the region when it was ruled by the Western Turks, necessitating a guarantee of safe conduct from the king of the Turks. Harsha patronised the pilgrim, whose personal account of the king is arresting. He gives precise data such as the fact that Nalanda was purchased for Buddhist monks by merchants for ten *kotis*, and that it was supported from the revenues of one hundred villages. But his lasting significance was for archaeologists: Gen. Alexander Cunningham discovered Nalanda and Vaisali by following his footsteps.

Scholars have generally assigned three dates for the birth of Yuan Chwang (ca. 600-664), namely, 596, 600, and 602; most Chinese scholars prefer 600, but the Western favour 602. After an early interest in *Yogacara*, Yuan Chwang realized the inadequacy of extant Chinese texts and set off in 627

to procure the authentic teachings and the encyclopædic *Yogacara-bhumi*. He spent fourteen years (629-643) in India, studying *Yogacara*, *Sarvastivada*, *Madhyamika*, logic, grammar and the *Vedas* under eminent teachers. Returning home, he translated 75 of the 657 works he carried back with him. In 645 he was received by Emperor Tai-ts‘ung who encouraged him to write the *Record of Travels to the Western Regions*. His biography was compiled by Hui-li who died while working on it, and the task was then completed by Yen-tsung on 20 April 688 (K 1071). The first five chapters of "*Life*" narrate the pilgrim's family background, travels from China to Central Asian kingdoms, and his return journey, while the next five chapters describe his activities in China on the basis of contemporary documents. The '*Life'* ably supplements Yuan Chwang's '*Record of the Western World*' and furthers understanding of the status of Buddhism in the seventh century Central Asian states, India, and China.

Yuan Chwang and Kumarajiva were the greatest translators of Buddhist texts into Chinese. He was so accomplished in Sanskrit that he translated Lao-tzu into Sanskrit. He established the *Vijnaptimatra* school of Buddhism in China. The '*Record*' and '*Life'* deepen our understanding of the Silk Route, and his initiatives paved the way for diplomatic relations between India and China. Several embassies were exchanged between Harsavardhana and Tai-ts‘ung. He told his countrymen about India's invention of sugar, called *shimi* 'stone honey' in Chinese (*sarkara* 'sugar, crystals, granules, stonelets'), and the Emperor sent the ambassador Wang Hsüan-ts'e to get sugar technology from India.

The '*Life'* was first translated by Stanislas Julien in 1853. The first English translation by Samuel Beal appeared in 1888. Only the first five chapters by Hui-li were complete; the five final chapters by Yen-Ts‘ung were summarised. In 1951, British Sinologist Arthur Waley summarised the historical career of Yuan Chwang from the '*Life'* and other sources in *The Real Tripitaka and other Pieces* (London, George Allen and Unwin Ltd., 1952). Mr. Li Yung-hsi was the first Chinese scholar to translate the *complete* ten chapters of '*Life'* into English; they were published in 1959 by The Chinese Buddhist Association, Peking, with a foreword by Venerable Chao Pu-chu. Mrs. D. Devahuti translated the correspondence of Yuan Chwang, Prajnadeva and Jnanaprabha from the Chinese of the '*Life*;' these

were published under the title *The Unknown Hsuan-tsang* (New Delhi, Oxford University Press, 2001).

Book II

Relates to Three Countries, viz, (I) Lan-po, (2) Na-Kie lo-ho and (3) Kien t'o-lo

1. Names of India

India is In-tu, the moon, because of its eminence:

On examination, we find that the names of India (T'ien-chu) are various and perplexing as to their authority. It was anciently called *Shin-tu*, also *Hien-tau*; but now, according to the right pronunciation, it is called *In-tu*. The people of *In-tu* call their country by different names according to their district. Each country has diverse customs. Aiming at a general name which is the best sounding, we will call the country *In-tu*. In Chinese this name signifies the moon. The moon has many names, of which this is one. For as it is said that all living things ceaselessly revolve in the wheel (of transmigration) through the long night of ignorance, without a guiding star, their case is like (*the world*), the sun gone down; as then the torch affords its connecting light, though there be the shining of the stars, how different from the bright (*cool*) moon; just so the bright connected light of holy men and sages, guiding the world as the shining of the moon, have made this country eminent, and so it is called *In-tu*.

Brahmins a noble caste:

The families of India are divided into castes, the Brahmans particularly (*are noted*) on account of their purity and nobility. Tradition has so hallowed the name of this tribe that there is no question as to difference of place, but the people generally speak of India as the country of the Brahmans (Po-lo-men).

2. Extent of India, Climate, & c

Accurate geography of India:

The countries embraced under this term of India are generally spoken of as the five Indies. In circuit this country is about 90,000 *li*; on three sides it is bordered by the great sea; on the north it is backed by the Snowy Mountains. The north part is broad, the southern part is narrow. Its shape is like the half-moon. The entire land is divided into seventy countries or so. The seasons are particularly hot; the land is well watered and humid. The north is a continuation of mountains and hills, the ground being dry and salt. On the east there are valleys and plains, which being well watered and cultivated, are fruitful and productive. The southern district is wooded and herbaceous; the western parts are stony and barren. Such is the general account of this country.

3. Measures of Length

To give a brief account of matters. In point of measurements, there is first of all the *yojana (yu-shen-na);* this from the time of the holy kings of old has been regarded as a day's march for an army. The old accents say it is equal to 40 *li*; according to the common reckoning in India it is 30 *li*, but in the sacred books (*of Buddha*) the *yojana* is only 16 *li*.

In the subdivision of distances, a *yojana* is equal to eight *krosas* (*keu-lu-she*); a *krosa* is the distance that the lowing of a cow can be heard; a *krosa* is divided into 500 bows (*dhanus*); a bow is divided into four cubits (*hastas*); a cubit is divided into 24 fingers (*angulis*); a finger is divided into seven barleycorns (*javas*); and so on to a louse (*yuka*), a nit (*liksha*), a dust grain, a cow's hair, a sheep's hair, a hare's down, copper-water,[315] and so on for seven divisions, till we come to a small grain of dust; this is divided sevenfold till we come to an excessively small grain of dust (*anu*); this cannot be divided further without arriving at nothingness, and so it is called the infinitely small (*paramanu*).

4. Astronomy, the Calendar, &c

Although the revolution of the Yin and Yang principles and the successive mansions of the sun and moon be called by names different from ours, yet the seasons are the same; the names of the months are derived from the position (*of the moon in respect*) of the asterisms.

The shortest portion of time is called a *t'sa-na* (*kshana*); 120 *kshanas* make *a ta-t'sa-na* (*takshana*); 60 of these make a *la-fo* (*lava*); 30 of these

make a *mau-hu-li-to* (*muthurta*); five of these make "a period of time" (*kala*); six of these make a day and night (*ahoratra*), but commonly the day and night are divided into eight *kalas*.[316]

The period from the new moon till full moon is called the white division (*Sukla-paksha*) of the month; the period from the full moon till the disappearance is called the dark portion (*Krishna-paksha*). The dark portion comprises fourteen or fifteen days, because the month is sometimes long and sometimes short. The preceding dark portion and the following light portion together form a month; six months form a "march" (*hing, s.ayana*). The sun when it moves within (*the equator*) is said to be on its northward march (*uttarayana*), when it moves without (*the equator*) it is on its southern march (*dakshinayana*). These two periods form a year (*vatsara*).

5. Towns and Buildings

The towns and villages have inner gates; the walls are wide and high; the streets and lanes are tortuous, and the roads winding. The thoroughfares are dirty and the stalls arranged on both sides of the road with appropriate signs. Butchers, fishers, dancers, executioners, and scavengers, and so on, have their abodes without the city. In coming and going these persons are bound to keep on the left side of the road till they arrive at their homes. Their houses are surrounded by low walls, and form the suburbs. The earth being soft and muddy, the walls are constructed of wood or bamboo; the houses have balconies and belvederes, which are made of wood, with a coating of lime or mortar, and covered with tiles. The different buildings have the same form as those in China: rushes, or dry branches, or tiles, or boards are used for covering them. The walls are covered with lime and mud, mixed with cow's dung for purity. At different seasons they scatter flowers about.

The *sangharamas* are constructed with extraordinary skill. A three-storeyed tower is erected at each of the four angles. The beams and the projecting heads are carved with great skill in different shapes. The doors, windows, and the low walls are painted profusely; the monks' cells are ornamental on the inside and plain on the outside. In the very middle of the building is the hall, high and wide. There are various storeyed chambers

and turrets of different height and shape, without any fixed rule. The doors open towards the east; the royal throne also faces the east.

6. Seats, Clothing, &c

When they sit or rest they all use mats; the royal family and the great personages and assistant officers use mats variously ornamented, but in size they are the same. The throne of the reigning sovereign is large and high, and much adorned with precious gems: it is called the Lion-throne (*simhasana*). It is covered with extremely fine drapery; the footstool is adorned with gems. The nobility use beautifully painted and enriched seats, according to their tastes.

7. Dress, Habits, &c

Their clothing is not cut or fashioned; they mostly affect fresh-white garments; they esteem little those of mixed colour or ornamented. The men wind their garments round their middle then gather them under the armpits, and let them fall down across the body, hanging to the right. The robes of the women fall down to the ground; they completely cover their shoulders. They wear a little knot of hair on their crowns, and let the rest of their hair fall loose. Some of the men cut off their moustaches, and have other odd customs. On their heads the people wear caps (*crowns*), with flower-wreaths and jewelled necklets. Their garments are made of *Kiau-she-ye* (*kauseya*) and of cotton. *Kiau-she-ye* is the product of the wild silkworm. They have garments also of *Ts'o-mo* (*kshauma*), which is a sort of hemp; garments also made of *Kien-po-lo* (*kambala*) which is woven from fine goat-hair; garments also made from the fine hair of a wild animal: it is seldom this can be woven, and therefore the stuff is very valuable, and it is regarded as fine clothing.

In North India, where the air is cold, they wear short and close-fitting garments, like the Hu people. The dress and ornaments worn by non-believers are varied and mixed. Some wear peacocks' feathers; some wear as ornaments necklaces made of skull bones (*Kapaladharinas*); some have no clothing, but go naked (*Nirgranthas*); some wear leaf or bark garments; some pull out their hair and cut off their moustaches; others have bushy whiskers and their hair braided on the top of their heads. The costume is not uniform, and the colour, whether red or white, not constant.

The Kshattriyas and the Brahmans are cleanly and wholesome in their dress, and they live in a homely and frugal way. The king of the country and the great ministers wear garments and ornaments different in their character. They use flowers for decorating their hair, with gem-decked caps; they ornament themselves with bracelets and necklaces.

There are rich merchants who deal exclusively in gold trinkets, and so on. They mostly go bare-footed; few wear sandals. They stain their teeth red or black; they bind up their hair and pierce their ears; they ornament their noses, and have large eyes. Such is their appearance.

8. Cleanliness, Ablutions, & c

They are very particularly in their personal cleanliness, and allow no remissness in this particular. All wash themselves before eating; they never use that which has been left over (*from a former meal*); they do not pass the dishes. Wooden and stone vessels, when used, must be destroyed; vessels of gold, silver, copper, or iron after each meal must be rubbed and polished. After eating they cleanse their teeth with a willow stick, and wash their hands and mouth.

Until these ablutions are finished they do not touch one another. Every time they perform the functions of nature they wash their bodies and use perfumes of sandal-wood or turmeric.

9. Writing, Language, Books, the Vedas, Study

Very acute observations:

The letters of their alphabet were arranged by Brahmadeva, and their forms have been handed down from the first till now. They are forty-seven in number, and are combined so as to form words according to the object, and according to circumstances (*of time or place*): there are other forms (*inflexions*) used. This alphabet has spread in different directions and formed diverse branches, according to circumstances; therefore there have been slight modifications in the sounds of the words (*spoken language*); but in its great features there has been no change. Middle India preserves the original character of the language in its integrity. Here the pronunciation is soft and agreeable, and like the language of the Devas. The pronunciation of the words is clear and pure, and fit as a model for all men. The people of

the frontiers have contracted several erroneous modes of pronunciation; for according to the licentious habits of the people, so also will be the corrupt nature of their language.

Contradicts the view that Indians have no sense of history and records:

With respect to the records of events, each province has its own official for preserving them in writing. The record of these events in their full character is called *Ni-lo-pi-ch'a* (*Nilapita*, blue deposit). In these records are mentioned good and evil events, with calamities and fortunate occurrences.

To educate and encourage the young, they are first taught to study the book of twelve chapters (*Siddhavastu*).[317]

After arriving at the age of seven years and upwards, the young are instructed in the five *Vidyas, Sastras* of great importance. The first is called the elucidation of sounds (*Sabdavidya*). This treatise explains and illustrates the agreement (*concordance*) of words, and it provides an index for derivatives.

The second vidya is called *Kiau-ming (Silpasthanavidya*); it treats of the arts, mechanics, explains the principles of the *Yin* and *Yang* and the calendar.

The third is called the medicinal treatise (*Chikitsavidya*); it embraces formulae for protection, secret charms, (use of) medicinal stones, acupuncture, and mugwort.

The fourth vidya is called the *Hetuvidya* (science of causes); its name is derived from the character of the work, which relates to the determination of the true and false, and reduces to their last terms the definition of right and wrong.

The fifth vidya is called the science of "the interior" (*Adhyatmavidya*); it relates to the five vehicles,[318] their causes and consequence, and the subtle influences of these.

The Brahmans study the four *Veda Sastras.* The first is called *Shau* (longevity); it relates to the preservation of life and the regulation of the natural condition. The second is called *Sse* (sacrifice); it relates to the (rules of) sacrifice and prayer. The third is called *Ping* (peace or regulation); it relates to decorum, casting of lots, military affairs, and army regulations.

The fourth is called *Shu* (secret mysteries); it relates to various branches of science, incantations, medicine.[319]

The teachers (*of these works*) must themselves have closely studied the deep and secret principles they contain, and penetrated to their remotest meaning. They then explain their general sense, and guide their pupils in understanding the words which are difficult. They urge them on and skilfully conduct them…

When they have finished their education, and have attained thirty years of age, then their character is formed and their knowledge ripe. When they have secured an occupation they first of all thank their master for this attention. There are some, deeply versed in antiquity, who devote themselves to elegant studies, and live apart from the world, and retain the simplicity of their character. These rise above mundane presents, and are as insensible to renown as to the contempt of the world. Their name having spread afar, rulers appreciate them highly, but are unable to draw them to the court. The chief of the country honours them on account of their (*mental*) gifts, and the people exalt their fame and render them universal homage. This is the reason of their devoting themselves to their studies with ardour and resolution, without any sense of fatigue. They search for wisdom, relying on their own resources. Although they are possessed of large wealth, yet they will wander here and there to seek their subsistence.

10. Buddhist Schools, Books, Discussions, Discipline

The different schools are constantly at variance, and their contending utterances rise like the angry waves of the sea. The different sects have their separate masters, and in various directions aim at one end.

There are Eighteen schools, each claiming pre-eminence. The partisans of the Great and Little Vehicle are content to dwell apart. There are some who give themselves up to quiet contemplation, and devote themselves, whether walking or standing still or sitting down, to the acquirement of wisdom and insight; others, on the contrary, differ from these in raising noisy contentions about their faith. According to their fraternity, they are governed by distinctive rules and regulations, which we need not name.

The *Vinaya (liu),* discourses (*lun*), *sutras* (*king*), are equally Buddhist books. He who can entirely explain one class of these books is exempted from the control of the *karmadana.* If he can explain two classes, he receives in addition the equipments of an upper seat (room); he who can explain three classes has allotted to him different servants to attend to and obey him; he who can explain four classes has "pure men" (*upasakas*) allotted to him as attendants; he who can explain five classes of books is then allowed an elephant carriage; he who can explain six classes of books is allowed a surrounding escort. When a man's renown has reached to a high distinction, then at different times he convokes an assembly for discussion. He judges of the superior or inferior talent of those who take part in it; he distinguishes himself by refined language, subtle investigation, deep penetration, and severe logic, then he is mounted on an elephant covered with precious ornaments, and conducted by a numerous suite to the gates of the convent.

If, on the contrary, one of the members breaks down in his argument, or uses poor and inelegant phrases, or if he violates a rule in logic and adapts his words accordingly, they proceed to disfigure his face with red and white, and cover his body with dirt and dust, and then carry him off to some deserted spot or leave him in a ditch. Thus they distinguish between the meritorious and the worthless, between the wise and the foolish.

11. Castes – Marriage

With respect to the division of families, there are four classifications. The first is called the Brahman (*Po-lo-men*), men of pure conduct. They guard themselves in religion, live purely, and observe the most correct principles. The second is called Kshattriya (*T'sa-ti-li*), the royal caste. For ages they have been the governing class: they apply themselves to virtue (*humanity*) and kindness. The third is called Vaisyas (*fei-she-li*), the merchant class: they engage in commercial exchange, and they follow profit at home and aboard. The fourth is called Sudra (*Shu-t'o-lo),* the agricultural class: they labour in ploughing and tillage. In these four classes purity or impurity of caste assigns to every one his place. When they marry they rise or fall in position according to their new relationship. They do not allow promiscuous marriages between relations. A woman once married can never take another husband. Besides these there are other classes of many

kinds that intermarry according to their several callings. It would be difficult to speak of these in detail.

12. Royal Family, Troops, Weapons

The succession of kings is confined to the Kshattriya (*T'sa-li*) caste, who by usurpation and bloodshed have from time to time raised themselves to power. Although a distinct caste, they are regarded as honourable (*or* lords).

The chief soldiers of the country are selected from the bravest of the people, and as the sons follow the profession of their fathers, they soon acquire a knowledge of the art of war. These dwell in garrison around the palace (*during peace*), but when on an expedition they march in front as an advanced guard. There are four divisions of the army, viz.-(1) the infantry, (2) the cavalry, (3) the chariots, (4) the elephants. The elephants are covered with strong armour, and their tusks are provided with sharp spurs. A leader in a car gives the command, whilst two attendants on the right and left drive his chariot, which is drawn by four horses abreast. The general of soldiers remains in his chariot; he is surrounded by a file of guards, who keep close to his chariot wheels.

The cavalry spread themselves in front to resist an attack, and in case of defeat they carry orders hither and thither. The infantry by their quick movements contribute to the defence. These men are chosen for their courage and strength. They carry a long spear and a great shield; sometimes they hold a sword or sabre, and advance to the front with impetuosity. All their weapons of war are sharp and pointed. Some of them are these – spears, shields, bows, arrows, swords, sabres, battle-axes, lances, halberds, long javelins, and various kinds of slings. All these they have used for ages.

13. Manners, Administration of Law, Ordeals

The integrity of ordinary folks:

With respect to the ordinary people, although they are naturally light-minded, yet they are upright and honourable. In money matters they are without craft, and in administering justice they are considerate. They dread the retribution of another state of existence, and make light of the things of the present world. They are not deceitful or treacherous in their conduct, and are faithful to their oaths and promises. In their rules of government

there is remarkable rectitude, whilst in their behaviour there is much gentleness and sweetness. With respect to criminals or rebels, these are few in number, and only occasionally troublesome. When the laws are broken or the power of the ruler violated, then the matter is clearly sifted and the offenders imprisoned. There is no infliction of corporal punishment; they are simply left to live or die, and are not counted among men. When the rules of propriety or justice are violated, or when a man fails in fidelity or filial piety, then they cut his nose or his ears off, or his hands and feet, or expel him from the country or drive him out into the desert wilds. For other faults, except these, a small payment of money will redeem the punishment. In the investigation of criminal cases there is no use of rod or staff to obtain proofs (*of guilt*). In questioning an accused person, if he replies with frankness the punishment is proportioned accordingly; but if the accused obstinately denies his fault, or in despite of it attempts to excuse himself, then in searching out the truth to the bottom, when it is necessary to pass sentence, there are four kinds of ordeal used (1) by water, (2) by force, (3) by weighing, (4) by poison.[320]

14. Medicines, Funeral Customs, & c

Every one who falls sick fasts for seven days. During this interval many recover, but if the sickness lasts they take medicine…

When a person dies, those who attend the funeral raise lamentable cries and weep together. They rend their garments and loosen their hair; they strike their heads and beat their breasts. There are no regulations as to dress for mourning, nor any fixed time for observing it.

There are three methods of paying the last tribute to the dead: (1) by cremation – wood being made into a pyre, the body is burnt; (2) by water – the body is thrown into deep flowing water and abandoned; (3) by desertion – the body is cast into some forest-wild, to be devoured by beasts.

In a house where there has been a death there is no eating allowed; but after the funeral they resume their usual (*habits*). There are no anniversaries (*of death*) observed. Those who have attended a death they consider unclean; they all bathe outside the town and then enter their houses.

The old and infirm who come near to death, and those entangled in a severe sickness, who fear to linger to the end of their days, and through

disgust wish to escape the troubles of life, or those who desire release from the trifling affairs of the world and its concerns, these after receiving a farewell meal at the hands of their relatives or friends, they place, amid the sounds of music, on a boat which they propel into the midst of the Ganges, where such persons drown themselves. They think thus to secure a birth among the Devas. Rarely one of these may be seen not yet dead on the borders (*of the river*).

The priests are not allowed to lament or cry for the dead; when a father or mother of a priest dies they recite their prayers, recounting their obligations to them; reflecting on the past, they carefully attend to them now dead. They expect by this to increase the mysterious character of their religious merit.

15. Civil Administration, Revenues, &c

As the administration of the government is founded on benign principles, the executive is simple. The families are not entered on registers, and the people are not subject to forced labour (*conscription*). The private demesnes of the crown are divided into four principal parts; the first is for carrying out the affairs of state and providing sacrificial offerings; the second is for providing subsidies for the ministers and chief officers of state; the third is for rewarding men of distinguished ability; and the fourth is for charity to religious bodies, whereby the field of merit is cultivated. In this way the taxes on the people are light, and the personal service required of them is moderate. Each one keeps his own worldly gods in peace, and all till the ground for their subsistence. Those who cultivate the royal estates pay a sixth part of the produce as tribute. The merchants who engage in commerce come and go in carrying out their transactions. The river-passages and the road-barriers are open on payment of a small toll. When the public works require it, labour is exacted but paid for. The payment is in strict proportion to the work done.

The military guard the frontiers, or go out to punish the refractory. They also mount guard at night round the palace. The soldiers are levied according to the requirements of the services; they are promised certain payments and are publicly enrolled. The governors, ministers, magistrates, and officials have each a portion of land consigned to them for their personal support.

16. Plants and Trees, Agriculture, Food, Drink, Cookery

The climate and the quality of the soil being different according to situation, the produce of the land is various in its character. The flowers and plants, the fruits and trees are of different kinds, and have distinct names.

It would be difficult to enumerate all the kinds of fruit… The pear (*Li*), the wild plum (*Nai*), the peach (*T'au*), the apricot (*Hang or Mui*), the grape (*Po-tau*), &c., these all have been brought from the country of Kashmir, and are found growing on every side.

On vegetables and meats consumed or forbidden:

In cultivating the land, those whose duty it is sow and reap, plough and harrow (*weed*), and plant according to the season; and after their labour they rest awhile. Among the products of the ground, rice and corn are most plentiful. With respect to edible herbs and plants, we may name ginger and mustard, melons and pumpkins, the *Heun-to (Kandu?)* plant, and others. Onions and garlic are little grown; and few persons eat them; if any one uses them for food, they are expelled beyond the walls of the town. The most usual food is milk, butter, cream, soft sugar, sugar-candy, the oil of the mustard-seed, and all sorts of cakes of corn are used as food. Fish, mutton, gazelle, and deer they eat generally fresh, sometimes salted; they are forbidden to eat the flesh of the ox, the ass, the elephant, the horse, the pig, the dog, the fox, the wolf, the lion, the monkey, and all the hairy kind. Those who eat them are despised and scorned, and are universally reprobated; they live outside the walls, and are seldom seen among men.

With respect to the different kind of wine and liquors, there are various sorts. The juice of the grape and sugarcane, these are used by the Kshattriyas as drink; the Vaisyas use strong fermented drinks; the Sramans and Brahmans drink a sort of syrup made from the grape or sugarcane, but not of the nature of fermented wine.

17. Commercial Transactions

Gold and silver, *teou-shih* (native copper), white jade, fire pearls (possibly amber), are the natural products of the country; there are besides these abundance of rare gems and various kinds of precious stones of different

names, which are collected from the islands of the sea. These they exchange for other goods; and in fact they always barter in their commercial transactions, for they have no gold or silver coins, pearl shells, or little pearls.[321]

BOOK III

TA-CH'A-SHI-LO (TAKSHASILA)

Land, people and legend:

The kingdom of *Ta-ch'a-shi-lo* is about 2000 *li* in circuit, and the capital is about 10 *li* in circuit. The royal family being extinct, the nobles contend for power by force. Formerly this country was in subjection to Kapisa, but latterly it has become tributary to *Kia-shi-mi-lo* (Kasmir). The land is renowned for its fertility, and produces rich harvests. It is very full of streams and fountains. Flowers and fruits are abundant. The climate is agreeably temperate. The people are lively and courageous, and they honour the three gems. Although there are many *sangharamas*, they have become ruinous and deserted, and there are very few priests; those that there are study the Great Vehicle.

To the north of the city 12 or 13 *li* is a *stupa* built by Asoka-raja. On feast-days (*religious commemoration days*) it glows with light, and divine flowers fall around it, and heavenly music is heard. According to tradition, we find in late times there was a woman whose body was grievously afflicted with leprosy. Coming to the *stupa* secretly, she offered worship in excess and confessed her faults. Then seeing that the vestibule (*open court before the stupa*) was full of dung and dirt, she removed it, and set to work to sweep and water it and to scatter flowers, she covered the ground with them. On this her evil leprosy left her, and her form became lovely, and her beauty doubled, whilst from her person there came the famed scent of the blue lotus, and this also is the reason of the fragrance of this excellent place. This is the spot where Tathagata formerly dwelt when he was practicing the discipline of a Bodhisattva; he was then the king of a great country and was called *Chen-ta-lo-po-la-po* (Chandraprabha); he cut off his head, earnestly

seeking the acquirement of Bodhi: and this he did during a thousand successive births, (*for the same object and in the same place*).[322]

Sang-ho-pu-lo(Simhapura)

On Svetambara and Digambara Jainas:

By the side of the *stupa*, and not far off, is the spot where the original teacher of the white-robed heretics arrived at the knowledge of the principles he sought, and first preached the law.[323] There is an inscription placed there to that effect. By the side of this spot is a temple of the Devas. The persons who frequent it subject themselves to austerities; day and night they use constant diligence without relaxation. The laws of their founder are mostly filched from the principles of the books of Buddha.[324] These men are of different classes, and select their rules and frame their precepts accordingly. The great ones are called Bhikshus; the younger are called Sramaneras. In their ceremonies and modes of life they greatly resemble the priests (*of Buddha*), only they have a little twist of hair on their heads, and they go naked (Digambara Jainas). Moreover, what clothes they chance to wear are white. Such are the slight differences which distinguish them from others. The figure of their sacred master (Mahavira) they stealthily class with that of Tathagata; it differs only in point of clothing;[325] the points of beauty are absolutely the same.

Kia-shi-mi-lo (Kasmir)

Land, people, Buddha and king Asoka:

The kingdom of Kasmir[326] is about 7000 *li* in circuit, and on all sides it is enclosed by mountains. These mountains are very high. Although the mountains have passes through them, these are narrow and contracted. The neighbouring states that have attacked it have never succeeded in subduing it. The capital of the country on the west side is bordered by a great river. It (*the capital*) is from north to south 12 or 13 *li*, and from east to west 4 or 5 *li*. The soil is fit for producing cereals, and abounds with fruits and flowers.

Here also are dragon-horses and the fragrant turmeric, the *fo-chu,* and medicinal plants.

The climate is cold and stern. There is much snow but little wind. The people wear leather doublets and clothes of white linen. They are light and frivolous, and of a weak, pusillanimous disposition. As the country is protected by a dragon, it has always assumed superiority among neighbouring people. The people are handsome in appearance, but they are given to cunning. They love learning and are well instructed. There are about 100 *sangharamas* and 5000 priests. There are four *stupas* built by Asoka-raja. Each of these has about a pint measure of relics of Tathagata. The history of the country says: This country was once a dragon lake. In old times the Lord Buddha was returning to the middle kingdom (*India*) after subduing a wicked spirit in *U-chang-na* (Udyana), and when in mid-air, just over this country, he addressed Ananda thus: "After my *Nirvana*, the Arhat Madhyantika will found a kingdom in this land, civilise (*pacify*) the people, and by his own effort spread abroad the law of Buddha."

In the hundredth year after the *Nirvana of* Tathagata, Asoka, king of Magadha, extended his power over the world, and was honoured even by the most distant people. He deeply reverenced the three gems, and had a loving regard for all living things. At this time there were 500 Arhats and 500 schismatical priests, whom the king honoured and patronised without any difference. Among the latter was a priest called Mahadeva, a man of deep learning and rare ability; in his retirement he sought a true renown; far thinking, he wrote treatises the principles of which were opposed to the holy doctrine. All who heard of him resorted to his company and adopted his views. Asoka-raja, not knowing either holy or common men,[327] and because he was naturally given to patronise those who were seditious, was induced to call together an assembly of priests to the banks of the Ganges, intending to drown them all.

At this time the Arhats having seen the danger threatening their lives by the exercise of their spiritual power flew away through the air and came to this country and concealed themselves among the mountains and valleys. Asoka-raja having heard of it, repented, and confessing his fault, begged them to return to their own country; but the Arhats refused to do so with

determination. Then Asoka-raja, for the sake of the Arhats, built 500 *sangharamas*, and gave this country as a gift to the priesthood.

Kanishka reorganises the scriptures:

In the four-hundredth year (about 75 AD) after the Nirvana of Tathagata, Kanishka, king of Gandhara, having succeeded to the kingdom, his kingly renown reached far, and he brought the most remote within his jurisdiction. During his intervals of duty he frequently consulted the sacred books of Buddha; daily he invited a priest to enter his palace and preach the law, but he found the different views of the schools so contradictory that he was filled with doubt, and he had no way to get rid of his uncertainty. At this time the honoured Parsva said, "Since Tathagata left the world many years and months have elapsed. The different schools hold to the treatises of their several masters. Each keeps to his own views, and so the whole body is torn by divisions."

The king having heard this,… said, "Though of no account personally, yet, thanks to the remnant of merit which has followed me through successive births since the time of the Holy One till now, I have come to my present state. I will dare to forget my own low degree, and hand down in succession the teaching of the law unimpaired. I will therefore arrange the teaching of the three *pitakas* of Buddha according to the various schools…"

Kanishka then summoned a holy assembly, but the multitudes that arrived made meaningful consultation virtually impossible. Eliminating the less learned and finally retaining only those who knew the three *Pitakas* and the five *vidyas*, he was left with 499 men. This assembly then deliberated upon the arrangement of the scriptures and composing the *Vibhasha Sastra.* Vasumitra, who was initially excluded from the deliberations, demonstrated his divine power, and was appointed president of the assembly.

These five hundred sages and saints first composed in ten myriads of verses the *Upadesa Sastra* to explain the *Sutra Pitaka*. Next they made in ten myriads of verses the *Vinaya Vibhasha Sastra* to explain the *Vinaya Pitaka*; and afterwards they made in ten myriad of verses the *Abhidharma Vibhasha Sastra* to explain the *Abhidharma Pitaka.* Altogether they composed thirty myriad of verses in six hundred and sixty myriad of words, which thoroughly explained the three *Pitakas*. There was no work of

antiquity to be compared with (*placed above*) their productions; from the deepest to the smallest questions, they examined all, explained all minute expressions, so that their work has become universally known and is the resource of all students who have followed them.

Kanishka-raja forthwith ordered these discourses to be engraved on sheets of red copper. He enclosed them in a stone receptacle, and having sealed this, he raised over it a *stupa* with the Scriptures in the middle. He commanded the Yakshas[328] to defend the approaches to the kingdom, so as not to permit the other sects to get these *sastras* and take them away, with the view that those dwelling in the country might enjoy the fruit of this labour.

BOOK IV

CHI-NA-PO-TI (CHINAPATI)[326]

Land, people, and King Kanishka and the Chinese hostages:

This country is about 2000 *li* in circuit. The capital is about 14 or 15 *li* round. It produces abundant harvests; the fruit trees are thinly scattered. The people are contented and peaceful; the resources of the country are abundant. The climate is hot and humid; the people are timid and listless. They are given to promiscuous study, and there are amongst them believers and the contrary. There are ten *sangharamas* and eight Deva temples.

Formerly, when Kanishka-raja was on the throne, his fame spread throughout the neighbouring countries, and his military power was recognised by all. The tributary princes to the west of the (*Yellow*) River, in recognition of his authority, sent hostages to him. Kanishka-raja having received the hostages, he treated them with marked attention. During the three seasons of the year he appointed them separate establishments, and afforded them special guards of troops. This country was the residence of the hostages during the winter. This is the reason why it is called Chinapati, after the name of the residence of the hostages.

There existed neither pear nor peach in this kingdom and throughout the Indies until the hostages planted them, and therefore the peach is called *Chinani,* and the pear is called *Chinarajaputra*.[329] For this reason the men

of this country have a profound respect for the Eastern land. Moreover (*when they saw me*) they pointed with their fingers, and said one to another, "This man is a native of the country of our former ruler."[330]

Three hundred years after the *Nirvana* of Buddha the master of *sastras* called Katyayana composed here the Fa-Chi-lun (*Abhidharmajnana-prasthana Sastra*).[331]

CHE-LAN-TO'-LO (JALANDHARA)

This kingdom is about 1000 *li* from east to west, and about 800 *li* from north to south. The capital is 12 or 13 *li* in circuit. The land is favourable for the cultivation of cereals, and it produces much rice. The forests are thick and umbrageous, fruits and flowers abundant. The climate is warm and moist, the people brave and impetuous, but their appearance is common and rustic. The houses are rich and well supplied. There are fifty convents, or so; about 2000 priests. They have students both of the Great and Little Vehicle. There are three temples of Devas and about 500 heretics, who all belong to the Pasupatas (ash-sprinkled).

K'IU-LU-TO (KULUTA)

Mineral wealth of Kulu district; land, people:

This country is about 3000 *li* in circuit, and surrounded on every side by mountains. The chief town is about 14 or 15 *li* round. The land is rich and fertile, and the crops are duly sown and gathered. Flowers and fruits are abundant, and the plants and trees afford a rich vegetation. Being contiguous to the Snowy Mountains, there are found here many medicinal (*roots*) of much value. Gold, silver, and copper are found here – fire-drops (*crystal*) and native copper (*teou*). The climate is unusually cold, and hail or snow continually falls. The people are coarse and common in appearance, and are much afflicted with goitre and tumours, their nature is hard and fierce; they greatly regard justice and bravery. There are about twenty *sangharamas,* and 1000 priests or so. They mostly study the Great Vehicle; a few practise (*the rules of)* other schools (*nikayas*). There are fifteen Deva temples: different sects occupy them without distinction.

Along the precipitous sides of the mountains and hollowed into the rocks are stone chambers which face one another. Here the Arhats dwell or the Rishis stop.

In the middle of the country is a *stupa* built by Asokaraja. Of old the Tathagata came to this country with his followers to preach the law and to save men. This *stupa* is a memorial of the traces of his presence.

SHE-TO-T'U-LU (SATADRU)[330]

Vegetable and mineral wealth; people; popularity of Buddha:

This country is about 2000 *li* from east to west, and borders on a great river. The capital is 17 or 18 *li* in circuit. Cereals grow in abundance, and there is very much fruit. There is an abundance of gold and silver found here, and precious stones. For clothing the people wear a very bright silk stuff; their garments are elegant and rich. The climate is warm and moist. The manners of the people are soft and agreeable; and men are docile and virtuous. The high and low take their proper place. They all sincerely believe in the law of Buddha and show it great respect. Within and without the royal city there are ten *sangharamas,* but the halls are now deserted and cold, and there are but few priests. To the south-east of the city 3 or 4 *li* is a *stupa* about 200 feet high, which was built by Asoka-raja. Besides it are the traces where the four past Buddhas sat or walked.

MO-T'U-LO (MATHURA)

Fruit trees, gold, cotton produce:

The kingdom of Mo-t'u-lo is about 5000 *li* in circuit. The capital is 20 *li* round. The soil is rich and fertile, and fit for producing grain. They give principal care to the cultivation of An-mo-lo (*trees*), which grow in clusters like forests. These trees, though called by one name, are of two kinds[332]; the small species, the fruit of which, when young, is green, and becomes yellow as it ripens; and the great species, the fruit of which is green throughout its growth.

This country produces a fine species of cotton fabric and also yellow gold. The climate is warm to a degree. The manners of the people are soft and

complacent. They like to prepare secret stores of religious merit. They esteem virtue and honour learning.

Viharas and stupas:

There are about twenty *sangharamas* with 2000 priests or so. They study equally the Great and the Little Vehicles. There are five Deva Temples, in which sectaries of all kinds live.

Reverencing the main Bodhisattvas:

There are three *stupas* built by Asoka-raja. There are very many traces (footprints) of the four past Buddhas here. There are also *stupas* to commemorate the remains of the holy followers of Sakya Tathagata, to wit, of Sariputra (*She-li-tseu*), of Mudgalaputra (*Mo-te-kia-lo-tseu*), of Purnamaitrayaniputra (*Pu-la-na-mei-ta-li-yen-ni-fo-ta-lo*), of Upali (*Yeu-po-li*), of Ananda (*O'-nan-to*), of Rahula (*Lo-hu-lo*), of Manjusri (*Man-chu-sse-li*), and *stupas* of other Bodhisattvas. Every year during the six fast-days of each month, the priests resort to these various *stupas* and pay mutual compliments; they make their religious offerings, and bring many rare and precious objects for presents. According to their school they visit the sacred object (*figure*) of their veneration. Those who study the *Abhidharma* honour Sariputra; those who practice meditation honour Mudgalaputra; those who recite the *sutras* honour Purnamaitrayaniputra; those who study the *Vinaya* reverence Upali. All the Bhikshunis honour Ananda, the *Sramaneras* (novice disciples) honour Rahula; those who study the Great Vehicle reverence the Bodhisattvas. On these days they honour the *stupas* with offerings. They spread out their jewelled banners; the rich coverings (*parasols*) are crowded together as network; the smoke of incense rises in clouds; and flowers are scattered in every direction like rain; the sun and the moon are concealed as by the clouds which hang over the moist valleys. The king of the country and the great ministers apply themselves to these religious duties with zeal.

SU-LO-KIN-NA (SRUGHNA)[332]

Devout nature of people:

This country is about 6000 *li* in circuit. On the eastern side it borders on the Ganges river, on the north it is backed by great mountains. The river Yamuna (*Chen-mu-na*) flows through its frontiers. The capital is about 20 *li* in circuit, and is bounded on the east by the river Yamuna. It is deserted, although its foundations are still very strong. As to produce of soil and character of climate, this country resembles the kingdom of *Sa-t'a-ni-shi-fa-lo* (Sthanesvara). The disposition of the people is sincere and truthful. They honour and have faith in heretical teaching, and they greatly esteem the pursuit of learning, but principally religious wisdom (or, wisdom that brings happiness).

There are five *sangharamas* with about 1000 priests; the greater number study the Little Vehicle; a few exercise themselves in other (*exceptional*) schools. They deliberate and discuss in appropriate language (*choice words*), and their clear discourses embody profound truth. Men of different regions of eminent skill discuss with them to satisfy their doubts. There are a hundred Deva temples with very many sectaries (*unbelievers*).

To the south-west of the capital and west of the river Yamuna is a *sangharama,* outside the eastern gate of which is a *stupa* built by Asoka-raja. The Tathagata, when in the world in former days, preached the law in this place to convert men. By its side is another *stupa* in which there are relics of the Tathagata's hair and nails. Surrounding this on the right and left are *stupa* enclosing the hair and nail relics of Sariputra and of *Mu-te-kia-lo* (Maudgalyayana) and other Arhats, several tens in number.

Decline of Buddhism after death of Buddha:

After Tathagata had entered *Nirvana* this country was the seat of heretical teaching. The faithful were perverted to false doctrine, and forsook the orthodox views.

Purity and power of the Ganga:

On the east of the Yamuna, going about 800 *li*, we come to the Ganges river. The source of the river (*or* the river at its source) is 3 or 4 *li* wide;[333] flowing south-east, it enters the sea, where it is 10 *li* and more in width. The water of the river is blue, like the ocean, and its waves are wide-rolling as the sea. The scaly monsters, though many, do no harm to men. The taste of

the water is sweet and pleasant, and sands of extreme fineness border its course. In the common history of the country this river is called *Fo-shwui*, the *river of religious merit* which can wash away countless sins. Those who are weary of life, if they end their days in it, are borne to heaven and receive happiness. If a man dies and his bones are cast into the river, he cannot fall into an evil way; whilst he is carried by its waters and forgotten by men, his soul is preserved in safety on the other side (other world).

MA-TI-PU-LO (MATIPURA)[334]

Devout people; Sudra king:

This country is about 6000 *li* in circuit; the capital is about 20 *li*. The soil is favourable for the growth of cereals, and there are many flowers and kinds of fruit. The climate is soft and mild. The people are sincere and truthful. They very much reverence learning, and are deeply versed in the use of charms and magic. The followers of truth and error (Buddhists and Brahmins) are equally divided. The king belongs to the caste of the Sudras (*Shu-t'o-lo*). He is not a believer in the law of Buddha, but reverences and worships the spirits of heaven. There are about twenty *sangharamas,* with 800 priests. They mostly study the Little Vehicle and belong to the schools of Sarvastivadas (*Shwo-i-tsie-yau*). There are some fifty Deva temples, in which men of different persuasions dwell promiscuously.

Natural wealth of Haridwar region; purity and renown of Ganga:

On the north-west frontier of this country, on the eastern shore of the river Ganges, is the town of *Mo-yu-lo*;[334] it is about 20 li in circuit. The inhabitants are very numerous. The pure streams of the river flow round it on every side; it produces native copper, pure crystal, and precious vases. Not far from the town, and standing by the Ganges river, is a great Deva temple, where very many miracles of divers sorts are wrought. In the midst of it is a tank, of which the borders are made of stone joined skilfully together. Through it the Ganges river is led by an artificial canal. The men of the five Indies call it "the gate of the Ganga river." This is where religious merit is found and sin effaced. There are always hundreds and thousands of people gathered together here from distant quarters to bathe

and wash in its waters. Benevolent kings have founded here "a house of merit" (*punyasala*). This foundation is endowed with funds for providing choice food and medicines to bestow in charity on widows and bereaved persons, on orphans and the destitute.

KIE-PI-THA (KAPITHA)

This country[335] is about 2000 *li* in circuit, and the capital 20 *li* or so… The manners of the people are soft and agreeable. The men are much given to learning. There are four *sangharamas* with about 1000 priests, who study the *Ching-liang* (Sammatiya) school of the Little Vehicle. There are ten Deva temples, where sectaries of all persuasions dwell. They all honour and sacrifice to Mahesvara (*Ta-tseu-t'sani-tien*).

Beauty and wealth of Buddhist sangharama:

To the east of the city 20 *li* or so is a great *sangharama* of beautiful construction, throughout which the artist has exhibited his greatest skill. The sacred image of the holy form (*of Buddha*) is most wonderfully magnificent. There are about 100 priests here, who study the doctrines of the Sammatiya school. Several myriads of "pure men" (*religious laymen*) live by the side of this convent.

Within the great enclosure of the *sangharama* there are three precious ladders, which are arranged side by side from north to south, with their faces for descent to the east. This is where Tathagata came down on his return from the Trayastrimsas heaven. In old days Tathagata, going up from the "wood of the conqueror" (*Shing-lin*, Jetavana), ascended to the heavenly mansions, and dwelt in the Saddharma Hall, preaching the law for the sake of his mother. Three months having elapsed, being desirous to descend to earth, Sakra, king of the Devas, exercising his spiritual power, erected these precious ladders. The middle one was of yellow gold, the left hand one of pure crystal, the right-hand one of white silver….

On the outside of the *vihara,* but close by its side, there is a stone column about 70 feet high which was erected by Asoka-raja (*Wu-yeu*). It is of a purple colour, and shining as if with moisture. The substance is hard and finely grained. Above it is a lion sitting on his haunches, and facing the ladder. There are carved figures inlaid, of wonderful execution, on the four

sides of the pillar and around it. As men are good or bad these figures appear on the pillar (*or disappear*).[336]

BOOK V

KIE-JO-KIO-SHE-KWO (KANYAKUBJA)

On the celebrated Siladitya Harsavardhana (606 or 610 – 650 AD):

The reigning king is of the Vaisya[337] caste. His name is Harsavardhan (*Ho-li-sha-fa-t'an-na*). A commission of officers hold the land. During two generations there have been three kings. (*The king's*) father was called *Po-lo-kie-lo-fa-t'an-na* (Prabhakaravardhan); his elder brother's name was Rajyavardhana (*Ho-lo-she-fa-t'an-na*).

Rajyavardhana came to the throne as the elder brother, and ruled with virtue. At this time the king of Karnasuvarna (*Kie-lo-na-su-fa-la-na*),[338] - a kingdom of Eastern India – whose name was Sasangka (*She-shangkia*),[339] frequently addressed his ministers in these words: "if a frontier country has a virtuous ruler, this is the unhappiness of the (*mother*) kingdom." On this they asked the king to a conference and murdered him.

The people having lost their ruler, the country became desolate. Then the great minister *Po-ni* (Bhandi),[340] whose power and reputation were high and of much weight, addressing the assembled, said, "The destiny of the nation is to be fixed today. The old king's son is dead: the brother of the prince, however, is humane and affectionate, and his disposition, heaven-conferred, is dutiful and obedient. Because he is strongly attached to his family, the people will trust in him. I propose that he assume the royal authority: let each one give his opinion on this matter, whatever he thinks." They were all agreed on this point, and acknowledged his conspicuous qualities.

On this the chief ministers and the magistrates all exhorted him to take authority… The prince replied, "The government of a country is a responsible office and ever attended with difficulties. The duties of a prince require previous consideration. As for myself, I am indeed of small eminence; but as my father and brother are no more, to reject the heritage of

the crown, that can bring no benefit to the people. I must attend to the opinion of the world and forget my own insufficiency. Now, therefore, on the banks of the Ganges there is a statue of Avalokitesvara Bodhisattva which has evidenced many spiritual wonders. I will go to it and ask advice (*request a response*)". [The prince accordingly visited the image]

The Bodhisattva replied, "In your former existence you lived in this forest as a hermit, and by your earnest diligence and unremitting attention your inherited a power of religious merit which resulted in your birth as a king's son. The king of the country, Karnasuvarna, has overturned the law of Buddha. Now when you succeed to the royal estate, you should in the same proportion exercise towards it the utmost love and pity. If you give your mind to compassionate the condition of the distressed and to cherish them, then before long you shall rule over the Five Indies. If you would establish your authority, attend to my instruction, and by my secret power you shall receive additional enlightenment, so that not one of your neighbours shall be able to triumph over you. Ascend not the lion-throne, and call not your self Maharaja."[341]

Siladitya avenges his brother's murder:

Having received these instructions, he departed and assumed the royal office. He called himself the King's Son (*Kumara*); his title was Siladitya. And now he commanded his ministers, saying, "The enemies of my brother are unpunished as yet, the neighbouring countries not brought to submission; while this is so my right hand shall never lift food to my mouth. Therefore do you, people and officers, unite with one heart and put out your strength". Accordingly they assembled all the soldiers of the kingdom, summoned the masters of arms. They had a body of 5000 elephants, a body of 2000 cavalry, and 50,000 foot-soldiers. He went from east to west subduing all who were not obedient; the elephants were not unharnessed nor the soldiers unbelted (*unhelmeted*). After six years he had subdued the Five Indies. Having thus enlarged his territory, he increased his forces; he had 60,000 war elephants and 100,000 cavalry. After thirty years his arms reposed, and he governed everywhere in peace. He then practiced to the utmost the rules of temperance, and sought to plant the tree of religious merit to such an extent that he forgot to sleep or to eat. He forbade

the slaughter of any living thing or flesh as food throughout the Five Indies on pain of death without pardon. He built on the banks of the river Ganges several thousand *stupas,* each about 100 feet high; in all the highways of the towns and villages throughout India he erected hospices, provided with food and drinks, and stationed there physicians, with medicines for travellers and poor persons round about, to be given without any stint. On all spots where there were holy traces (*of Buddha*) he raised *sangharamas.*

Siladitya hosts a great religious assembly:

Once in five years he held the great assembly called Moksha. He emptied his treasuries to give all away in charity, only reserving the soldiers' arms, which were unfit to give as alms. Every year he assembled the *Sramanas* from all countries, and on the third and seventh days he bestowed on them in charity the four kinds of alms (viz., food, drink, medicine, clothing). He decorated the throne of the law (*the pulpit*) and extensively ornamented (*arranged*) the oratories.[342] He ordered the priests to carry on discussions, and himself judged of their several arguments, whether they were weak or powerful. He rewarded the good and punished the wicked, degraded the evil and promoted the men of talent. If any one (*priest*) walked according to the moral precepts, and was distinguished in addition for purity in religion (*reason*), he himself conducted such a one to "*the lion-throne*" and received from him the precepts of the law. If any one, though distinguished for purity of life, had no distinction for learning, he was reverenced, but not highly honoured. If any one disregarded the rules of morality and was notorious for his disregard of propriety, him he banished from the country, and would neither see him nor listen to him. If any of the neighbouring princes or their chief ministers lived religiously, with earnest purpose, and aspired to a virtuous character without regarding labour, he led him by the hand to occupy the same seat with himself, and called him "illustrious friend;" but he disdained to look upon those of a different character. If it was necessary to transact state business, he employed couriers who continually went and returned. If there was any irregularity in the manners of the people of the cities, he went amongst them.

Wherever he moved he dwelt in a readymade building[343] during his sojourn. During the excessive rains of the three months of the rainy season

he would not travel thus. Constantly in his travelling-palace he would provide choice meats for men of all sorts of religion.[344] The Buddhist priests would be perhaps a thousand; the Brahmans, five hundred. He divided each day into three portions. During the first he occupied himself on matters of government; during the second he practiced himself in religious devotion without interruption, so that the day was not sufficiently long. When I first received the invitation of Kumara-raja, I said I would go from Magadha to Kamarupa.[345] At the time Siladitya-raja was visiting different parts of his empire, and found himself at *Kie-mi-ou-ki-lo*,[346] when he gave the following order to Kumara-raja: "I desire you to come at once to the assembly with the strange *Sramana* you are entertaining at the Nalanda convent." On this, coming with Kumara-raja, we attended the assembly. The king, Siladitya, after the fatigue of the journey was over, said, "From what country do you come, and what do you seek in your travels?"

Yuan Chwang meets Siladitya and discusses his own country:

He said in reply, "I come from the great Tang country, and I ask permission to seek for the law (*religious books*) of Buddha."

The king said, "Whereabouts in the great Tang country? By what road do you travel? And is it far from this, or near?"

In reply he said, "My country lies to the north-east from this several myriads of *li*; it is the kingdom which in India is called Mahachina".

The king answered, "I have heard that the country of Mahachina has a king called *Ts'in*,[347] the son of heaven, when young distinguished for his spiritual abilities, when old then (called) 'divine warrior.' The empire in former generations was in disorder and confusion, everywhere divided and in disunion; soldiers were in conflict, and all the people were afflicted with calamity. Then the king of *Ts'in*, son of heaven, who had conceived from the first vast purposes, brought into exercise all his pity and love; he brought about a right understanding, and pacified and settled all within the seas. His laws and instruction spread on every side. People from other countries brought under his influence declared themselves ready to submit to his rule. The multitude whom he nourished generously sang in their

songs of the prowess of the king of *Ts'in*. I have learned long since his praises sung thus in verse. Are the records (*eulogies*) of his great qualities well founded? Is this the king of the great Tang, of which you speak?"

Replying, he said, "China is the country of our former kings, but the 'great Tang' is the country of our present ruler. Our king in former times, before he became hereditary heir to the throne (*before the empire was established*), was called the sovereign of *Ts'in*, but now he is called the 'king of heaven' (*emperor*). At the end of the former dynasty[348] the people had no ruler, civil war raged on every hand and caused confusion, the people were destroyed, when the king of *Ts'in*, by his supernatural gifts, exercised his love and compassion on every hand; by his power the wicked were destroyed on every side, the eight regions found rest, and the ten thousand kingdoms brought tribute. He cherished creatures of every kind, submitted with respect to the three precious ones.[349] He lightened the burdens of the people and mitigated punishment, so that the country abounded in resources and the people enjoyed complete rest. It would be difficult to recount all the great changes he accomplished."

Siladitya-raja replied, "Very excellent indeed! The people are happy in the hands of such a holy king."

The religious assembly of kings and holy men of 20 countries:

Siladitya-raja being about to return to the city of Kanyakubja, convoked a religious assembly. Followed by several hundreds of thousand people, he took his place on the southern bank of the river Ganges, whilst Kumara-raja, attended by several tens of thousands took his place on the northern bank, and thus, divided by the stream of the river, they advanced on land and water. The two kings led the way with their gorgeous staff of soldiers (*of the four kinds*); some also were in boats; some were on elephants; sounding drums and blowing horns, playing on flutes and harps. After ninety days they arrived at the city of Kanyakubja, (*and rested*) on the western shore of the Ganges river, in the middle of a flowery copse.

Then the kings of the twenty countries who had received instruction from Siladitya-raja assembled with the Sramanas and Brahmans, the most distinguished of their country, with magistrates and soldiers. The king in advance had constructed on the west side of the river a great *sangharama,*

and on the east of this a precious tower about 100 feet in height; in the middle he had placed a golden statue of Buddha, of the same height as the king himself. On the south of the tower he placed a precious altar, in the place for washing the image of Buddha. From this north-east 14 or 15 *li* he erected another rest-house. It was now the second month of spring-time; from the first day of the month he had presented exquisite food to the Sramanas and Brahmans till the 21st day; all along, from the temporary palace to the *sangharama,* there were highly decorated pavilions, and places where musicians were stationed, who raised the sounds of their various instruments. The king, on leaving the resting-hall (*palace of travel*), made them bring forth on a gorgeously caparisoned great elephant a golden statue of Buddha about three feet high, and raised aloft. On the left went the king, Siladitya, dressed as Sakra, holding a precious canopy, whilst Kumara-raja, dressed as Brahma-raja, holding a white *chamara,* went on the right. Each of them had as an escort 500 war-elephants clad in armour; in front and behind the statue of Buddha went 100 great elephants, carrying musicians, who sounded their drums and raised their music. The king, Siladitya, as he went, scattered on every side pearls and various precious substances, with gold and silver flowers, in honour of the three precious objects of worship. Having first washed the image in scented water at the altar, the king then himself bore it on his shoulder to the western tower, where he offered to it tens, hundreds, and thousands of silken garments, decorated with precious gems. At this time there were but about twenty Sramanas following in the procession, the kings of the various countries forming the escort. After the feast they assembled the different men of learning, who discussed in elegant language on the most abstruse subjects. At evening-tide the king retired in state to his palace of travel.

Siladitya quenches a fire with his personal merit:

Thus every day he carried the golden statue as before till at length on the day of separation a great fire suddenly broke out in the tower, and the pavilion over the gate of the *sangharama* was also in flames. Then the king exclaimed, “I have exhausted the wealth of my country in charity, and following the example of former kings, I have built this *sangharama,* and I have aimed to distinguish myself by superior deeds, but my poor attempts

(*feeble qualities*) have found no return! In the presence of such calamities as these, what need I of further life?"

Then with incense-burning he prayed, and with this vow, "Thanks to my previous merit, I have come to reign over all India; let the force of my religious conduct destroy this fire; or if not, let me die!" Then he rushed headlong towards the threshold of the gate, when suddenly, as if by a single blow, the fire was extinguished and the smoke disappeared.

The kings beholding the strange event were filled with redoubled reverence; but he (*the king),* with unaltered face and unchanged accents, addressed the princes thus: "The fire has consumed this crowning work of my religious life. What think you of it?"

The princes, prostrate at his feet, with tears, replied "The work which marked the crowning act of your perfected merit, and which we hoped would be handed down to future ages, has in a moment been reduced to ashes. How can we bear to think of it? But how much more when the heretics are rejoicing thereat, and interchanging their congratulations!"

The king answered, "By this, at least, we see the truth of what Buddha said; the heretics and others insist on the permanency of things, but our great teachers' doctrine is that all things are impermanent. As for me, my work of charity was finished, according to my purpose; and this destructive calamity does but strengthen my knowledge of the truth of Tathagata's doctrine. This is a great happiness (*good fortune*), and not a subject for lamentation."

Attempt on the life of Siladitya; banishment of 500 brahmins:

On this, in company with the kings, he went to the east, and mounted the great *stupa*. Having reached the top, he looked around on the scene, and then descending the steps, suddenly a heretic (or stranger), knife in hand, rushed on the king. The king, startled at the sudden attack, stepped back a few steps up the stairs, and then bending himself down he seized the man, in order to deliver him to the magistrates. The officers were so bewildered with fright that they did not known how to move for the purpose of assisting him.

The kings all demanded that the culprit should be instantly killed, but Siladitya raja, without the least show of fear and with unchanged

countenance, commanded them not to kill him; and then he himself questioned him thus:

"What harm have I done you, that you have attempted such a deed?"

The culprit replied, "Great king! Your virtues shine without partiality; both at home and abroad they bring happiness. As for me, I am foolish and besotted, unequal to any great undertaking; led astray by a single word of the heretics, and flattered by their importunity, I have turned as a traitor against the king."

The king then asked, "And why have the heretics conceived this evil purpose?"

He answered and said, "Great king! you have assembled the people of different countries, and exhausted your treasury in offerings to the Sramanas, and cast a metal image of Buddha; but the heretics who have come from a distance have scarcely been spoken to. Their minds, therefore, have been affected with resentment, and they procured me, wretched man that I am! to undertake this unlucky deed."

The king then straightly questioned the heretics and their followers. There were 500 Brahmans, all of singular talent, summoned before the king. Jealous of the Sramans, whom the king had reverenced and exceedingly honoured, they had caused the precious tower to catch fire by means of burning arrows, and they hoped that in escaping from the fire the crowd would disperse in confusion, and at such a moment they proposed to assassinate the king. Having been foiled in this, they had bribed this man to lay wait for the king in a narrow passage and kill him.

Then the ministers and the kings demanded the extermination of the heretics. The king punished the chief of them and pardoned the rest. He banished the 500 Brahmans to the frontiers of India, and then returned to his capital.

PO-LO-YE-KIA (PRAYAGA)

Buddha has few followers in Prayaga:

This country (modern Allahabad) is about 5000 *li* in circuit, and the capital, which lies between two branches of the river, is about 20 *li* round. The grain products are very abundant, and fruit-trees grow in great

luxuriance. The climate is warm and agreeable; the people are gentle and compliant in their disposition. They love learning, and are very much given to heresy.

There several Deva temples; the number of heretics is very great.

To the south-west of the capital, in a Champaka (*Chen-po-kia*) grove, is a *stupa* which was built by Asoka-raja; although the foundations have sunk down, yet the walls are more than 100 feet high. Here it was in old days Tathagata discomfited the heretics. By the side of it is a *stupa* containing hair and nail relics, and also a place where (*past Buddhas?*) sat and walked.

On the powers of a Hindu temple:

In the city there is a Deva temple beautifully ornamented and celebrated for its numerous miracles. According to their records, this place is a noted one (*sri – fortunate ground*) for all living things to acquire religious merit.

If in this temple a man gives a single farthing, his merit is greater than if he gave a 1000 gold pieces elsewhere. Again, if in this temple a person is able to contemn life so as to put an end to himself, then he is born to eternal happiness in heaven.

Before the hall of the temple there is a great tree[350] with spreading boughs and branches, and casting a deep shadow. There was a body-eating demon here, who, depending on this custom (*of committing suicide*), made his abode here; accordingly on the left and right one sees heaps of bones. Hence, when a person comes to this temple, there is everything to persuade him to despise his life and give it up: he is encouraged thereto both by the promptings of the heretics and also by the seductions of the (*evil)* spirit. From very early days till now this false custom has been practiced…

The charity enclosure of Prayaga, where Siladitya made generous endowments:

To the east of the capital, between the two confluents of the river, for the space of 10 *li* or so, the ground is pleasant and upland. The whole is covered with a fine sand. From old times till now, the kings and noble families, whenever they had occasion to distribute their gifts in charity, ever came to this place, and here gave away their goods; hence it is called *the great charity enclosure.* At the present time Siladitya-raja, after the example

of his ancestors, distributes here in one day the accumulated wealth of five years. Having collected in this space of the *charity enclosure* immense piles of wealth and jewels, on the first day he adorns in a very sumptuous way a statue of Buddha, and then offers to it the most costly jewels. Afterwards to the priests who are present; afterwards to the heretics who live in the place, following the ways of the world; and lastly, to the widows and bereaved, orphans and desolate, poor and mendicants.

Thus, according to this order, having exhausted his treasuries and given food in charity, he next gives away his head diadem and his jewelled necklaces. From the first to the last he shows no regret, and when he has finished he cries with joy, "Well done! Now all that I have has entered into incorruptible and imperishable treasuries."

After this the rulers of the different countries offer their jewels and robes to the king, so that his treasury is replenished.

Voluntary death in the Prayaga; even animals bathe and die:

To the east of the *enclosure of charity,* at the confluence of the two rivers, every day there are many hundreds of men who bathe themselves and die. The people of this country consider that whoever wishes to be born in heaven ought to fast to a grain of rice, and then drown himself in the waters. By bathing in this water (they say) all the pollution of sin is washed away and destroyed; therefore from various quarters and distant regions people come here together and rest. During seven days they abstain from food, and afterwards end their lives. And even the monkeys and mountain stags assemble here in the neighbourhood of the river, and some of them bathe and depart, others fast and die…

Ascetic practices in Prayaga:

The heretics who practice asceticism have raised a high column in the middle of the river; when the sun is about to go down they immediately climb up the pillar; then clinging on to the pillar with one hand and one foot, they wonderfully hold themselves out with one foot and one arm; and so they keep themselves stretched out in the air with their eyes fixed on the sun, and their heads turning with it to the right as it sets. When the evening has darkened, then they come down. There are many dozens of ascetics

who practice this rite. They hope by these means to escape from birth and death, and many continue to practice this ordeal through several decades of years.

KIAU-SHANG-MI (KAUSAMBI)

Another predominantly Hindu region visited by the pilgrim:

This country[351] is about 6000 *li* in circuit, and the capital about 30 *li*. The land is famous for its productiveness; the increase is very wonderful. Rice and sugarcanes are plentiful. The climate is very hot, the manners of the people hard and rough. They cultivate learning and are very earnest in their religious life and in virtue. There are ten *sangharamas,* which are in ruins and deserted; the priests are about 300; they study the Little Vehicle. There are fifty Deva temples, and the number of heretics is enormous.

In the city, within an old palace, there is a large *vihara* about 60 feet high; in it is a figure of Buddha carved out of sandal-wood, above which is a stone canopy. It is the work of the king *U-to-yen-na* (Udayana). By its spiritual qualities it produces a divine light, which from time to time shines forth. The princes of various countries have used their power to carry off this statue, but although many men have tried, not all the number could move it. They therefore worship copies of it, and they pretend that the likeness is a true one, and this is the original of all such figures.

When Tathagata first arrived at complete enlightenment, he ascended up to heaven to preach the law for the benefit of his mother, and for three months remained absent. This king (Udayana), thinking of him with affection, desired to have an image of his person; therefore he asked Mudgalyayanaputra, by his spiritual power, to transport an artist to the heavenly mansions to observe the excellent marks of Buddha's body, and carve a sandal-wood statue. When Tathagata returned from the heavenly palace, the carved figure of sandal-wood rose and saluted the Lord of the World. The Lord then graciously addressed it and said, "The work expected from you is to toil in the conversion of heretics, and to lead in the way of religion future ages."

To the south-west of the city 8 or 9 *li* is a stone dwelling of a venomous Naga. Having subdued this dragon, Tathagata left here his shadow; but

though this is a tradition of the place, there is no vestige of the shadow visible.

The law of Sakya becoming extinct, this will be the very last country in which it will survive; therefore from the highest to the lowest all who enter the borders of this country are deeply affected, even to tears, ere they return.

BUDDHIST RECORDS OF THE WESTERN WORLD, VOL. II.

BOOK VI

SHI-LO-FU-SHI-TI (SRAVASTI)

A great city in ruin:

The kingdom of Sravasti (*Shi-lo-fu-shi-ti*)[352] is about 6000 *li* in circuit. The chief town is desert and ruined. There is no record as to its exact limits. The ruins of the walls encompassing the royal precincts give a circuit of about 20 *li*. Though mostly in ruins, still there are a few inhabitants. Cereals grow in great abundance; the climate is soft and agreeable, the manners of the people are honest and pure. They apply themselves to learning, and love religion (*merit*). There are several hundreds of *sangharamas,* mostly in ruin, with very few religious followers, who study the books of the Sammatiya school. There are 100 Deva temples with very many heretics. When Tathagata was in the world, this was the capital of the country governed by Prasenajita-raja (*Po-lo-si-na-chi-to-wang*)…

Buddha's subdues the criminal, Angulimalya:

By the side of the house of Sudatta is a great *stupa.* This is the place where the Angulimalya (*Yang-kiu-li-mo-lo*) gave up his heresy. The Angulimalyas are the unlucky caste (*criminals*) of Sravasti. They kill everything that lives, and maddening themselves, they murder men in the towns and country, and make chaplets for the head of their fingers. The man in question wished to kill his mother to complete the number of fingers, when the Lord of the World (Buddha), moved by pity, went to him to

convert him. Beholding the Lord from far, the Angulimalya rejoicing said, "Now I shall be born in heaven; our former teacher declared that whoever injuries a Buddha or kills his mother, ought to be born in the Brahma heaven".

Addressing his mother, he said, "Old woman! I will leave you for a time till I have killed that great Shaman." Then taking a knife, he went to attack the Lord. On this Tathagata stepped slowly as he went, whilst the Angulimalya rushed at him without slacking his pace.

The Lord of the World addressing him said, "Why do you persevere in your evil purpose and give up the better feelings of your nature and foster the source of evil?" The Angulimalya, hearing these words, understood the wickedness of his conduct, and on that paid reverence to Buddha, and sought permission to enter the law (*of Buddha*), and having persevered with diligence in his religious progress, he obtained the fruit of an Arhat.

KIE-PI-LO-SSE-TI (KAPILAVASTU)

Buddha's birthplace in ruin; Yuan Chwang visits the spot where he met his father after his Enlightenment:

This country[353] is about 4000 *li* in circuit. There are some ten desert cities in this country, wholly desolate and ruined. The capital is overthrown and in ruins. Its circuit cannot be accurately measured. The royal precincts within the city measure some 14 or 15 *li* round. They were all built of brick. The foundation walls are still strong and high. It has been long deserted. The peopled villages are few and waste.

To the south of the city 3 or 4 *li* is a grove of Nyagrodha trees in which is a *stupa* built by Asoka-raja. This is the place where Sakya Tathagata, having returned to his country after his enlightenment, met his father and preached the law. Suddhodana-raja, knowing that Tathagata had defeated Mara and was engaged in travelling about, leading people to the truth and converting them, was moved by a strong desire to see him, and considered how he could pay him the reverence due to him. He therefore sent a messenger to invite Tathagata, saying, "Formerly you promised, when you had completed your purpose to become a Buddha, to return to your native place. These are your words still unperformed; now then is the time for you

to condescend to visit me." The messenger having come to the place where Buddha was, expressed to him the king's desire. Tathagata in reply said, "After seven days I will return to my native place." The messenger returning, acquainted the king with the news, on which Suddhodana-raja ordered his subjects to prepare the way by watering and sweeping it, and to adorn the road with incense and flowers; and then, accompanied by his officers of state, he proceeded 40 *li* beyond the city, and there drew up his chariot to wait his arrival. Then Tathagata with a great multitude advanced; the eight Vajrapanis surrounded him as an escort, the four heavenly kings went before him; divine Sakra, with a multitude of Devas belonging to the world of desires (*Kama-loka*), took their place on the left hand; Brahma-raja with Devas of *Rupa-loka* accompanied him on the right. The Bhikshu priests walked in order behind, Buddha by himself, as the full moon among the stars, stood in the midst; his supreme spiritual presence shook the three worlds, the brightness of his person exceeded that of the seven lights; and thus traversing the air he approached his native country. The king and ministers having reverenced him, again returned to the kingdom, and they located themselves in the Nyagrodha grove.

KIU-SHI-NA-K'IE-LO (KUSINAGARA)

Yuan Chwang visits the place of Buddha's *pari-nirvana*:

The capital[354] of this country is in ruins, and its towns and villages waste and desolate...

To the north-west of the city 3 or 4 *li*, crossing the Ajitavati (Hiranyavati) (*O-shi-to-fa-ti*) river, on the western bank not far, we come to a grove of *sala* trees. The *sala* tree is like the *Huh* tree, with a greenish white bark and leaves very glistening and smooth. In this wood are four trees of an unusual height, which indicate the place where Tathagata died.[355]

There is (*here*) a great brick *vihara,* in which is a figure of the *Nirvana* of Tathagata. He is lying with his head to the north as if asleep. By the side of this *vihara* is a *stupa* built by Asoka-raja; although in a ruinous state, yet it is some 200 feet in height. Before it is a stone pillar to record the *Nirvana* of Tathagata; although there is an inscription on it, yet there is no date as to year or month…

Buddha's last disciple:

To the west of this place, not far off, is a *stupa*. This is where Subhadra (*Shen-hien*) died (*entered Nirvana*). Subhadra was originally a Brahman teacher. He was 120 years of age; being so old, he had acquired in consequence much wisdom. Hearing that Buddha was about to die, he came to the two (*sala*) trees, and asked Ananda, saying, "The Lord is about to die; pray let me ask him respecting some doubts I have, which still hamper me." Ananda replied, "The Lord is about to die; pray do not trouble him." He said, "I hear that Buddha is difficult to meet in the world, and that the true law is difficult to hear. I have some grave doubts; there is no ground for fear." On being invited, Subhadra at once entered, and first asked Buddha, "There are many different persons who call themselves masters, each having a different system of doctrine, and pretending therewith to guide the people. Is Gautama (*Kiu-ta-mo*) able to fathom their doctrine?" Buddha said, "I know their doctrine thoroughly;" and then for Subhadra's sake he preached the law.

Subhadra having heard (*the sermon*), his mind, pure and faithful, found deliverance, and he asked to be received into the church as a fully ordained disciple. Then Tathagata addressed him saying, "Are you able to do so? Unbelievers and other sectaries who prepare themselves for a pure mode of life ought to pass a four years' novitiate, to exhibit their conduct and test their disposition; if their characters and words be unexceptionable, then such persons may enter my profession; but in your case, whilst living amongst men, you have observed their discipline. There should be no difficulty, then, to prevent your full ordination."

Subhadra said, "The Lord is very pitiful and very gracious, without any partiality. Is he then willing to forego in my case the four years of the threefold preparatory discipline?"[356]

Buddha said, "As I before stated, this has been done whilst living among men."

Then Subhadra, leaving his home immediately, took full orders as a priest. Then applying himself with all diligence, he vigorously disciplined both body and mind, and so being freed from all doubt, in the middle of the night (*of Buddha's Nirvana*), not long after (*the meeting*), he obtained the fruit, and became an Arhat without any imperfection. Being thus perfected in

purity, he could not bear to await Buddha's death (*Nirvana*), but in the midst of the congregation, entering the *samadhi* of "fire-limit" (*Agni-dhatu*), and after displaying his spiritual capabilities, he first entered *Nirvana*. He was thus the very last convert of Tathagata, and the first to enter *Nirvana.*

BOOK VII

P'O-LO-NI-SSE (VARANASI)

Wealth and culture and Varanasi Hindus:

This country is about 4000 *li* in circuit. The capital borders (*on its western side*) the Ganges river. It is about 18 or 19 *li* in length and 5 or 6 *li* in breadth; its inner gates are like a small-toothed comb; it is densely populated. The families are very rich, and in the dwellings are objects of rare value. The disposition of the people is soft and humane, and they are earnestly given to study. They are mostly unbelievers, a few reverence the law of Buddha. The climate is soft, the crops abundant, the trees (*fruit trees*) flourishing, and the underwood thick in every place. There are about thirty *sangharamas* and 3000 priests. They study the Little Vehicle according to the Sammatiya school. There are a hundred or so Deva temples with about 10,000 sectaries. They honour principally Mahesvara (*Ta-tseu-tsai*). Some cut their hair off, others tie their hair in a knot, and go naked, without clothes (*Nirgranthas*); they cover their bodies with ashes (*Pasupatas*), and by the practice of all sorts of austerities they seek to escape from birth and death.

In the capital there are twenty Deva temples, the towers and halls of which are of sculptured stone and carved wood. The foliage of trees combine to shade (*the sites*), whilst pure streams of water encircle them. The statue of the Deva Mahesvara, made of *teou-shih* (*native copper*), is somewhat less than 100 feet high. Its appearance is grave and majestic, and appears as though really living.

Stupas of the city:

To the north-east of the capital, on the western side of the river Varana, is a *stupa* built by Asoka-raja (*Wu-yau*). It is about 100 feet high; in front of it is a stone pillar; it is bright and shining as a mirror; its surface is glistening and smooth as ice, and on it can be constantly seen the figure of Buddha as a shadow.

To the north-east of the river Varana about 10 *li* or so, we come to the *sangharama* of *Lu-ye* (Deer Park). Its precincts are divided into eight portions connected by a surrounding wall. The storeyed towers with projecting eaves and the balconies are of very superior work. There are fifteen hundred priests in the convent who study the Little Vehicle according to the Sammatiya school. In the great enclosure is a *vihara* about 200 feet high; above the roof is a golden-covered figure of the Amra (*An-mo-lo*, mango) fruit. The foundations of the building are of stone, and the stairs also, but the towers and niches are of brick. The niches are arranged on the four sides in a hundred successive lines, and in each niche is a golden figure of Buddha. In the middle of the *vihara* is a figure of Buddha made of *teou-shih* (*native copper*). It is the size of life and he is represented as turning the wheel of the law (*preaching*).

FEI-SHE-LI (VAISALI)

Yuan Chwang noticed different groups living peacefully everywhere:

This kingdom (Vrijji) is about 5000 *li* in circuit.[357] The soil is rich and fertile; flowers and fruits are produced in abundance. The *amra* fruit (mango) and the *mocha* (banana) are very plentiful and much prized. The climate is agreeable and temperate. The manners of the people are pure and honest. They love religion and highly esteem learning. Both heretics and believers are found living together. There are several hundred *sangharamas,* which still remain have but few priests in them. There are several tens of Deva temples, occupied by sectaries of different kinds. The followers of the Nirgranthas are very numerous.

The capital city of Vaisali is to a great extent in ruins. Its old foundations are from 60 to 70 *li* in circuit. The royal precincts are about 4 or 5 *li* round: there are a few people living in it. North-west of the royal city (*precincts*) 5

or 6 *li*, is a *sangharama* with a few disciples. They study the teaching of the Little Vehicle, according to the Sammatiya school.

Amrapalli's house:

Not far from this is a *stupa;* this is the old house of the lady Amra (courtesan Amrapalli). It was here the aunt of Buddha and other Bhikshunis obtained Nirvana.

Buddha prepares to take leave of the world:

To the north of the *sangharama* 3 or 4 *li* is a *stupa*; this indicates the place where Tathagata stopped when about to advance to Kusinagara to die, whilst men and Kinnaras[358] followed him. From this not far to the north-west is a *stupa*; here Buddha for the very last time gazed upon the city of Vaisali.[359] Not far to the south of this is a *vihara*, before which is built a *stupa;* this is the site of the garden of the Amra-girl, which she gave in charity to Buddha…

[Buddha announces to Ananda that he will die after three months].

Lichchavis lament the impending death of Buddha:

Going north-west of the chief city 50 or 60 *li*, we come to a great *stupa*. This is where the Lichchavas (*Li-ch'e-p'o*) took leave of Buddha. Tathagata having left the city of Vaisali on his way to Kusinagara, all the Lichchavas, hearing that Buddha was about to die, accompanied him wailing and lamenting. The Lord of the World having observed their fond affection, and as words were useless to calm them, immediately by his spiritual power caused to appear a great river with steep sides and deep, the waves of which flowed on impetuously. Then the Lichhavas were abruptly stopped on their way, moved with grief as they were. Then Tathagata left them his *patra* as a token of remembrance…

Going south 80 or 90 *li* from this place, we come to the *sangharama* called Svetapura (*Shi-fei-to-pu-lo*); its massive towers, with their rounded shapes and double storeys, rise in the air… Going south-east from the Svetapura *sangharama* 30 *li* or so, on either (south and north) side of the

Ganges river there is a *stupa;* this is the spot where the venerable Ananda divided his body between the two kingdoms.

Ananda realises the message of Buddha is becoming perverted and decides to depart from the world:

"Although my years are many, yet for men's sake I was wishful to remain longer in the world, to hand down and defend the true law. But now men are stained with sin, and it is exceedingly difficult to instruct them. To stay longer would be useless: I will die soon." On this, going from Magadha, he went towards the city of Vaisali, and was now in the middle of the Ganges in a boat, crossing the river. At this time the king of Magadha, hearing of Ananda's departure, his feelings were deeply affected towards him, and so, preparing his chariot, he hastened after him with his followers (*soldiers)* to ask him to return. And now his host of warriors, myriads in number, were on the southern bank of the river, when the king of Vaisali, hearing of Ananda's approach, was moved by a sorrowful affection, and, equipping his host, he also went with all speed to meet him. His myriads of soldiers were assembled on the opposite bank of the river (*the north side*), and the two armies faced each other, with their banners and accoutrements shining in the sun. Ananda, fearing lest there should be a conflict and a mutual slaughter, raised himself from the boat into mid-air, and there displayed his spiritual capabilities, and forthwith attained *Nirvana.* He seemed as though encompassed by fire, and his bones fell in two parts, one on the south side, the other on the north side of the river. Thus the two kings each took a part, and whilst the soldiers raised their piteous cry, they all returned home and built *stupas* over the relics and paid them religious worship.

BOOK VIII

Contains the First Part of the Account of the Country of Magadha (Mo-kie-t'o)

A torture chamber created by king Asoka before he accepted the Dhamma:

At first when Asoka (*Wu-yau*) raja ascended the throne, he exercised a most cruel tyranny; he constituted a hell for the purpose of torturing living creatures. He surrounded it with high walls with lofty towers. He placed there specially vast furnaces of molten metal, sharp scythes, and every kind of instrument of torture like those in the infernal regions. He selected an impious man whom he appointed lord of the hell. At first every criminal in the empire, whatever his fault, was consigned to this place of calamity and outrage; afterwards all those who passed by the place were seized and destroyed.

At this time a Sramana, just entered the religious order, was passing through the suburbs begging food, when he came to hell-gate. The impious keeper of the place laid hold upon him to destroy him. The Sramana, filled with fear, asked for a respite to perform an act of worship and confession. Just then he saw a man bound with cords enter the prison. In a moment they cut off his hands and feet, and pounded his body in a mortar, till all the members of his body were mashed up together in confusion.

The Sramana having witnessed this, deeply moved with pity, arrived at the conviction of the impermanence (*anitya*) of all earthly things, and reached the fruit of "exemption from learning" (*Arhatship*). Then the infernal lictor said, "Now you must die." The Sramana having become an Arhat, was freed in heart from the power of birth and death, and so, though cast into a boiling cauldron, it was to him as a cool lake, and on its surface there appeared a lotus flower, whereon he took his seat. The infernal lictor, terrified thereat, hastened to send a messenger to the king to tell him of the circumstance. The king having himself come and beheld the sight, raised his voice in loud praise of the miracle.

The keeper, addressing the king, said, "Maharaja, you too must die." "And why so?" said the king. "Because of your former decree with respect to the infliction of death, that all who came to the walls of the hell should be killed; it was not said that the king might enter and escape death."[360]

The king said, "The decree was indeed established, and cannot be altered. But when the law was made, were *you* excepted? You have long destroyed life. I will put an end to it." Then ordering the attendants, they seized the lictor and cast him into a boiling cauldron. After his death the king

departed, and levelled the walls, filled up the ditches, and put an end to the infliction of such horrible punishments…

Asoka meets the Arhat Upagupta and accepts the Dhamma; erects 84,000 stupas:

After King Asoka had destroyed the hell, he met Upagupta, a great Arhat, who by the use of means (religious merit), allured him in a right way according as the opportunity (his power or capacity to believe) led, and converted him. The king addressed the Arhat and said, "Thanks to my acquired merit in former births, I have got my kingly authority, but in consequence of my faults I did not, by meeting Buddha, obtain conversion. Now, then, I desire in all the greater degree to honour the bequeathed remains of his body by building *stupas*."

The Arhat said, "My earnest desire is that the great king by his merits may be able to employ the invisible powers as agents in fulfilling his vow to protect the three precious ones"…

The king having heard this, was overpowered, and he summoned the spirits to assemble, and commanded them, saying, "By the gracious disposal and spiritual efficacy of the guiding power of the King of Law I have become, as the result of my good actions in former states of life, the highest amongst them. (*I wish now*) with especial care to prepare a means of paying religious worship to the bequeathed body of Tathagata. Do you, then, spirits and genii, by your combined strength and agreement of purpose, raise *stupa* for the relics of Buddha throughout the whole of Jambudvipa, to the very last house of all (the extremity of the land). The mind (purpose) is mine, the merit of completing it shall be yours. The advantage to be derived from this excellent act of religion I wish not to be confined to one person only; let each of you, then, raise a building in readiness, and then come and receive my further commands."

Having received these instructions, the genii commenced their meritorious work in the several quarters where they were; and having finished the task (*so far)*, they came together to ask for further directions. Asoka-raja (*Wu-yau-wang*) having opened the *stupas* of the eight countries where they were built, divided the relics, and having delivered them to the genii, he addressed the Arhat (Upagupta) and said, "My desire is that the relics

should be deposited in every place at the same moment exactly: although ardently desirous of this, my mind has not yet been able to perfect a plan for accomplishing it."

The Arhat addressed the king and said, "Command the genii to go each to this appointed place and regard the sun. When the sun becomes obscured and its shape as if a hand covered it, then is the time; drop the relics into the *stupas."* The king having received these instructions, gave orders accordingly to the genii to expect the appointed day.

Meantime the king, Asoka, watching the sun's disc, waited for the sign; then at noon (*or* the day) the Arhat, by his spiritual power, stretched forth his hand and concealed the sun. At the places where the *stupas* had been built for completion, all (*genii*) observing this event, at the same moment concluded the meritorious undertaking.

Footprints of the Buddha, with auspicious signs:

By the side of the *stupa*, and not far from it, in a *vihara,* is a great stone on which Tathagata walked. There is still the impression of both his feet on it, about eighteen inches long and six inches broad; both the right and left impress have the circle-sign (*chakra*), and the ten toes are all fringed with figures of flowers (or flower scrolls) and forms of fishes, which glisten brightly in the light (*morning light*). In old time Tathagata, being about to attain *Nirvana,* was going northward to Kusinagara, when turning round to the south and looking back at Magadha, he stood upon this stone and said to Ananda, "Now for the very last time I leave this foot-impression, being about to attain *Nirvana* and looking at Magadha. A hundred years hence there shall be a King Asoka;[361] he shall build here his capital and establish his court; he shall protect the three religious treasures and command the genii"….

Sasanka tries to destroy the sacred footprints:

Lately Sasanka-raja, when he was overthrowing and destroying the law of Buddha, forthwith came to the place where that stone is, for the purpose of destroying the sacred marks. Having broken it into pieces, it came whole again, and the ornamental figures as before; then he flung it into the river Ganges, but it came back to its old place.

Asoka's inscription bestowing his kingdom on the Three Jewels:

By the side of the *vihara* which contains the traces of Buddha, and not far from it, is a great stone pillar about thirty feet high, with a mutilated inscription on it. This, however, is the principal part of it, viz., "Asoka-raja with a firm principle of faith has thrice bestowed Jambudvipa as a religious offering on Buddha, the Dharma, and the assembly, and thrice he has redeemed it with his jewels and treasure; and this is the record thereof." Such is the purport of the record.

Asoka disciplines his wayward brother for the sake of the people:

To the north of the old palace is a large stone house. It looks outside like a great mountain, and within is many tens of feet wide. This is the house which Asoka-raja commanded the genii to build for his brother who had become a recluse. Early in his life Asoka had a half-brother called Mahendra (*Mo-hi-in-to-lo*), who was born of a noble tribe. In dress he arrogated the style of the king; he was extravagant, wasteful, and cruel. The people were indignant, and the ministers and aged officers of the king came to him (*the king*), and remonstrated thus, "Your proud brother assumes a dignity as though he were some great one in comparison with others. If the government is impartial then the country is contented; if men are agreed, then the ruler is in peace: these are the principles which have been handed down to us from our fathers. We desire that you will preserve the rules of our country, and deliver to justice those who would change them." Then Asoka-raja addressed his brother as he wept, and said, "I have inherited (*as my rule of*) government the duty of protecting and cherishing the people; how then have you, my brother, forgotten my affection and my kindness? It is impossible at the very beginning of my reign to neglect the laws. If I punish you, I fear the anger of my ancestors; on the other hand, if I excuse you, I fear the opinion of the people."

Mahendra, bowing his head, replied, "I have not guarded my conduct, and have transgressed the laws of the country; I ask only an extension of my life for seven days."

On this the king placed him in a dark dungeon, and placed over him a strict guard. He provided him with every kind of exquisite meat and every necessary article. At the end of the first day the guard cried out to him,

"One day has gone; there are six days left." The sixth day having expired, as he had greatly sorrowed for his faults and had afflicted (*disciplined*) his body and his heart, he obtained the fruit of sanctity (*became an Arhat*); he mounted into the air and exhibited his miraculous powers. Then separating himself from the pollution of the world, he went afar, and occupied the mountains and valleys (*as a recluse*).

Asoka-raja, going in his own person, addressed him as follows, "At first, in order to put in force the laws of the country, I desired to have you punished, but little did I think you would have attained to this highest rank of holiness. Having, however, reached this condition of detachment from the world, you can now return to your country."

The brother replied, "Formerly I was ensnared in the net of (*worldly*) affections, and my mind was occupied with love of sounds (*music*) and beauty; but now I have escaped all this and my mind delights in (*the seclusion of)* mountains and valleys. I would fain give up the world forever and dwell here in solitude".

The king said, "If you wish to subdue your heart in quiet, you have no need to live in the mountain fastness. To meet your wishes I shall construct you a dwelling."

Accordingly he summoned the genii to his presence and said to them, "On the morrow I am about to give a magnificent feast. I invite you to come together to the assembly, but you must each bring for your own seat a great stone." The genii having received the summons, came at the appointed time to the assembly. The king then addressed them and said, "The stones which are now arranged in order on the ground you may pile up, and, without any labour to yourselves, construct of them for me an empty house." The genii having received the order, before the day was over finished the task. Asoka-raja then himself went to invite his brother to fix his abode in this mountain cell.

Grandeur of *sangharama* of Tiladaka (Ti-lo-shi-kia):[362]

This building has four halls, belvederes of three stages, high towers, connected at intervals with double gates that open inwards. It was built by the last descendant of Bimbisara-raja (*Pin-pi-sha-lo*).[363] He made much of

high talent and exalted the virtuous. Learned men from different cities and scholars from distant countries flock together in crowds, and reaching so far, abide in this *sangharama.* There are 1000 priests in it who study the Great Vehicle. In the road facing the middle gate there are three *viharas,* above which are placed the connected succession of metal rings with bells suspended in the air; below they are constructed storey above storey, from the bottom to the top. They are surrounded by railings, and the doors, windows, the pillars, beams, and staircases are all carved with gilt copper in relief, and in the intervals highly decorated. The middle *vihara* contains an erect image of Buddha about thirty feet high. On the left is an image of Tara (*To-lo*) Bodhisattva;[364] on the right, one of Avalokitesvara (*Kwan-tsz'-tsai*) Bodhisattva. Each of these images is made of metallic stone; their spiritually composed appearance inspires a mysterious awe, and their influence is felt from far. In each *vihara* there is a measure of relics which emit a supernatural brilliancy, and from time to time shed forth miraculous indications.

Gunamati (Kiu-na-mo-ti) Bodhisattva defeats Madhava:

In the early time there was in this mountain a heretic called Madhava (*Mo-ta-po*), who at first followed the law of the Sankhya (*Seng-kie*) system, and practiced the acquirement of wisdom. He had studied to the bottom the doctrine of "the extreme void," as found in the orthodox and erroneous (*books*). His fame was great, and surpassed that of former teachers, and outweighed all then living. The king honoured him exceedingly, and named him "the treasure of the country." The ministers and people regarded him with admiration, and spoke of him as "the teacher of the household"…

At this time in Southern India there lived Gunamati Bodhisattva, who in his youth had displayed great talents and acquired in early life a brilliant reputation. By close study he had penetrated the meaning of the three *Pitakas,* and investigated the four truths. Hearing that Madhava discussed on the most mysterious and subtle questions, he desired to humble him by overcoming him (*in argument*). He ordered one of his followers to carry a letter thus written (*to Madhava*): "I have heard with all respect of Madhava's virtuous ease. You must now, without thought of fatigue, take up

again your ancient studies, for in three years' time I intend to overthrow your brilliant reputation."

And so in the second and third years he sent a messenger with the same tidings; and now when he was about to go to meet him, he again wrote a letter, saying: "The appointed period has expired; your studies, such as they are, I am now coming (*to investigate*); you ought to know the fact."

[Alarmed, Madhava ordered the towns not to entertain any Sramanas. Gunamati found no place to stay, but a novice believer guided him to the palace, where they sought permission to debate with Madhava. The king summoned Madhava]

Madhava hearing this, his heart was very sad, but as he could not well avoid the difficulty, he set out for the hall of discussion, where the king, the ministers, and the people were all assembled desiring to hear this great controversy. Gunamati first laid down the principles of his school, and continued his speech till the setting of the sun. Then Madhava excusing himself on account of his age and infirmities, to defer his answer, asked permission to retire and meditate. He would then return and answer every objection (*difficulty*) in order. At the early morn he returned and ascended the throne, and so they went on to the sixth day, but on that day he vomited blood and died. When on the point of death he gave this command to his wife, "You have high talent; do not forget the affront paid to me." When Madhava was dead, she concealed the fact and had no funeral ceremonies; and clothing herself in shining apparel, she entered forthwith the assembly where the discussion was held, and a general clamour was raised as the people said one to another, "Madhava, who boasted to his talents, is unable to reply to Gunamati, and so he sends his wife to make up for his deficiency."

Gunamati, addressing the wife, said, "He who could bind you, has been bound by me."

Madhava's wife seeing the difficulty, retired. The king then said, "What secret words are these at which she remains silent?"

Gunamati said, "Alas! Madhava is dead! And his wife desires to come and discuss with me!"

The king said, "How do you know this? Pray explain it to me."

Then Gunamati said, "When the wife came her face was pale as death, and her words were toned in bitter enmity. I knew therefore that Madhava is

dead! ‘Able to bind you,’ is a phrase applicable to her husband.”

The king having sent a messenger to verify the statement, he found it even so; then the king in gratitude said, “The law of Buddha is a mysterious one! Eminent sages succeed one another without interruption; with no personal object they guard themselves in wisdom and use their secret knowledge for the purpose of converting (*transforming the world*). According to the old rules of the country the praises of such a sage (*or,* of your virtue) should be ever celebrated.”

Gunamati replied, “Whatever poor talents I have, I reserve them for the benefit of all that lives; and when I would draw them to the truth first of all I subdue their pride, then use the influences of converting power. Now then, in this case, O king, let the descendants of Madhava’s territory for a thousand generations employ themselves in the service of a *sangharama.* Your instructions will extend, then, from age to age, and your reputation will be immortal. Persons of a pure faith, conscious of protection, their religious merit will benefit the country for ages. They will be nourished as the priests are, and so the faithful will be encouraged to honour their virtue.”

On this he founded the *sangharama* to celebrate the victory.

The Brahmin Silabhadra converts after meeting Dharmapala Bodhisattva; defeats other heretics:

South-west of the convent of Gunamati about 20 *li* we come to a solitary hill on which is a convent called (*the sangharama of*) Silabhadra (*Shi-lo-po-t’o-lo*). This is the convent which the master of *sastras* after his victory caused to be built out of the funds of a village which were given up. It stands by the side of a single sharp crag like a *stupa*. It contains some sacred relics of Buddha. This master of *sastras* belonged to the family of the king of Samatata (*San-mo-ta-ch’a*), and was of the Brahman caste. He loved learning and had gained a wide reputation. Travelling through the Indies to examine into and seek after religious truth, he came to this kingdom, and in the *sangharama* of Nalanda (*Na-lan-t’o*) he encountered Dharmapala Bodhisattva (*Hu-fa-pu-sa*). Hearing him explain the law, his understanding was opened, and he requested to become a disciple. He inquired into the most subtle questions, and investigated the way of

deliverance to its conclusion; and thus having reached the highest point of intelligence, he established his fame over men of his time, even to distant countries.

There was a heretic of South India who delighted in examining profound questions and searching out hidden matters, in penetrating obscure and abstruse points of doctrine. Hearing of Dharmapala's fame, the pride of self rose up within him, and, moved by profound envy, he passed over mountains and rivers in order to sound the drum (*challenge*) and seek discussion. He said, "I am a man of Southern India. It is reported that in the king's country there is a great master of *sastras,* I am but ignorant, yet I would wish to discuss with him."

[The king requested Dharmapala to engage with the ascetic, but Silabhadra, then 30 years old, begged to conduct the debate]:

On the day of discussion the people came together from far and near; both old and young in numbers assembled. Then the heretical teacher on his part laid open his case with great emphasis, and penetrated to the utmost the abstruse points (*of his argument*). Silabhadra followed his arguments (*principles*), and refuted them by profound and subtle allegations. The heretic, his words being exhausted, was covered with shame and retired.

The king, in order to reward the virtue (*of Silabhadra*), gave him the revenues of this town as a bequest. The master of *sastras,* declining the offer, said, "A master who wears the garments of religion (*dyed garments*) knows how to be contented with little and to keep himself pure. What would he do with a town?"

The king in reply said, "The King of the Law has passed into the obscure (*abode*), and the vessel of wisdom has been engulfed in the stream. If there are no distinctions now made (*between the learned and ignorant*), then no encouragement is given to the scholar to press forward in the attainment of religion. Pray, of your pity, accept my offering."

The doctor, not persisting in his refusal, accepted the town and built this *sangharama,* vast and magnificent, and endowed it with the revenues of the town, as a means of providing it with the offerings necessary for religious service.

The famous Bodhi tree and the end of the Dhamma:

Going south-west from Mount Pragbodhi about 14 or 15 *li*, we come to the Bodhi tree. It is surrounded by a brick wall of considerable height, steep and strong. It is long from east to west, and short from north to south. It is about 500 paces round. Rare trees with their renowned flowers connect their shade and cast their shadows; the delicate *sha* (*cyperus iria*) herb and different shrubs carpet the soil. The principal gate opens to the east, opposite the Nairanjana river. The southern gate adjoins a great flowery bank. The western side is blocked up and difficult of access (*steep and strong*). The northern gate opens into the great *sangharama.* Within the surrounding wall the sacred traces touch one another in all directions. Here there are *stupas,* in another place *viharas.* The kings, princes, and great personages throughout all Jambudvipa, who have accepted the bequeathed teaching as handed down to them, have erected these monuments as memorials.

In the middle of the enclosure surrounding the *Bodhi* tree is the diamond throne (*Vajrasana*). In former days, when the Bhadra-kalpa was arriving at the period of perfection (*vivartta*), when the great earth arose, this (*throne*) also appeared. It is in the middle of the great chiliocosm*;* it goes down to the limits of the golden wheel (*gold circle*), and upwards it is flush with the ground. It is composed of diamond. In circuit it is 100 paces or so. On this the thousand Buddhas of the Bhadra-kalpa have sat and entered the diamond *Samadhi;* hence the name of the diamond throne. It is the place where the Buddhas attain the holy path (*of Buddhahood*). It is also called the *Bodhimanda*. When the great earth is shaken, this place alone is unmoved. Therefore when Tathagata was about to reach the condition of enlightenment, and he went successively to the four angles of this enclosure, the earth shook and quaked; but afterwards coming to this spot, all was still and at rest. From the time of entering on the concluding portion of the *kalpa*, when the true law dies out and disappears, the earth and dust begin to cover over this spot, and it will be no longer visible.

After the *Nirvana* of Buddha, the rulers of the different countries having learned by tradition the measurement of the diamond throne, decided the limits from north to south by two figures of *Kwan-tsz'-tsai* (Avalokitesvara) Bodhisattva, there seated and looking eastward.

The old people say that "as soon as the figures of this Bodhisattva sink in the ground and disappear, the law of Buddha will come to an end." The

figure at the south angle is now buried up to its breast. The *Bodhi* tree above the diamond throne is the same as the *Pippala* tree. In old days, when Buddha was alive, it was several hundred feet high. Although it has often been injured by cutting, it still is 40 or 50 feet in height. Buddha sitting under this tree reached perfect wisdom, and therefore it is called the (*Samyak sambodhi*) tree of knowledge (*Pu-ti-Bodhi*). The bark is of a yellowish-white colour, the leaves and twigs, of a dark green. The leaves wither not either in winter or summer, but they remain shining and glistening all the year round without change. But at every successive *Nirvana-day* (*of the Buddhas*) the leaves wither and fall, and then in a moment revive as before. On this day the princes of different countries and the religious multitude from different quarters assemble by thousands and ten thousands unbidden, and bathe (*the roots*) with scented water and perfumed milk; whilst they raised the sounds of music and scatter flowers and perfumes, and whilst the light of day is continued by the burning torches, they offer their religious gifts.

King Asoka tries to destroy the Bodhi tree, but repents:

After the *Nirvana* of Tathagata, when Asoka-raja began to reign, he was an unbeliever and he desired to destroy the bequeathed traces of Buddha; so he raised an army, and himself taking the lead, he came here for the purpose of destroying (*the tree*). He cut through the roots; the trunk, branches, and leaves were all divided into small bits and heaped up in a pile a few tens of paces to the west of the place. Then he ordered a Brahman who sacrificed to fire to burn them in the discharge of his religious worship. Scarcely had the smoke cleared away, when lo! A double tree burst forth from the flaming fire, and because the leaves and branches were shining like feathers, it was called the “ashes bodhi tree”. Asoka-raja, seeing the miracle, repented of his crime. He bathed the roots (*of the old tree*) with perfumed milk to fertilise them, when lo! on the morning of the next day, the tree sprang up as before. The king, seeing the miraculous portent, was overpowered with deep emotion, and himself offered religious gifts, and was so overjoyed that he forgot to return (*to the palace*). The queen, who was an adherent of the heretics, sent secretly a messenger, who, after the first division of night, once more cut it down. Asoka-raja in the morning coming again to worship

at the tree, seeing only the mutilated trunk, was filled with exceeding grief. With the utmost sincerity he prayed as he worshiped; he bathed the roots with perfumed milk, and in less than a day again the tree was restored. The king, moved by deep reverence at the prodigy, surrounded the tree with a stone (*brick*) wall above 10 feet, which still remains visible. In late times Sasanka-raja (*She-shang-kia*), being a believer in heresy, slandered the religion of Buddha, and through envy destroyed the convents and cut down the *Bodhi* tree, digging it up to the very springs of the earth; but yet he did not get to the bottom of the roots. Then he burnt it with fire and sprinkled it with the juice of the sugar-cane, desiring to destroy it entirely, and not leave a trace of it behind.

Purnavarma revives the Bodhi tree:

Some months afterwards, the king of Magadha, called Purnavarma (*Pu-la-na-fa-mo*), the last of the race of Asoka-raja, hearing of it, sighed and said, "The sun of wisdom having set, nothing is left but the tree of Buddha, and this they now have destroyed, what source of spiritual life is there now?" He then cast his body on the ground overcome with pity; then with the milk of a thousand cows he again bathed the roots of the tree, and in a night it once more revived and grew to the height of some 10 feet. Fearing lest it should be again cut down, he surrounded it with a wall of stone 24 feet high.

The Nyagrodha tree:

At the south-east angle of the wall of the *Bodhi* tree is a *stupa* by the side of a Nyagrodha (*ni-ken-liu*) tree. Beside it there is a *vihara* in which is a sitting figure of Buddha. This is the spot where the great Brahmadeva exhorted Buddha, when he had first acquired enlightenment, to turn the wheel of the excellent law.[365]

The Naga king Muchilinda:

To the east of the pond which Sakra caused to appear, in the midst of a wood, is the lake of the Naga king Muchilinda (*Mu-chi-lin-t'o*). The water of this lake is of a dark blue colour, its taste is sweet and pleasant; on the

west bank is a small *Vihara* in which is a figure of Buddha. Formerly, when Tathagata first acquired complete enlightenment, he sat on this spot in perfect composure, and for seven days dwelt in ecstatic contemplation. Then this Muchilinda Naga-raja kept guard over Tathagatha; with his folds seven times round the body of Buddha, he caused many heads to appear, which over-shadowed him as a parasol; therefore to the east of this lake is the dwelling of the Naga.

How the Mahabodhi vihara was built by the king of Ceylon:

Outside the northern gate of the wall of the *Bodhi* tree is the Mahabodhi *sangharama.* It was built by a former king of Simhala (*Ceylon*, Sri Lanka). This edifice has six halls, with towers of observation of three storeys; it is surrounded by a wall of defence thirty or forty feet high. The utmost skill of the artist has been employed; the ornamentation is in the richest colours (*red and blue*). The statue of Buddha is cast of gold and silver, decorated with gems and precious stones. The *stupas* are high and large in proportion, and beautifully ornamented; they contain relics of Buddha. The bone relics are as great as the fingers of the hand, shining and smooth, of a pure white colour and translucent. The flesh relics are like the great true pearl, of a bluish-red tint. Every year on the day of the full moon of (*the month when*) Tathagata displayed great spiritual changes, they take these relics out for public exhibition. On these occasions sometimes a bright light is diffused, sometimes it rains flowers. The priests of the convent are more than 1000 men; they study the Great Vehicle and belong to the Sthavira (*Shang-tso-pu*) school. They carefully observe the *Dharma Vinaya,* and their conduct is pure and correct.

In old days there was a king of Ceylon, which is a country of the southern sea, who was truthful and a believer in the law of Buddha. It happened that his brother, who had become a disciple of Buddha, thinking on the holy traces of Buddha, went forth to wander through India. At all the convents he visited, he was treated with disdain as a foreigner (*a frontier countryman*). On this he returned to his own country. The king in person went out to a distance to meet him, but the Sramana was so affected that he could not speak. The king said, “What has so afflicted you as to cause this excessive grief?” The Sramana replied, “I, relying on the dignity of your Majesty’s

kingdom, went forth to visit the world, and to find my way through distant regions and strange cities. For many years all my travels, during heat and cold, have been attended with outrage, and my words have been met with insults and sarcasm. Having endured these afflictions, how can I be light-hearted?"

The king said, "If these things are so, what is to be done?"

He replied, "In truth, I wish your Majesty in the field of merit would undertake to build convents throughout all India. You would thus signalise the holy traces, and gain for yourself a great name; you would show your gratitude for the advantage derived from your predecessors, and hand down the merit thereof to your successors."

He replied, "This is an excellent plan; how have I but just heard of it?"

Then he gave in tribute to the king of India all the jewels of his country. The king having received them as tribute, from a principle of duty and affection to his distant ally, he sent messengers to say, "What can I now do in return for the decree?"

The minister said, "The king of Simhala salutes the king of India (*Maha Sri raja*). The reputation of the Maharaja has spread far and wide, and your benefits have reached to distant regions. The Sramanas of this inferior country desire to obey your instructions and to accept your transforming influences. Having wandered through your superior country in visiting the sacred traces, I called at various convents and found great difficulty in getting entertainment, and so, fatigued and very much worn by affronts, I returned home. I have therefore formed a plan for the benefit of future travellers; I desire to build in all the Indies a convent for the entertainment of such strangers, who may have a place of rest between their journey there and back. Thus the two countries will be bound together and travellers be refreshed."

The king said, "I permit your royal master to take (*for this purpose*) one of the places in which Tathagata has left the traces of his holy teaching."

On this the messenger returned home, having taken leave of the king, and gave an account of his interview. The ministers received him with distinction and assembled the Sramanas and deliberated as to the foundation of a convent. The Sramanas said, "The (*Bodhi*) tree is the place where all the past Buddhas have obtained the holy fruit and where the future ones will obtain it. There is no better place than this for carrying out the project."

Then, sending all the jewels of the country; they built this convent to entertain priests of this country (*Ceylon*), and he caused to be engraved this proclamation on copper, "To help all without distinction is the highest teaching of all the Buddhas; to exercise mercy as occasion offers is the illustrious doctrine of former saints. And now I, unworthy descendant in the royal line, have undertaken to found this *sangharama,* to enclose the sacred traces, and to hand down their renown to future ages, and to spread their benefits among the people. The priests of my country will thus obtain independence, and be treated as members of the fraternity of this country. Let this privilege be handed down from generation to generation without interruption."

BOOK IX

The Second Part of the Country of Magadha

King Bimbisara visits Buddha:

To the south-east of the Yashtivana about six or seven *li* we come to a great mountain. Before a cross-ridge of this mountain is a *stupa.* Here in old days Tathagata explained the law during the three months of rain for the benefit of men and Devas. Then Bimbisara-raja (*Pin-pi-so-lo*) wished to come to hear the law. He cut away the mountain, and piled up the stones to make steps in order to ascend. The width is about twenty paces and the length 3 or 4 *li*.[366]

Rajagriha (royal residence) - and its beauty:

… we arrive at the city Kusagara-pura (*Kiu-she-kie-lo-pu-lo*), or "the royal city of best grass (*lucky grass*)." This is the central point of the kingdom of Magadha. Here the former kings of the country fixed their capital. It produces much of the most excellent, scented, fortunate grass, and therefore it is called "the city of the superior grass." High mountains surround it on each side, and form as it were its external walls.[367] On the west it is approached through a narrow pass, on the north there is a passage through the mountains. The town is extended from east to west and narrow from north to south. It is about 150 *li* in circuit. The remaining foundations

of the wall of the inner city are about 30 *li* in circuit. The trees called *Kie-ni-kia* (Kanakas) border all the roads, their flowers exhale a delicious perfume, and their colour is of a bright golden hue. In the spring months the forests are all of a golden colour.

The story of Sariputra and his attainment of Arhatship:

[North-east of the north gate of the palace] … is a *stupa.* This is where Sariputra (*She-li-tseu*) heard Asvajita (*O-shi-p'o-shi*) the Bhikshu declare the law, and by that means reached the fruit (*of an Arhat*). At first Sariputra was a layman; he was a man of distinguished ability and refinement, and was highly esteemed by those of his own time. At this time, with other students, he accepted the traditional teaching as delivered to him. On one occasion, being about to enter the great city of Rajagriha, the Bhikshu Asvajita (*Ma-shing*) was also just going his round of begging. Then Sariputra, seeing him at a distance, addressed his disciples, saying, "Yonder man who comes, so full of dignity and nobleness, if he has not reached the fruit of sanctity (*Arhatship*), how is he thus composed and quiet? Let us stop awhile and observe him as he approaches." Now as Asvajita Bhikshu had reached the condition of an Arhat, his mind was self-possessed, his face composed and of an agreeable refinement; thus, holding his religious staff, he came along with a dignified air. Then Sariputra said, "Venerable sir! Are you at ease and happy? Pray, who is your master, and what the system you profess, that you are so gladsome and contented?"

Asvajita answering him said, "Know you not the royal prince, the son of Suddhodana-raja, who gave up the condition of a Chakravarttin monarch, and from pity to the six kinds of creatures for six years endured penance and reached the condition of *Sambodhi,* the state of perfect omniscience? This is my master! As to his law, it has respect to a condition including the absence of existence, without nonentity; it is difficult to define; only Buddhas with Buddhas can fathom it; how much less can foolish and blind mortals, such as I, explain its principles. But for your sake I will recite a stanza in praise of the law of Buddha." Sariputra having heard it, obtained forthwith the fruit of Arhatship.

Vulture peak and king Bimbisara:

To the north-east of the palace city going 14 or 15 *li*, we come to the southern Gridhrakuta (*Ki-li-tho-kiu-ch'a*). Touching the southern slope of the northern mountain, it rises as a solitary peak to a great height, on which vultures make their abode. It appears like a high tower on which the azure tints of the sky are reflected, the colours of the mountain and the heaven being commingled.

When Tathagata had guided the world for some fifty years, he dwelt much in this mountain, and delivered the excellent law in its developed form (*kwang*).[368] Bimbisara-raja, for the purpose of hearing the law, raised a number of men to accompany him from the foot of the mountain to its summit. They levelled the valleys and spanned the precipices, and with the stones made a staircase about ten paces wide and 5 or 6 *li* long. In the middle of the road there are two small *stupas*, one called "Dismounting from the chariot" (*Hia-shing*), because the king when he got here, went forward on foot. The other is called "Sending back the crowd" (*Tui-fan*), because the king, separating the common folk, would not allow them to proceed with him. The summit of this mountain is long from the east to the west and narrow from north to south. There is a brick *vihara* on the borders of a steep precipice at the western end of the mountain. It is high and wide and beautifully constructed. The door opens to the east. Here Tathagata often stopped in old days and preached the law. There is now a figure of him preaching the law of the same size as life.

To the east of the *vihara* is a long stone, on which Tathagata trod as he walked up and down for exercise. By the side of it is a great stone about fourteen or fifteen feet high and thirty paces round. This is the place where Devadatta (cousin and mortal enemy of Buddha) flung a stone from a distance to strike Buddha.

South of this, below the precipice, is a *Stupa.* Here Tathagata, when alive in old time, delivered the *Saddharma Pundarika Sutra.*

To the south of the *vihara,* by the side of a mountain cliff, is a great stone house. In this Tathagata, when dwelling in the world long ago, entered *Samadhi.*

Mara frightens Ananda; Buddha reassures him:

To the north-west of the stone house and in front of it is a great and extraordinary stone. This is the place where Ananda (*O-nan*) was frightened by Mara. When the venerable Ananda had entered *Samadhi* in this place, Mara-raja, assuming the form of a vulture, in the middle of the night, during the dark portion of the month, took his place on this rock, and flapping his wings and uttering loud screams, tried to frighten the venerable one. Ananda, filled with fear, was at a loss to know what to do; then Tathagata, by his spiritual power, seeing his state, stretched out his hand to compose him. He pierced the stone wall and patted the head of Ananda, and with his words of great love he spoke to him thus: "You need not fear the assumed form which Mara has taken." Ananda in consequence recovered his composure, and remained with his heart and body at rest and in peace.

Although years and months have elapsed since then, yet the bird traces on the stone and the hole in the rock still remain visible.

Asoka rebuilds Ajatasatru's stupa:

To the east of the Karandavenuvana is a *stupa* which was built by Ajatasatru-raja. After the *Nirvana* of Tathagata the kings divided the relics (*she-li*); the king Ajatasatru returned then with his share and from a feeling of extreme reverence built (*a stupa*) and offered his religious offerings to it. When Asoka-raja (*Wu-yau*) became a believer, he opened it and took the relics, and in his turn built another *stupa*. This building constantly emits miraculous light.

Relics of Ananda:

By the side of the *stupa* of Ajatasatru-raja is another *stupa* which encloses the relics of half of the body of Ananda. Formerly, when the saint was about to reach *Nirvana,* he left the country of Magadha and proceeded to the town of Vaisali (*Fei-she-li*). As these two countries disputed (*about him*) and began to raise troops, the venerable one, from pity, divided his body into two parts. The king of Magadha, receiving his share, returned and offered to it his religious homage, and immediately prepared in this renowned land, with great honour, to raise a *stupa.* By the side of this building is a place where Buddha walked up and down.

First Buddhist Council called by Kasyapa to settle the doctrine after seeing Buddha's Nirvana through divine sight; Ananda is initially excluded:

To the south-west of the bamboo garden (Venuvana) about 5 or 6 *li*, on the north side of the southern mountain, is a great bamboo forest. In the middle of it is a large stone house. Here the venerable Kasyapa with 999 great Arhats, after Tathagata's *Nirvana,* called a convocation (*to settle*) the three *Pitakas*.[369] Before it is the old foundation-wall. King Ajatasatru made this hall[370] for the sake of accommodating the great Arhats who assembled to settle the *Dharma-pitaka.*

At first, when Maha Kasyapa was seated in silent (*study*) in the desert (*mountain forests*), suddenly a bright light burst forth, and he perceived the earth shaking. Then he said, "What fortunate change of events is there, that this miracle should occur?" Then exerting his divine sight, he saw the Lord Buddha between the two trees entering *Nirvana.* Forthwith he ordered his followers to accompany him to the city of Kusinagara (*Ku-shi*). On the way they met a Brahman holding in his hands a divine flower. Kasyapa, addressing him, said, "Whence come you? Know you where our great teacher is at present?" The Brahman replied and said, "I have but just come from yonder city of Kusinagara, where I saw your great master just entered into *Nirvana.* A vast multitude of heavenly beings were around him offering their gifts in worship, and this flower, which I hold, I brought thence."

Kasyapa having heard these words said to his followers, "The sun of wisdom has quenched his rays. The world is now in darkness. The illustrious guide has left us and gone, and all flesh must fall into calamity."

Then the careless Bhikshus said one to another with satisfaction, "Tathagata has gone to rest. This is good for us, for now, if we transgress, who is there to reprove or restrain us?"

Then Kasyapa, having heard this, was deeply moved and afflicted, and he resolved to assemble (*collect*) the treasure of the law (*Dharma-pitaka*) and bring to punishment the transgressors. Accordingly he proceeded to the two trees, and regarding Buddha, he offered worship.

And now the King of the Law having gone from the world, both men and Devas were left without a guide, and the great Arhats, moreover, were cleaving to (*the idea of their*) *Nirvana.* Then the great Kasyapa reflected

thus: “To secure obedience to the teaching of Buddha, we ought to collect the *Dharma-pitaka.”* On this he ascended Mount Sumeru and sounded the great gong (*ghanta*), and spake thus: “Now then, in the town of Rajagriha there is going to be a religious assembly. Let all those who have obtained the fruit (*of arhatship*) hasten to the spot.”

In connection with the sounding of the gong the direction of Kasyapa spread far and wide through the great chiliocosm, and all those possessed of spiritual capabilities, hearing the instructions, assembled in convocation. At this time Kasyapa addressed the assembly and said, “Tathagata having died (*attained Nirvana*), the world is empty. We ought to collect the *Dharma-pitaka,* in token of our gratitude to Buddha. Now then, being about to accomplish this, there should be profound composure (*quiet*). How can this be done in the midst of such a vast multitude? Those who have acquired the three species of knowledge (*trividya*), who have obtained the six supernatural faculties (*shadabhijnas*), who have kept the law without failure, whose powers of discrimination (*dialectic*) are clear, such superior persons as these may stop and form the assembly. Those who are learners with only limited fruit, let such depart to their homes.”

On this 999 men were left; but he excluded Ananda, as being yet a learner. Then the great Kasyapa, calling him, addressed him thus: “You are not yet free from defects; you must leave the holy assembly.” He replied, “During many years I have followed Tathagata as his attendant; every assembly that has been held for considering the law, I have joined; but now, as you are going to hold an assembly after his death (*wai*), I find myself excluded; the King of the Law having died, I have lost my dependence and helper.”

Kasyapa said, “Do not cherish your sorrow! You were a personal attendant on Buddha indeed, and you therefore heard much, and so you loved (*much*), and therefore you are not free from all the ties that bind (*the soul*).”

Ananda, with words of submission, retired and came to a desert place, desiring to reach a condition “beyond learning;” he strove for this without intermission, but with no result. At length, wearied out, he desired one day to lie down. Scarcely had his head reached the pillow when lo! he obtained the condition of an Arhat.

He then went to the assembly, and knocking at the door, announced his arrival. Kasyapa then asked him, saying, “Have you got rid of all ties? In that case exercise your spiritual power and enter without the door being

opened!" Ananda, in compliance with the order, entered through the keyhole, and having paid reverence to the priesthood, retired and sat down.

At this time fifteen days of the summer rest (*Varsavasana*) had elapsed. On this Kasyapa rising, said, "Consider well and listen! Let Ananda, who ever heard the words of Tathagata, collect by singing through the *Sutra-pitaka.* Let Upali (*Yeu-po-li*), who clearly understands the rules of discipline (*Vinaya*), and is well known to all who know, collect the *Vinaya-pitaka;* and I, Kasyapa, will collect the *Abhidharma-pitaka.*" The three months of rain being past, the collection of the *Tripitaka* was finished. As the great Kasyapa was the president (*Sthavira*) among the priests, it is called the Sthavira (*Chang-tso-pu*) convocation.[371]

The assembly of those excluded by Kasyapa:

[to the west] … is the spot where the "great assembly" (*Mahasangha*) formed their collection of books. Those who had not been permitted to join Kasyapa's assembly, whether learners or those above learning (*Arhats*), to the number of 100,000 men, came together to this spot and said, "Whilst Tathagata was alive we all had a common master, but now the King of the Law is dead it is different. We too wish to show our gratitude to Buddha, and we also will hold an assembly for collecting the scriptures." On this the common folk with the holy disciples came to the assembly, the foolish and wise alike flocked together and collected the *Sutra-pitaka,* the *Vinaya-pitaka,* the *Abhidharma-pitaka*, the miscellaneous *Pitaka* (*Khuddakanikaya*),[372] and the *Dharani-pitaka.* Thus they distinguished five *Pitakas*. And because in this assembly both common folk and holy personages were mixed together, it was called "the assembly of the great congregation" (*Mahasangha*).[373]

Bimbisara and the destruction of old city of Rajagriha by frequent fires:

… we come to the town of Rajagriha (*Ho-lo-shi-ki-li-hi*). The outer walls of this city have been destroyed, and there are no remnants of them left; the inner city (*walls*) although in a ruined state, still have some elevation from the ground, and are about 20 *li* in circuit.[374] In the first case, Bimbisara-raja

established his residence in Kusagara; in this place the houses of the people, being close together, were frequently burned with fire and destroyed. When one house was in flames, it was impossible to prevent the whole neighbourhood sharing in the calamity, and consequently the whole was burned up. Then the people made loud complaints, and were unable to rest quietly in their dwellings. The king said, "By my demerit the low people are afflicted; what deed of goodness can I do in order to be exempt from such calamities?" His ministers said, "Maharaja, your virtuous government spreads peace and harmony, your righteous rule causes light and progress. It is by want of due attention on the part of the people that these calamities of fire occur. It is necessary to make a severe law to prevent such occurrences hereafter. If a fire breaks out, the origin must be diligently sought for, and to punish the principal guilty person, let him be driven into the cold forest. Now this cold forest (*sitavana*) is the place of corpses abandoned there. Every one esteems it an unlucky place and the people of the land avoid going there and passing through it. Let him be banished there as a cast-out corpse. From dread of this fate, the people will become careful and guard (*against outbreak of fire*)." The king said, "It is well; let this announcement be made, and let the people attend to it."

And now it happened that the king's palace was the first to be burned with fire. Then he said to his ministers, "I myself must be banished;" and he gave up the government to his eldest son in his own place. "I wish to maintain the laws of the country; I therefore myself am going into exile."

At this time the king of Vaisali hearing that Bimbisara-raja was dwelling alone in the "cold forest," raised an army and put it in movement to invade (*make a foray*) when nothing was ready (*to resist him*). The lords of the marches (*frontiers*), hearing of it, built a town, and as the king was the first to inhabit it, it was called "the royal city" (Rajagriha). Then the ministers and the people all flocked there with their families.

It is also said that Ajatasatru-raja first founded this city, and the heir-apparent of Ajatasatru having come to the throne, he also appointed it to be the capital, and so it continued till the time of Asoka-raja, who changed the capital to Pataliputra, and gave the city of Rajagriha to the Brahmans, so that now in the city there are no common folk to be seen, but only Brahmans to the number of a thousand families.

Nalanda vihara and the prophecy of the Nirgrantha:

Going north from this 30 *li* or so, we come to Nalanda *sangharama*.[375] The old accounts of the country say that to the south of this *sangharama,* in the middle of an Amra (*An-mo-lo*) grove, there is a tank. The Naga of this tank is called Nalanda. By the side of it is built the *sangharama,* which therefore takes the name (*of the Naga*). But the truth is that Tathagata in old days practiced the life of a Bodhisattva here, and became the king of a great country, and established his capital in this land. Moved by pity for living things, he delighted in continually relieving them. In remembrance of this virtue he was called "charity without intermission;" and the *sangharama* was called in perpetuation of this name. The site was originally an Amra garden. Five hundred merchants bought it for ten *kotis* of gold pieces and gave it to Buddha. Buddha preached the law here during three months, and the merchants and others obtained the fruit of holiness. Not long after the Nirvana of Buddha, a former king of this country named Sakraditya (*Shi-kia-lo-'o-' tie-to*) respected and esteemed the one vehicle and honoured very highly the three treasures. Having selected by augury a lucky spot, he built this *sangharama.* When he began the work he wounded, in digging, the body of the Naga. At this time there was a distinguished soothsayer belonging to the heretical sect of the Nirgranthas. He having seen the occurrence, left this record: "This is a very superior site. If you build here a *sangharama,* it must of necessity become highly renowned. Throughout the five Indies it will be a model. For a period of a thousand years it will flourish still. Students of all degrees will here easily accomplish their studies. But many will spit blood because of this wound given to the Naga."

Chinese monks visit the assembly called by Baladitya; he renounces the throne, but not desire:

Baladitya-raja (*P'o-lo-' o-tie-lo*) succeeded to the empire. On the north-east side he built a *sangharama.* The work being done, he called together an assembly for congratulation. He respected equally the obscure and the renowned, and invited common folk and men of religion (*holiness*) without distinction. The priests of all India came together for the distance of 10,000 *li*. After all were seated and at rest, two priests arrived. They led them up the three-storeyed pavilion. Then they asked them, saying, "The king, when

about to call the assembly, first asked men of all degrees (*common and holy*). From what quarter do your reverences come so late?" They said, "We are from the country of China. Our teacher was sick. Having nourished him, we set out to accept the king's far-off invitation. This is the reason why we have arrived so late."

The assembly hearing this, were filled with astonishment, and proceeded at once to inform the king. The king knowing that they were holy persons, went himself to interrogate them. He mounted the pavilion, but he knew not where they had gone. The king then was affected by a profound faith; he gave up his country and became a recluse. Having done so, he placed himself as the lowest of the priests, but his heart was always uneasy and ill at rest. "Formerly (*he said*) I was a king, and the highest among the honourable; but now I have become a recluse, I am degraded to the bottom of the priesthood." Forthwith he went to the priests, and said words to the above effect. On this the *sangha* resolved that they who had not received the full orders should be classed according to their natural years of life. This *sangharama* is the only one in which this law exists.[376]

Stupa of Mudgalaputra in village Kulika (kiu-li-kia):

[Built by Asoka-raja]. This is where the venerable Mudgalaputra (*Mo-te-kia-lo-tseu*) was born. By the side of the village is a *stupa.* This is where the Venerable One reached complete *Nirvana,* and in it are placed the remains of his bequeathed body. The venerable (Maha-mudgalaputra) was of a great Brahman family, and was an intimate friend of Sariputra when they were young. This Sariputra was renowned for the clearness of his dialectic skill; the other for his persevering and deep penetration. Their gifts and wisdom were alike, and moving or standing they were always together. Their aims and desires from beginning to end were just the same. They had together left the world from distaste to its pleasures, and as hermits had followed Sanjaya (*Shen-she-ye*) as their master. Sariputra having met Asvajita (*Ma-shing*) the Arhat, hearing the law, understood its holy (*meaning*). On returning he repeated what he had heard for the sake of the venerable (Mudgalaputra). On this he understood the meaning of the law and reached the first fruit. Then with 250 followers he went to the place where Buddha was. The Lord of the World, seeing him at a distance, pointing him out, said

to his disciples, “That one coming here will be the first among my followers in the exercise of spiritual faculties (*miraculous powers*).” Having reached the place where Buddha was, he requested to enter the law (*the society*). The Lord replying, said, “Welcome, O Bhikshu; carefully practice a pure life; and you shall escape this limits of sorrow.” Hearing this, his hair fell off, and his common robes were changed into others. Observing in their purity the sections of the rules of moral discipline, and being in his exterior behaviour faultless, after seven days, getting rid of all bonds of sin, he reached the condition of an Arhat and the supernatural powers.

Gautam visits Magadha after becoming Buddha; Bimbisara leads the welcome:

East of the old village of Mudgalaputra, going 3 or 4 *li*, we come to a *stupa*. This is the place where Bimbisara raja went to have an interview with Buddha. When Tathagata first obtained the fruit of a Buddha, knowing that the hearts of the people of Magadha were waiting for him athirst, he accepted the invitation of Bimbisara-raja, and early in the morning, putting on his robes, he took his begging-dish, and with a thousand Bhikshus around him, on the right hand and the left (*he advanced*). In front and behind these there were a number of aged Brahmans who went with twisted hair (*jalina*), and being desirous of the law, wore their dyed garments (*chivara*). Followed by such a throng, he entered the city of Rajagriha.

Then Lord Sakra (*Ti-shih*), king of Devas, changing his appearance into that of a Manava (*Ma-na-p’o*) youth, with a crown upon his head and his hair bound up, in his left hand holding a golden pitcher and in his right a precious staff, he walked above the earth four fingers high, leading Buddha along the road in front, in the midst of the vast assembly. Then the king of the Magadha country, Bimbisara (*Pin-pi-lo*) by name, accompanied by all the Brahman householders within the land, and the merchants (*ku-sse*), 100,000 myriads in all, going before and behind, leading and following, proceeded from the city of Rajagriha to meet and escort the holy congregation.

Sariputra’s birthplace; his mothers’ dream; he became the first to seek nirvana before Buddha:

South-east from the spot where Bimbisara-raja met Buddha, at a distance of about 20 *li*, we come to the town of Kalapinaka (*Kia-lo-pi-na-kia*). In this town is a *stupa* which was built by Asoka-raja. This is the place where Sariputra, the venerable one, was born. The well[377] of the place still exists. By the side of the place is a *stupa.* This is where the venerable one obtained *Nirvana;* the relics of his body, therefore, are enshrined therein. He also was of a high Brahman family. His father was a man of great learning and erudition; he penetrated thoroughly the most intricate questions. There were no books he had not thoroughly investigated. His wife had a dream and told it to her husband. "Last night," said she, "during my sleep my dreams were troubled by a strange man whose body was covered with armour; in his hand he held a diamond mace with which he broke the mountains; departing, he stood at the foot of one particular mountain." "This dream," the husband said, "is extremely good. You will bear a son of deep learning; he will be honoured in the world, and will attack the treatises of all the masters and break down their teaching (*schools*). Being led to consider, he will become the disciple of one who is more than human."

And so in due course she conceived a child. All at once she was greatly enlightened. She discoursed in high and powerful language, and her words were not to be overthrown. When the venerable one began to be eight years old, his reputation was spread in every direction. His natural disposition was pure and simple, his heart loving and compassionate. He broke through all impediments in his way, and perfected his wisdom. He formed a friendship when young with Mudgalaputra, and being deeply disgusted with the world, and having no system to adopt as a refuge, he went with Mudgalaputra to the heretic Sanjaya's abode, and practiced (*his mode of salvation*). Then they said together, "This is not the system of final deliverance, nor is it able to rescue us from the trammels of sorrow. Let us each seek for an illustrious guide. He who first obtains *sweet dew*,[378] let him make the taste common to the other."[379]

At this time the great Arhat Asvajita, holding in his hand his proper measure bowl (*patra*), was entering the city begging for food.

Sariputra seeing his dignified exterior and his quiet and becoming manner, forthwith asked him, "Who is your master?" He answered, "The prince of the Sakya tribe, disgusted with the world, becoming a hermit, has reached

perfect wisdom. This one is my master." Sariputra added, "And what doctrine does he teach? May I find a way to hear it?" He said, "I have but just received instruction, and have not yet penetrated the deep doctrine." Sariputra said, "Pray tell me what you have heard." Then Asvajita, so far as he could, explained it and spoke. Sariputra having heard it, immediately reached the first fruit, and went forthwith with 250 of his followers to the place where Buddha was dwelling.

The Lord of the World seeing him afar off, pointing to him and addressing his followers, said, "Yonder comes one who will be most distinguished for wisdom among my disciples." Having reached the place, he bent his head in worship and asked to be permitted to follow the teaching of Buddha. The Lord said to him, "welcome, O Bhikshu."

Having heard these words, he was forthwith ordained. Half a month after, hearing Buddha preach the law on account of a Brahman[380] called "Long-nails" (*Dirghanakha*), together with other discourses, and understanding them with a lively emotion, he obtained the fruit of an Arhat. After this, Ananda hearing Buddha speak about his *Nirvana,* it was noised abroad and talked about (*by the disciples*). Each one was affected with grief. Sariputra was doubly touched with sorrow, and could not endure the thought of seeing Buddha die. Accordingly, he asked the Lord that he might die first. The lord said, "Take advantage of your opportunity."

He then bade adieu to the disciples and came to his native village. His followers, the Sramaneras, spread the news everywhere through the town and villages. Ajatasatru-raja and his people hastened together as the wind, and assembled in clouds to the assembly, whilst Sariputra repeated at large the teaching of the law. Having heard, it, they went away. In the middle of the following night, with fixed (*correct*) thought, and mind restrained, he entered the *Samadhi* called "final extinction." After awhile, having risen out of it, he died.

BOOK X

Chen-Po- (Champa)

Origin of government in Jambudvipa:

This country (Champa)[381] is about 4000 *li* in circuit. The capital is backed to the north by the river Ganges, it is about 40 *li* round. The soil is level and fertile; it is regularly cultivated and productive; the temperature is mild and warm; the manners of the people simple and honest. There are several tens of *sangharamas,* mostly in ruins, with about 200 priests. They follow the teaching of the Little Vehicle. There are some twenty Deva temples, which sectaries of every kind frequent. The walls of the capital are built of brick, and are several "tens of feet" high. The foundations of the wall are raised on a lofty embankment, so that by their high escarpment, they can defy the attack of enemies. In old times at the beginning of the *kalpa*, when things (*men*) first began, they inhabited dens and caves of the desert. There was no knowledge of dwelling houses. After this, a Devi (*divine woman*) descending in consequence of her previous conduct, was located amongst them. As she sported in the streams of the Ganges, she was affected by a spiritual power, and conceiving, she brought forth four sons, who divided between them the government of Jambudvipa. Each took possession of a district, founded a capital, built towns, and marked out the limits of the frontiers. This was the capital of the country of one of them, and the first of all the cities of Jambudvipa.

Spiritual power of a Hindu temple and cave dwellings:

To the east of the city 140 or 150 *li*, on the south of the river Ganges, is a solitary detached rock,[382] craggy and steep, and surrounded by water. On the top of the peak is a Deva temple; the divine sprits exhibit many miracles (*spiritual indications*) here. By piercing the rock, houses have been made; by leading the streams (*through each*), there is a continual flow of water. There are wonderful trees (*forming*) flowering woods; the large rocks and dangerous precipices are the resort of men of wisdom and virtue; those who go there to see the place are reluctant to return.

KIE-CHU-HOH-KHI-LO (KAJUGHIRA OR KAJINGHARA)

A deserted country, taken over by Siladitya-raja:

This kingdom[383] is about 2000 *li* or so in circuit. The soil is level and loamy; it is regularly cultivated, and produces abundant crops; the temperature is warm; the people are simple in their habits. They greatly esteem men of high talent, and honour learning and the arts. There are six or seven *sangharamas* with about 300 priests; and there are some ten Deva temples frequented by sectaries of all sorts. During the last few centuries the royal line has died out, and the country has been ruled by a neighbouring state, so that the towns are desolate, and most of the people are found scattered in villages and hamlets. On this account, Siladitya-raja, when roaming through Eastern India, built a palace in this place, in which he arranged the affairs of his different states. It was built of branches and boughs for a temporary residence, and burnt on his departure. On the southern frontiers of the country are many wild elephants.

PUN-NA-FA-TAN-NA (PUNDRAVARDDHANA)

A district rich in produce; people revere learning; Jaina monks most numerous:

This country[384] is about 4000 *li* in circuit. Its capital is about 30 *li* round. It is thickly populated. The tanks and public offices and flowering woods are regularly connected at intervals. The soil is flat and loamy, and rich in all kinds of grain-produce. The *Panasa*[385] (*Pan-na-so*) fruit, though plentiful, is highly esteemed. The fruit is as large as a pumpkin. When it is ripe it is of a yellowish-red colour. When divided, it has in the middle many tens of little fruits of the size of a pigeon's egg; breaking these, there comes forth a juice of a yellowish-red colour and of delicious flavour. The fruit sometimes collects on the tree-branches as other clustering fruits, but sometimes at the tree-roots, as in the case of the earth-growing *fu-ling*.[386] The climate is temperate; the people esteem learning. There are about twenty *sangharamas*, with some 3000 priests; they study both the Little and Great Vehicle. There are some hundred Deva temples, where sectaries of different schools congregate. The naked Nirgranthas are the most numerous.

To the west of the capital 20 *li* or so is the *Po-chi-p'o sangharama.* Its courts are light and roomy; its towers and pavilions are very lofty. The priests are about 700 in number; they study the law according to the Great Vehicle. Many renowned priests from Eastern India dwell here…

A spiritually powerful Bodhisattva image:

Not far from this there is a *vihara* in which is a statue of *Kwna-tsz'-tsai* Bodhisattva. Nothing is hid from its divine discernment; its spiritual perception is most accurate; men far and near consult (*this being*) with fasting and prayers.

KIA-MO-LU-PO (KAMARUPA)

A predominantly Hindu country; not a single vihara:

The country of Kamarupa[387] is about 10,000 *li* in circuit. The capital town is about 30 *li*. The land lies low, but is rich, and is regularly cultivated. They cultivate the *Panasa* fruit and the *Na-lo-ki-lo* (*Narikela*)[388] fruit. These trees, though numerous, are nevertheless much valued and esteemed. Water led from the river or from banked-up lakes (*reservoirs*) flows round the towns. The climate is soft and temperate. The manners of the people simple and honest. The men are of small stature, and their complexion a dark yellow. Their language differs a little from that of Mid-India. Their nature is very impetuous and wild; their memories are retentive, and they are earnest in study. They adore and sacrifice to the Devas, and have no faith in Buddha; hence from the time when Buddha appeared in the world even down to the present time there never as yet has been built one *sangharama* as a place for the priests to assemble. Such disciples as there are of a pure faith, say their prayers (*chant the name of Buddha*) secretly, and that is all. There are as many as 100 Deva temples, and different sectaries to the number of several myriads.

Bhaskara-varman patronises the learned; calls the Chinese pilgrim to court:

The present king belongs to the old line (*tso yan)* of Narayana-deva. He is of the Brahman caste. His name is Bhaskara-varman, his title Kumara (*Keu-mo-lo*). From the time that this family seized the land and assumed the government till the present king, there have elapsed a thousand successions (*generations*). The king is fond of learning, and the people are so likewise in imitation of him. Men of high talent from distant regions aspiring after office visit his dominions as strangers. Though he has no faith in Buddha, yet he much respects Sramanas of learning. When he first heard that a Sramana from China had come to Magadha to the Nalanda *sangharama* from such a distance, to study with diligence the profound law of Buddha, he sent a message of invitation by those who reported it as often as three times, but yet the Sramana (Yuan Chwang) had not obeyed it. Then Silabhadra (*Shi-lo-po-‘ t’o-lo*), master of *sastras,* said, “You desire to show your gratitude to Buddha; then you should propagate the true law; this is your duty. You need not fear the long journey. Kumara-raja’s family respect the teaching of the heretics, and now he invites a Sramana to visit him. This is good indeed! We judge from this that he is changing his principles, and desires to acquire merit (*or,* from merit acquired) to benefit others. You formerly conceived a great heart, and made a vow with yourself to travel alone through different lands regardless of life, to seek for the law for the good of the world. Forgetful of your own country, you should be ready to meet death; indifferent to renown or failure, you should labour to open the door for the spread of the holy doctrine, to lead onwards the crowds who are deceived by false teaching, to consider others first, yourself afterwards; forgetful of renown, to think only of religion.”

Yuan Chwang is reluctant, but goes after Silabhadra’s exhortation; Bhaskara-varman asks about the Tsin king:

On this, with no further excuses, he hastened in company with the messengers to present himself to the king. Kumara-raja said, “Although I am without talents myself, I have always been fond of men of conspicuous learning. Hearing, then, of your fame and distinction, I ventured to ask you here to visit me.”

He replied, “I have only moderate wisdom, and I am confused to think that you should have heard of my poor reputation.”

Kumara-raja said, “Well, indeed! From regard for the law and love of learning to regard oneself as of no account, and to travel abroad regardless of so great dangers, to wander through strange countries! This is the result of the transforming power of the king’s government, and the exceeding learning, as is reported, of the country. Now, through the kingdoms of India there are many persons who sing about the victories of the Tsin king of the Mahachina country. I have long heard of this. And is it true that this is your honourable birthplace?”

He said, “It is so. These songs celebrate the virtues of my sovereign.”

He (the king) replied, “I could not think that your worthy self was of this country. I have ever had esteem for its manners and laws. Long have I looked towards the east, but the intervening mountains and rivers have prevented me from personally visiting it.”

In answer I said, “My great sovereign’s holy qualities are far renowned, and the transforming power of his virtue reaches to remote districts. People from strange countries pay respect at the door of his palace, and call themselves his servants.”

Kumara-raja said, "If his dominion is so great (*covering thus his subjects*), my heart strongly desires to bear my tribute to his court. But now Siladitya-raja is in the country of Kajughira (*Kie-chu-hoh-khi-lo*), about to distribute large alms and to plant deeply the root of merit and wisdom. The Sramans and Brahmans of the five Indies, renowned for their learning, must needs come together. He has now sent for me. I pray you go with me!"

On this they went together.

SAN-MO-TA-CHA (SAMATATA)

A prosperous and cultured district; mixed population; Jainas dominant:

This country (Eastern Bengal) is about 3000 *li* in circuit and borders on the great sea. The land lies low and is rich. The capital is about 20 *li* round. It is regularly cultivated, and is rich in crops, and the flowers and fruits grow everywhere. The climate is soft and the habits of the people agreeable. The men are hardy by nature, small of stature, and of black complexion; they are fond of learning, and exercise themselves diligently in the acquirement of it. There are professors both of false and true doctrines. There are thirty or so *sangharamas* with about 2000 priests. They are all of the Sthavira (*Shang-tso-pu*) school. There are some hundred Deva temples, in which sectaries of all kinds live. The naked ascetics called Nirgranthas (*Ni-kien*) are most numerous.

Not far from this, in a *sangharama,* is a figure of Buddha of green jade. It is eight feet high, with the marks on its person perfectly shown, and with a spiritual power which is exercised from time to time.

TAN-MO-LI-TI (TAMRALIPTI)

Rich country and mixed population:

This country[389] is 1400 or 1500 *li* in circuit, the capital about 10 *li*. It borders on the sea. The ground is low and rich; it is regularly cultivated, and produces flowers and fruits in abundance. The temperature is hot. The manners of the people are quick and hasty. The men are hardy and brave. There are both heretics and believers. There are about ten *sangharamas,*

with about 1000 priests. The Deva temples are fifty in number, in which various sectaries dwell mixed together. The coast of this country is formed by (or in) a recess of the sea; the water and the land embracing each other.[390] Wonderful articles of value and gems are collected here in abundance, and therefore the people of the country are in general very rich.

KIE-LO-NA-SU-FA-LA-NA (KARNASUVARNA)

Rich country and mixed population; people love learning:

This kingdom is about 1400 or 1500 *li* in circuit; the capital is about 20 *li*. It is thickly populated. The householders are very (*rich and in ease*). The land lies low and is loamy. It is regularly cultivated, and produces an abundance of flowers, with valuables numerous and various. The climate is agreeable; the manners of the people honest and amiable. They love learning exceedingly, and apply themselves to it with earnestness. There are believers and heretics alike amongst them. There are ten *sangharamas* or so, with about 2000 priests. They study the Little Vehicle of the Sammatiya (*Ching-tiang-pu*) school. There are fifty Deva temples. The heretics are very numerous. Besides these there are three *sangharamas* in which they do not use thickened milk (*u lok*), following the directions of Devadatta (*Ti-p'o-ta-to*).[391]

By the side of the capital is the *sangharama* called *Lo-to-wei-chi* (*Raktaviti*, 'red mud'), the halls of which are light and spacious, the storeyed towers very lofty. In this establishment congregate all the most distinguished, learned, and celebrated men of the kingdom. They strive to promote each other's advancement by exhortations, and to perfect their character.

U-cha (UDRA)

Rich country, uncivilised people, but dedicated to learning:

This country (Utkal, Orissa) is 7000 *li* or so in circuit; the capital city[392] is about 20 *li* round. The soil is rich and fertile, and it produces abundance of grain, and every kind of fruit is grown more than in other countries. It

would be difficult to name the strange shrubs and the famed flowers that grow here. The climate is hot; the people are uncivilised, tall of stature, and of a yellowish black complexion. Their words and language (*pronunciation*) differ from Central India. They love learning and apply themselves to it without intermission. Most of them believe in the law of Buddha. There are some hundred *sangharamas,* with 10,000 priests. They all study the Great Vehicle. There are fifty Deva temples in which sectaries of all sorts make their abodes. The *stupas*, to the number of ten or so, point out spots where Buddha preached. They were all founded by Asoka-raja.

In a great mountain on the south-west frontiers of the country is *sangharama* called Pushpagiri (*Pu-se-po-k'i-li*);[393] the stone *stupa* belonging to it exhibits very many spiritual wonders. On fast-days it emits a bright light. For this cause believers from far and near flock together here and present as offerings beautifully embroidered canopies; they place these underneath the vase at the top of the cupola, and let them stand there fixed as needles in the stone. To the north-west of this, in a convent on the mountain, is a *stupa* where the same wonders occur as in the former case. These two *stupas* were built by the demons,[394] and hence are derived the extraordinary miracles.

KONG-U'T'O (Konyodha?)

A predominantly Hindu land:

This kingdom[395] is about 1000 *li* in circuit; the capital is 20 *li* round. It borders on a bay. The ranges of mountains are high and precipitous. The ground is low and moist. It is regularly cultivated and productive. The temperature is hot, the disposition of the people brave and impulsive. The men are tall of stature and black complexioned and dirty. They have some degree of politeness and are tolerably honest. With respect to their written characters, they are the same as those of Mid-India, but their language and mode of pronunciation are quite different. They greatly respect the teaching of heretics and do not believe in the law of Buddha. There are some hundred Deva temples, and there are perhaps 10,000 unbelievers of different sects.

Within the limits of this country there are several tens of small towns which border on the mountains and are built contiguous to the sea. The cities themselves are strong and high; the soldiers are brave and daring; they rule by force the neighbouring provinces, so that no one can resist them. This country, bordering on the sea, abounds in many rare and valuable articles. They use cowrie shells and pearls in commercial transactions. The great greenish-blue elephant comes from this country. They harness it to their conveyances and make very long journeys.

KIE-LING-KIA (KALINGA)

Land and people, most Hindus and Jainas:

This country is 5000 *li* or so in circuit; its capital is 20 *li* or so round. It is regularly cultivated and is productive. Flowers and fruits are very abundant. The forests and jungle are continuous for many hundred *li*. It produces the great tawny wild elephant, which are much prized by neighbouring provinces. The climate is burning; the disposition of the people vehement and impetuous. Though the men are mostly rough and uncivilised, they still keep their word and are trustworthy. The language is light and tripping, and their pronunciation distinct and correct. But in both particulars, that is, as to words and sounds, they are very different from Mid-India. There are a few who believe in the true law, but most of them are attached to heresy. There are ten *sangharamas,* with about 500 priests, who study the Great Vehicle according to the teaching of the Sthavira school. There are some 100 Deva temples with very many unbelievers of different sorts, the most numerous being the Nirgranthas (Jainas).

KIAO-SA-LO (KOSALA)

Land, people, and Bodhisattva Nagarjuna:

This country[396] is about 5000 *li* in circuit; the frontiers consist of encircling mountain crags; forests and jungle are found together in succession. The capital is about 40 *li* round; the soil is rich and fertile, and yields abundant crops. The towns and villages are close together, the population is very dense. The men are tall and black complexioned. The

disposition of the people is hard and violent; they are brave and impetuous. There are both heretics and believers here. They are earnest in study and of a high intelligence. The king is of the Kshattriya race; he greatly honours the law of Buddha, and his virtue and love are far renowned. There are about one hundred *sangharamas,* and somewhat less than 10,000 priests: they all alike study the teaching of the Great Vehicle. There are about seventy Deva temples, frequented by heretics of different persuasions.

Not far to the south of the city is an old *sangharama,* by the side of which is a *stupa* that was built by Asoka-raja. In this place Tathagata, of old, calling an assembly, exhibited his supernatural power and subdued the unbelievers. Afterwards Nagarjuna Bodhisattva (*Longmeng-p'u-sa*) dwelt in the *sangharama.* The king of the country was then called Sadvaha. He greatly prized and esteemed Nagarjuna, and provided him with a city-gate hut.

On the mystical powers of Nagarjuna and his longevity:

Nagarjuna Bodhisattva was well practiced in the art of compounding medicines; by taking a preparation he nourished the years of life for many hundreds of years,[397] so that neither the mind nor appearance decayed. Sadvaha-raja had partaken of this mysterious medicine, and his years were already several hundred in number. The king had a young son who one day addressed his mother thus, "When shall I succeed to the royal estate?" His mother said, "There seems to me to be no chance of that yet; your father the king is now several hundred years old, his sons and grandsons are many of them dead and gone through old age. This is the result of the religious power of Nagarjuna, and the intimate knowledge he has of compounding medicines. The day the Bodhisattva dies the king will also succumb. Now the wisdom of this Nagarjuna is great and extensive, and his love and compassion very deep; he would give up for the benefit of living creatures his body and life. You ought, therefore, to go, and when you meet him, ask him to give you his head. If you do this, then you will get your desire."

The king's son, obedient to his mother's instructions, went to the gate of the convent. The doorkeeper, alarmed, ran away, and so he entered at once. Then Nagarjuna Bodhisattva was chanting as he walked up and down. Seeing the king's son he stopped, and said, "It is evening time now; why do

you at such a time come so hastily to the priests' quarters? Has some accident happened, or are you afraid of some calamity that you have hastened here at such a time?"

He answered, "I was considering with my dear mother the words of different *sastras,* and the examples (*therein*) of sages who had forsaken the world, and I was led to remark on the great value set on life by all creatures, and that the scriptures, in their examples given of sacrifice, had not enforced this duty of giving up life readily for the sake of those who desired it. Then my dear mother said, "Not so; the Sugatas (*shen shi*) of the ten regions, the Tathagatas of the three ages, whilst living in the world and giving their hearts to the objects, have obtained the fruit. They diligently sought the way of Buddha; practicing the precepts, exercising patience, they gave up their bodies to feed wild beasts, cut their flesh to deliver the dove. Thus Raja Chandraprabha (*Yueh-kwang*) gave up his head to the Brahman; Maitribala (*Ts'e li)* raja fed the hungry Yaksha with his blood. To recite every similar example would be difficult, but in searching through the history of previous sages, what age is there that affords not examples? And so Nagarjuna Bodhisattva is now actuated by similar high principles; as for myself, I have sought a man who for my advantage would give me his head, but have never yet found such a person for years. If I had wished to act with violence and take the life of a man (*commit murder*), the crime would have been great and entailed dreadful consequences. To have taken the life of an innocent child would have been infamous and disgraced my character. But the Bodhisattva diligently practices the holy way and aspires after a while to the fruit of the Buddha. His love extends to all beings and his goodness knows no bounds. He esteems life as a bubble, his body as decaying wood. He would not contradict his purpose in refusing such a gift, if requested."

Nagarjuna agrees to relinquish his life for the king's son:

Nagarjuna said, "Your comparisons and your words are true. I seek the holy fruit of a Buddha. I have learnt that a Buddha is able to give up all things, regarding the body as an echo, a bubble, passing through the four forms of life,[398] continually coming and going in the six ways.[399] My constant vow has been not to oppose the desires of living things. But there is one difficulty in the way of the king's son, and what is that? If I were to

give up my life your father also would die. Think well of this, for who could then deliver him."

Nagarjuna, irresolute, walked to and fro, seeking for something to end his life with; then taking a dry reed leaf, he cut his neck as if with a sword, and his head fell from his body.

Having seen this, he (*the prince*) fled precipitately and returned. The guardian of the gate informed the king of the event from first to last, who whilst listening was so affected that he died.

T'O-NA-KIE-TSE-KIA (DHANAKATAKA)

This country is about 6000 *li* in circuit, and the capital (Bejwada) some 40 *li* round. The soil is rich and fertile, and is regularly cultivated, affording abundant harvests. There is much desert country, and the towns are thinly populated. The climate is hot. The complexion of the people is a yellowish black, and they are by nature fierce and impulsive. They greatly esteem learning. The convents (*sangharamas*) are numerous, but are mostly deserted and ruined; of those preserved there are about twenty, with 1000 or so priests. They all study the law of the Great Vehicle. There are 100 Deva temples, and the people who frequent them are numerous and of different beliefs.

Bhavaviveka awaits Maitreya Bodhisattva; fails to discourse with Dharmapala:

To the south[400] of the city a little way is a great mountain cavern. It is here the master of *sastras P'o-pi-fei-kia* (Bhavaviveka) remains in the palace of the Asuras (*'O-ssu-lo*), awaiting the arrival of Maitreya Bodhisattva as perfect Buddha. This master of *sastras* was widely renowned for his elegant scholarship and for the depth of his vast attainments (*virtue*). Externally he was a disciple of Kapila (Sankhya), but inwardly he was fully possessed of the learning of Nagarjuna. Having heard that Dharmapala (*Hu-fa-p'u-sa*) of Magadha was spreading aboard the teaching of the law, and was making many thousand disciples, he desired to discuss with him. He took his religious staff in hand and went. Coming to Pataliputra (*Po-ch'a-li*) he ascertained that Dharmapala Bodhisattva was dwelling at the *Bodhi* tree. Then the master of *sastra*s ordered his disciples thus: "Go you to the place

where Dharmapala resides near the *Bodhi* tree, and say to him in my name, 'Bodhisattva (i.e. Dharmapala) published abroad the doctrine (*of Buddha*) bequeathed to the world: he leads and directs the ignorant. His followers look up to him with respect and humility, and so it has been for many days; nevertheless his vow and past determination have borne no fruit! Vain is it to worship and visit the *Bodhi* tree. Swear to accomplish your object, and then you will be in the end guide of gods and men."[401]

Dharmapala Bodhisattva answered the messenger thus: "The lives of men (*or, generations of men*) are like a phantom; the body is as a bubble. The whole day I exert myself; I have no time for controversy; you may therefore depart – there can be no meeting."

The master of *sastras* having returned to his own country, led a pure (*quiet*) life and reflected thus: "In the absence of Maitreya as a Buddha, who is there that can satisfy my doubts?" Then in front of the figure of the Bodhisattva *Kwan-tsz'-tsai*,[402] he recited in order the *Sin-to'-lo-ni* (*Hridaya-dharani*), abstaining from food and drink. After three years *Kwan-tsz'-tsai* Bodhisattva appeared to him with a very beautiful body, and addressed the master of *sastras* thus: "What is your purpose (*will*)?" He said, "May I keep my body till Maitreya comes." *Kwan-tsz'-tsai* Bodhisattva said, "Man's life is subject to many accidents. The world is as a bubble or a phantom. You should aim at the highest resolve to be born in the Tushita heaven, and there, even now, to see him face to face and worship."

The master of *sastras* said, "My purpose is fixed; my mind cannot be changed." Bodhisattva said, "If it is so, you must go to the country of Dhanakataka, to the south of the city, where in a mountain cavern a diamond-holding (*Vajrapani*) spirit dwells, and there with the utmost sincerity reciting the *Chi-king-kang-t'o-lo-ni (Vajrapanidharani),* you ought to obtain your wish."

On this the master of *sastras* went and recited (the *dharani).* After three years the spirit said to him, "What is your desire, exhibiting such earnest diligence?" The master of *sastras* said, "I desire that my body may endure till Maitreya comes, and Avalokitesvara Bodhisattva directed me to come here to request the fulfilment (*of my desire*). Does this rest with you, divine being?"

The spirit then revealed to him a formula and said, “There is an Asura’s palace in this mountain; if you ask according to the rule given you, the walls will open, and then you may enter and wait there till you see (*Maitreya*).” “But,” said the master of *sastras*, “dwelling in the dark, how shall I be able to see or know when the Buddha appears?” Vajrapani said, “When Maitreya comes into the world, I will then advise you of it.” The master of *sastras* having received his instruction, applied himself with earnestness to repeat the sentences, and for three years, without any change of mind, he repeated the words to a nicety (*perfectly*). Then knocking at the rock-cavern, it opened out its deep and vast recesses. Then an innumerable multitude appeared before him looking about them, but forgetful of the way to return. The master of *sastras* passed through the door, and addressing the multitude said, “Long have I prayed and worshipped with a view to obtain an opportunity to see Maitreya. Now, thanks to the aid of a spiritual being, my vow is accomplished. Let us therefore enter here, and together await the revelation of this Buddha.”

Those who heard this were stupefied, and dared not pass the threshold. They said, “This is a den of serpents; we shall all be killed.” Thrice he addressed them, and then only six persons were content to enter with him. The master of *sastras* turning himself and advancing, then all the multitude followed him with their gaze as he entered. After doing so the stone wall closed behind them, and then those left without chided themselves for neglecting his words addressed to them.

CHU-LI-YE (CHULYA OR CHOLA)

Not a great place at the time of the pilgrim:

The country of Chulya (Chola) is about 2400 or 2500 *li* in circuit; the capital is about 10 *li* round. It is deserted and wild, a succession of marshes and jungle. The population is very small, and troops of brigands go through the country openly. The climate is hot; the manners of the people dissolute and cruel. The disposition of the men is naturally fierce; they are attached to heretical teaching. The *sangharamas* are ruined and dirty as well as the priests. There are some tens of Deva temples, and many Nirgrantha heretics.

TA-LO-PI-CH’A (DRAVIDA)

Speaks highly of character and learning of the people; birthplace of Dharmapala Bodhisattva:

This country is about 6000 *li* in circuit; the capital of the country is called Kanchipura (Kanjivaram, *Kin-chi-pu-lo*), and is about 30 *li* round. The soil is fertile and regularly cultivated, and produces abundance of grain. There are also many flowers and fruits. It produces precious gems and other articles. The climate is hot, the character of the people courageous. They are deeply attached to the principles of honesty and truth, and highly esteem learning; in respect of their language and written characters, they differ but little from those of Mid-India. There are some hundreds of *sangharamas* and 10,000 priests. They all study the teaching of the Sthavira (*Chang-tso-pu*) school belonging to the Great Vehicle. There are some eighty Deva temples, and many heretics called Nirgranthas. Tathagata in olden days, when living in the world, frequented this country much; he preached the law here and converted men, and therefore Asoka-raja built *stupas* over all the sacred spots where these traces exist. The city of Kanchipura is the native place of Dharmapala Bodhisattva. He was the eldest son of a great minister of the country. From his childhood he exhibited much clearness, and as he grew up it increased and extended. When he became a young man, the king and queen condescended to entertain him at a (*marriage*) feast. On the evening of the day his heart was oppressed with sorrow, and being exceedingly afflicted, he placed himself before a statue of Buddha and engaged in earnest prayer. Moved by his extreme sincerity, the spirits removed him to a distance, and there he hid himself. After going many hundred *li* from this spot he came to a mountain convent, and sat down in the hall of Buddha. A priest happening to open the door, and seeing this youth, was in doubt whether he was a robber or not. After interrogating him on the point, the Bodhisattva completely unbosomed himself and told him the cause; moreover he asked permission to become a disciple. The priests were much astonished at the wonderful event, and forthwith granted his request. The king ordered search to be made for him in every direction, and at length finding out that Bodhisattva had removed to a distance from the world, driven by the spirit (*or,* spirits), then he redoubled his deep reverence and admiration for him. From the time that Dharmapala assumed the robes of a recluse, he applied himself with unflagging earnestness to learning.

MO-LO-KIU-CH'A (MALAKUTA)

This country is about 5000 *li* in circuit; the capital is about 40 *li*. The land and fields are impregnated with salt, and the produce of the earth is not abundant. All the valuables that are collected in the neighbouring islets are brought to this country and analysed. The temperature is very hot. The men are dark complexioned. They are firm and impetuous in disposition. Some follow the true doctrine, others are given to heresy. They do not esteem learning much, but are wholly given to commercial gain. There are the ruins of many old convents, but only the walls are preserved, and there are few religious followers. There are many hundred Deva temples, and a multitude of heretics, mostly belonging to the Nirgranthas.

The camphor and other trees:

On the south of this country, bordering the sea, are the *Mo-la-ye* mountains,[403] remarkable for their high peaks and precipices, their deep valleys and mountain torrents. Here is found the white sandal-wood tree and the *Chan-t'an-ni-p'o* (*Chandaneva*, like sandalwood) tree. These two are much alike, and the latter can only be distinguished by going in the height of summer on the top of some hill, and then looking at a distance, great serpents may be seen entwining it: thus it is known. Its wood is naturally cold, and therefore serpents twine round it. After having noted the tree, they shoot an arrow into it to mark it. In the winter, after the snakes have gone, the tree is cut down. The tree from which *Kie-pu-lo* (*Karpura*, camphor) scent is procured, is in trunk like the pine, but different leaves and flowers and fruits. When the tree is first cut down and sappy, it has no smell; but when the wood gets dry, it forms into veins and splits; then in the middle is the scent, in appearance like mice, of the colour of frozen snow. This is what is called (in Chinese) *long-nao-hiang,* the dragon-brain scent.

BOOK XI

SANG-KIA-LO (SIMHALA)

On the mission of Asoka's brother, Mahendra:

The kingdom of Simhala formerly was addicted to immoral religious worship, but after the first hundred years following Buddha's death the younger brother of Asoka-raja, Mahendra by name, giving up worldly desires, sought with ardour the fruit of Arhatship. He gained possession of the six supernatural powers and the eight means of liberation; and having the power of instant locomotion, he came to this country. He spread the knowledge of the true law and widely diffused the bequeathed doctrine. From his time there has fallen on the people a believing heart, and they have constructed 100 convents, containing some 20,000 priests. They principally follow the teaching of Buddha, according to the *dharma* of the Sthavira (*Shang-ts'o-pu*) school of the Mahayana sect. When 200 years had elapsed,[404] through discussion, the one school was divided into two. The former, called the Mahaviharavasinas (*Mo-ho-pi-ho-lo-chu-pu*),[405] was opposed to the Great Vehicle and adhered to the teaching of the Little Vehicle; the other was called Abhayagirivasinas (*O-p'o-ye-k'i-li-chu-pu*);[406] they studied both vehicles, and widely diffused the *Tripitakas*. The priests attended to the moral rules, and were distinguished for their power of abstraction and their wisdom. Their correct conduct was an example for subsequent ages; their manners grave and imposing.

By the side of the king's palace is the *vihara* of Buddha's tooth, several hundred feet high, brilliant with jewels and ornamented with rare gems. Above the *vihara* is placed an upright pole on which is fixed a great Padma raja (*ruby*) jewel. This gem constantly sheds a brilliant light, which is visible night and day for a long distance, and afar off appears like a bright star. The king three times a day washes the tooth of Buddha with perfumed water, sometimes with powdered perfumes. Whether washing or burning, the whole ceremony is attended with a service of the most precious jewels.

KONG-KIN-NA-PU-LO (KONKANAPURA)

This country is about 5000 *li* in circuit. The capital is 3000[407] *li* or so round. The land is rich and fertile; it is regularly cultivated, and produces large crops. The climate is hot; the disposition of the people ardent and quick. Their complexion is black, and their manners fierce and uncultivated. They love learning, and esteem virtue and talent. There are about 100

sangharamas, with some 10,000 priests. They study both the Great and the Little Vehicle. They also highly reverence the Devas, and there are several hundred temples in which many sectaries dwell together.

By the side of the royal palace is a great *sangharama* with some 300 priests, who are all men of distinction. This convent has a great *vihara,* a hundred feet and more in height. In it is a precious tiara belonging to Sarvarthasidda (*Yih-tsai-i-sh'ing*) the prince. It is somewhat less than two feet in height, and is ornamented with gems and precious stones. It is kept in a jewelled casket. On fast-days it is brought out and placed on a high throne. They offer to it flowers and incense, on which occasions it is lit up with radiance.

Tala tree leaves used for writing:

To the north of the city not far is a forest of *Tala* trees about 30 *li* round. The leaves are long and broad, their colour shining and glistening. In the countries of India these leaves are everywhere used for writing on. In the forest is a *stupa*. Here the four former Buddhas sat down and walked for exercise, and traces of them still remain. Beside this is a *stupa* containing the bequeathed relics of the Arhat Srutavimsatikoti.

MO-HO-LA-CH'A (MAHARASHTRA)

Strong character of the people:

This country is about 5000 *li* in circuit. The capital[408] borders on the west on a great river. It is about 30 *li* round. The soil is rich and fertile; it is regularly cultivated and very productive. The climate is hot; the disposition of the people is honest and simple; they are tall of stature, and of a stern, vindictive character. To their benefactors they are grateful; to their enemies relentless. If they are insulted, they will risk their life to avenge themselves. If they are asked to help one in distress, they will forget themselves in their haste to render assistance. If they are going to seek revenge, they first give their enemy warning; then, each being armed, they attack each other with lances (*spears*). When one turns to flee, the other pursues him, but they do not kill a man down (*who submits*). If a general loses a battle, they do not inflict punishment, but present him with woman's clothes, and so he is

driven to seek death for himself. The country provides for a band of champions to the number of several hundred. Each time they are about to engage in conflict they intoxicate themselves with wine, and then one man with lance in hand will meet ten thousand and challenge them in fight. If one of these champions meets a man and kills him, the laws of the country do not punish him. Every time they go forth they beat drums before them. Moreover, they inebriate many hundred heads of elephants, and, taking them out to fight, they themselves first drink their wine, and then rushing forward in mass, they trample everything down, so that no enemy can stand before them.

King Pulakesi - Siladitya could not subjugate him:

The king, in consequence of his possessing these men and elephants, treats his neighbours with contempt. He is of the Kshattriya caste, and his name is Pulakesi (*Pu-lo-ki-she*). His plans and undertakings are wide-spread, and his beneficent actions are felt over a great distance. His subjects obey him with perfect submission. At the present time Siladitya Maharaja (of Kanauj) has conquered the nations from east to west, and carried his arms to remote districts, but the people of this country alone have not submitted to him. He has gathered troops from the five Indies, and summoned the best leaders from all countries, and himself gone at the head of his army to punish and subdue these people, but he has not yet conquered their troops.

So much for their habits. The men are fond of learning, and study both heretical and orthodox (*books*). There are about 100 *sangharamas,* with 5000 or so priests. They practice both the Great and Small Vehicle. There are about 100 Deva temples, in which very many heretics of different persuasions dwell.

On the eastern frontier of the country is a great mountain with towering crags and a continuous stretch of piled-up rocks and scarped precipice. In this there is a *sangharama* constructed, in a dark valley. Its lofty halls and deep side-aisles stretch through the (*or* open into the) face of the rocks. Storey above storey they are backed by the crag and face the valley.[409]

This convent was built by the Arhat Achara (*O'che-lo*).[410] This Arhat was a man of Western India. His mother having died, he looked to see in what condition she was re-born. He saw that she had received a woman's body in

this kingdom. The Arhat accordingly came here with a view of convert her, according to her capabilities of receiving the truth. Having entered a village to beg food, he came to the house where his mother had been born. A young girl came forth with food to give him. At this moment the milk came from her breasts and trickled down. Her friends having seen this considered it an unlucky sign, but the Arhat recounted the history of her birth. The girl thus attained the holy fruit (*of Arhatship*). The Arhat, moved with gratitude for her who had borne and cherished him, and remembering the end of such (*good*) works, from a desire to requite her, built this *sangharama.* The great *vihara* of the convent is about 100 feet or so in height; in the middle is a stone figure of Buddha about 70 feet or so high. Above it is a stone canopy of seven stages, towering upwards apparently without support. The space between each canopy[411] is about three feet. According to the old report, this is held in its place by the force of the vow of the Arhat. They also say it is by the force of his miraculous powers; others say by the virtue of some magical compound; but no trustworthy account has yet explained the reason of the wonder. On the four sides of the *vihara,* on the stone walls, are painted different scenes in the life of Tathagata's preparatory life as a Bodhisattva: the wondrous signs of good fortune which attended his acquirement of the holy fruit (*of a Buddha*), and the spiritual manifestations accompanying his *Nirvana*. These scenes have been cut out with the greatest accuracy and fineness (*in the Ajanta frescoes*). On the outside of the gate of the *sangharama,* on the north and south side, at the right hand and the left, there is a stone elephant.[412] The common report says that sometimes these elephants utter a great cry and the earth shakes throughout. In old days Jina (*or* Channa) Bodhisattva often stopped in this *Sangharama*.

MO-LA-P'O (MALAVA)

The great learning of the people:

This country is about 6000 *li* in circuit. The capital is some 30 *li* round. It is defended by the Mahi river on the south and east (Dongarpur or Dharanagara). The soil is rich and fertile, and produces abundant harvests. Shrubs and trees are numerous and flourishing. Flowers and fruit are met with in great quantities. The soil is suitable in an especial manner for winter

wheat. They mostly eat biscuits and (*or,* made of) parched corn-flour. The disposition of the men is virtuous and docile, and they are in general of remarkable intelligence. Their language is elegant and clear, and their learning is wide and profound.

Two countries in India, on the borders, are remarkable for the great learning of the people, viz., Malava on the south-west, and Magadha on the north-east. In this they esteem virtue and respect politeness. They are of an intelligent mind and exceedingly studious; nevertheless the men of this country are given to heretical belief as well as the true faith, and so live together. There are about 100 *sangharamas* in which some 2000 priests dwell. They study the Little Vehicle, and belong to the Sammatiya school. There are 100 Deva temples of different kinds. The heretics are very numerous, but principally the Pasupatas (*ash-covered*).

Siladitya raja of Malava:

The records of the country state: Sixty years before this flourished Siladitya, a man of eminent wisdom and great learning; his skill in literature was profound. He cherished and protected the four kinds of creatures, and deeply respected the three treasures. From the time of his birth to his last hour, his face never crimsoned with anger, nor did his hands ever injure a living thing. His elephants and horses drank water that had been strained, after which he gave it them, lest any creature living in the water should be injured. Such were his love and humanity. During the fifty years and more of his reign, the wild beasts became familiar with men, and the people did not injure or slay them. By the side of his palace he built a *vihara.* He exhausted the skill of the artists, and used every kind of ornament in decorating it. In it he put images of the seven Buddhas, Lords of the World. Every year he convoked an assembly called *Moksha mahaparishad,* and summoned the priests of the four quarters. He offered them "the four things" in religious charity; he also gave them sets of three garments used in their religious services, and also bestowed on them the seven precious substances and jewels in wonderful variety. This meritorious custom has continued in practice without interruption till now.

'O-CH'A-LI (ATALI)

Commerce, not agriculture, mainstay of people; no faith in Buddha:

This country is about 6000 *li* in circuit; the capital of the country is about 20 *li* or so in circuit. The population is dense; the quality of gems and precious substances stored up is very great; the produce of the land is sufficient for all purposes, yet commerce is their principal occupation. The soil is salt and sandy, the fruits and flowers are not plentiful. The country produces the *hutsian* tree. The leaves of this tree are like those of the Sz'chuen pepper (*Shuh tsiau*); it also produces the *hiun-lu* perfume tree, the leaf of which is like the *thang-li*. The climate is warm, windy, and dusty. The disposition of the people is cold and indifferent. They esteem riches and despise virtue. Respecting their letters, language, and the manners and figures of the people, these are much the same as in the country of Malava. The greater part of the people have no faith in the virtue of religious merit; as to those who do believe, they worship principally the spirits of heaven, and their temples are some thousand in number, in which sectaries of different characters congregate.

FA-LA-PI (VALABHI)

Rich country, mixed population:

This country is 6000 *li* or so in circuit, the capital about 30 *li*. The character of the soil, the climate, and manners of the people are like those of the kingdom of Malava. The population is very dense; the establishment rich. There are some hundred houses (*families*) or so, who possess a hundred lakhs. The rare and valuable products of distant regions are here stored in great quantities. There are some hundred *sangharamas,* with about 6000 priests. Most of them study the Little Vehicle, according to the Sammatiya school. There are several hundred Deva temples with very many sectaries of different sorts.

King Dhruvapata, nephew of Siladitya-raja of Malava, believes in Buddha:

The present king is of the Kshattriya caste, as they all are. He is the nephew of Siladitya-raja of Malava, and son-in-law of the son of Siladitya, the present king of Kanyakubja. His name is Dhruvapata (*T'u-lu-h'o-po-tu*).

He is of a lively and hasty disposition, his wisdom and statecraft are shallow. Quite recently he has attached himself sincerely to faith in the three "precious ones." Yearly he summons a great assembly, and for seven days gives away most valuable gems, exquisite meats, and on the priests he bestows in charity the three garments and medicaments, or their equivalent in value, and precious articles made of rare and costly gems of the seven sorts. Having given these in charity, he redeems them at twice their price. He esteems virtue and honours the good; he reverences those who are noted for their wisdom. The great priests who come from distant regions he particularly honours and respects.

Not far from the city is a great *sangharama* which was built by the Arhat Achara (*'O-che-lo*);[413] here the Bodhisattvas Gunamati and Sthiramati (*Kien-hwui*)[414] fixed their residences during their travels and composed treatises which have gained a high renown.

SU-LA-CH'A (SURASHTRA)

Population mixed; people do not care for learning:

This country is 4000 *li* or so in circuit, the capital about 30 *li*. On the west the chief town borders on the Mahi river; the population is dense, and the various establishments (*families*) are rich. The country is dependent on Valabhi. The soil is impregnated with salt; flowers and fruit are rare. Although the climate is equable, yet there is no cessation of tempests. The manners of the people are careless and indifferent; their disposition light and frivolous. They do not love learning and are attached both to the true faith and also to heretical doctrine. There are some fifty *sangharamas* in this kingdom, with about 3000 priests; they mostly belong to the Sthavira school of the Great Vehicle. There are a hundred or so Deva temples, occupied by sectaries of various sorts. As this country is on the western sea route, the men all derive their livelihood from the sea and engage in commerce and exchange of commodities.

Not far from the city is a mountain called *Yuh-chen-to* (Ujjanta),[415] on the top of which is a *sangharama.* The cells and galleries have mostly been excavated from the mountain-side. The mountain is covered with thick

jungle and forest trees, whilst streams flow round its limits. Here saints and sages roam and rest, and Rishis embued with spiritual faculties congregate here and stay.

KIU-CHE-LO (GURJJARA)

Rich country; mostly Hindu:

This country is 5000 *li* or so in circuit, the capital, which is called *Pi-lo-mo-lo*,[416] is 30 *li* or so round. The produce of the soil and the manners of the people resemble those of Surashtra. The population is dense; the establishments are rich and well supplied with materials (*wealth*). They mostly are unbelievers; a few are attached to the law of Buddha. There is one *sangharama,* with about a hundred priests; they are attached to the teaching of the Little Vehicle and the school of the Sarvastivadas. There are several tens of Deva temples, in which sectaries of various denominations dwell. The king is of the Kshattriya caste. He is just twenty years old; he is distinguished for wisdom, and he is courageous. He is a deep believer in the law of Buddha; and highly honours men of distinguished ability.

U-SHE-YEN-NA (UJJAYANI)

This country (Avanti, Malava) is about 6000 *li* in circuit; the capital is some 30 *li* round. The produce and manners of the people are like those of the country of Surashtra. The population is dense and the establishments wealthy. There are several tens of convents, but they are several tens of Deva temples, occupied by sectaries of various kinds. The king belongs to the Brahman caste. He is well versed in heretical books, and believes not in the true law.

MO-HI-SHI-FA-LO-PU-LO (MAHESVARAPURA)

This kingdom is about 3000 *li* in circuit; the capital city is some 30 *li* round. The produce of the soil and the manners of the people are like those of the kingdom of Ujjayani. They greatly esteem the heretics and do not reverence the law of Buddha. There are several tens of Deva temples, and

the sectaries principally belong to the Pasupatas. The king is of the Brahman caste; he places but little faith in the doctrine of Buddha.

From this, going in a backward direction to the country of *Kiu-che-lo* (Gurjjara) and then proceeding northward through wild deserts and dangerous defiles about 1900 *li*, crossing the great river *Sin-tu*, we come to the kingdom of *Sin-tu* (Sindh).

SIN-TU (SINDH)

The different types of salt; Buddhist land:

This country is about 700 *li* in circuit; the capital city, called *P'i-shen-p'o-pu-lo*, is about 30 *li* round. The soil is favourable for the growth of cereals and produces abundance of wheat and millet. It also abounds in gold and silver and native copper. It is suitable for the breeding of oxen, sheep, camels, mules, and other kinds of beasts. The camels are small in size and have only one hump. They find here a great quantity of salt, which is red like cinnabar; also white salt, black salt and rock salt. In different places, both far and near, this salt is used for medicine. The disposition of the men is hard and impulsive; but they are honest and upright, they quarrel and are much given to contradiction. They study without aiming to excel; they have faith in the law of Buddha. There are several hundred *sangharamas*, occupied by about 10,000 priests. They study the Little Vehicle according to the Sammatiya school. As a rule, they are indolent and given to indulgence and debauchery. Those who are very earnest as followers of the virtue of the sages live alone in desert places, dwelling far off in the mountains and forests. There night and day they exert themselves in aiming after the acquirement of the holy fruit (*of Arhatship*). There are about thirty Deva temples, in which sectaries of various kinds congregate.

The king is of the Sudra (*Shu-t'o-lo*) caste. He is by nature honest and sincere, and he reverences the law of Buddha.

Upagupta, the great Arhat, sojourned very frequently in this kingdom, explaining the law and convincing and guiding men. The places where he stopped and the traces he left are all commemorated by the building of *sangharamas* or the erection of *stupas*.

Violent people:

By the side of the river Sindh, along the flat marshy lowlands for some thousand *li*, there are several hundreds of thousands of families settled. They are of an unfeeling and hasty temper, and are given to bloodshed only. They give themselves exclusively to tending cattle, and from this derive their livelihood. They have no masters, and, whether men or women, have neither rich nor poor; they shave their heads and wear the *kashaya* robes of Bhikshus, whom they resemble outwardly, whilst they engage themselves in the ordinary affairs of lay life. They hold to their narrow (*little*) views and attack the Great Vehicle.

The old reports state that formerly these people were extremely hasty (*impatient*), and only practiced violence and cruelty. At this time there was an Arhat, who, pitying their perversity, and desiring to convert them, mounted in the air and came amongst them. He exhibited his miraculous powers and displayed his wonderful capabilities. Thus he led the people to believe and accept the doctrine, and gradually he taught them in words; all of them joyfully accepted his teaching and respectfully prayed him to direct them in their religious life. The Arhat perceiving that the hearts of the people had become submissive, delivered to them the three "Refuges" and restrained their cruel tendencies; they entirely gave up "taking life", they shaved their heads, and assumed the soiled robes of a Bhikshu, and obediently walked according to the doctrine of religion. Since then, generations have passed by and the changed times have weakened their virtue, but as for the rest, they retain their old customs. But though they wear the robes of religion, they live without any moral rules, and their sons and grandsons continue to live as worldly people, without any regard to their religious profession.

MU-LO-SAN-P'U-LU (MULASTHANAPURA)

This country (Multan) is about 4000 *li* in circuit; the capital town is some 30 *li* round. It is thickly populated. The establishments are wealthy. This country is in dependence on the kingdom of Cheka (*Tse-kia*). The soil is rich and fertile. The climate is soft and agreeable; the manners of the people are simple and honest; they love learning and honour the virtuous. The greater part sacrifice to the spirits; few believe in the law of Buddha. There

are about ten *sangharamas,* mostly in ruins; there are a few priests, who study indeed, but without any wish to excel. There are eight Deva temples, in which sectaries of various classes dwell. There is a temple dedicated to the sun (famous Sun Temple), very magnificent and profusely decorated. The image of the Sun-deva is cast in yellow gold and ornamented with rare gems. Its divine insight is mysteriously manifested and its spiritual power made plain to all. Women play their music, light their torches, offer their flowers and perfumes to honour it. This custom has been continued from the very first. The kings and high families of the five Indies never fail to make their offerings of gems and precious stones (*to this Deva*). They have founded a house of mercy in which they provide food, and drink, and medicines for the poor and sick, affording succour and sustenance. Men from all countries come here to offer up their prayers; there are always some thousands doing so. On the four sides of the temple are tanks with flowering groves where one can wander about without restraint.

PO-FA-TO (PARVATA)

This country (in the Punjab) is 5000 *li* or so in circuit, its capital is about 20 *li*. It is thickly populated, and depends on the country of Cheka (*Tse-kai*). A great deal of dry-ground rice is here grown. The soil is also fit for beans and wheat. The climate is temperate, the disposition of the people honest and upright. They are naturally quick and hasty; their language is low and common. They are well versed in composition and literature. There are heretics and believers in common. There are some ten *sangharamas* with about 1000 priests; they study both the Great and Little Vehicle. There are four *stupas* built by Asoka-raja. There are also some twenty Deva temples frequented by sectaries of different sorts.

By the side of the chief town is a great *sangharama* with about 100 priests in it; they study the teaching of the Great Vehicle. It was here that Jinaputra, a master of *sastras*, composed the *Yogacaryabhumi Sastrakarika;* here also Bhadraruchi and Gunaprabha, masters of *sastras,* embraced the religious life. This great *sangharama* has been destroyed by fire, and is now waste and ruined.

*

THE LIFE OF HSUAN-TSANG[416]

BOOK II

Yuan Chwang learns from Samghakirti in Kashmir:

He reached the country of Kashmira (modern Hazara). Finally he reached a monastery by the name of Huskara, in which he spent the night. In the course of a few days the Master approached the royal capital, and had reached a guest-house a distance of about one *yojana* from the city. The king and his ministers and the monks in the capital came to the guest-house to welcome him.

Having arrived at the capital the Master stayed in the Jayendra Monastery (built by the king's maternal uncle). On the following day he was invited to the palace to receive offerings, and many virtuous monks, Samghakirti and others were invited to accompany him. After the meal the king requested him to preach the Law and to start a discussion, regarding which the king was highly pleased.

Moreover, as he had come from a distant land to study and there was no written book for him to read, the king ordered twenty copyists to copy the scriptures and commentaries for him. Five men were appointed to be his attendants, and whatever he needed was provided by the king.

The reverend teacher Samghakirti was a man of high virtues who observed the *vinaya* rules very strictly. He was a deep thinker, learned and had great talents. He loved sages and respected scholars, and since the Master was a royal guest, he treated him with special favour. The Master also learned from him whole-heartedly both day and night without feeling tired, and requested him to expound the various *Sastras*.

The teacher, being nearly seventy years old, was very feeble, but he was glad to have met an intelligent pupil and so, with great effort, he exerted himself to teach him. In the mornings he expounded the *Abhidharma-kosa Sastra* and in the afternoons he explained the *Abhidharma-nyayanusara Sastra,* while after the first part of the night, he taught him the *Hetuvidya Sastra* and the *Sabdavidya Sastra*.

Thus the Master stayed in this country for two years to learn the scriptures and commentaries and to visit the holy places.

Learning from a Brahmin disciple of Nagarjuna:

(Yuan Chwang) reached the eastern part of the country of Cheka and arrived at a big city. To the west of the city and by the northern side of the road, was a large mango grove, in which lived a Brahmin 700 years old. He visited him and saw that he looked like a man of thirty with a strong body and clear mentality. He was learned in the *Madhyamika Sastra* and the *Sata Sastra,* as well as in the *Vedas*. He had two attendants, both of whom were over 100 years old. When he saw the Master, he received him with great pleasure, and on hearing that he had been robbed, the old teacher sent one of his attendants to the city to ask the Buddhist followers to prepare food for the Master.

The Master stayed here for one month to study the *Sata Sastra* and the *Sata-Sastra-vaipulya.*

This old man was a disciple of Nagarjuna, and as he had received his learning from his teacher personally, his expositions were clear and easy to understand.

Visits to Buddhist monasteries in north India:

(Yuan Chwang) reached the Tamasavana Monastery, in which lived more than 300 monks who studied the teachings of the Sarvastivadin School. The one thousand Buddhas of the *Bhadra-kalpa* will all come to this place to preach the Law for men and heavenly beings. In the 300th year after the *Nirvana* of the Sakyamuni Buddha, the *Sastra*-master Katyayana had composed the *Abhidharma-jnana-prasthana Sastras* in this monastery.

From here north-east 140 or 150 *li* was the country of Jalandhara. Here, the Master went to the Nagaradhana Monastery, in which lived a virtuous monk named Chandravarma, who was well learned in the *Tripitaka*. He stayed for four months to study the *Abhidharma-prakaranapada-vibhasa Sastra.*

Stupas of Buddha's disciples still surviving:

Eastward 500 *li* from Paryatra was the country of Mathura. Here were *stupas* for the remains of Sariputra and the other holy disciples of the Sakya Tathagata. The stupas for Sariputra and Maudgalyayanaputra and the others were still in existence, and there were also *stupas* for Maitrayaniputra,

Upali, Ananda, Rahula and Manjusri. Each year on the days of performing meritorious deeds, the monks came together to make offerings to the different stupas in accordance with their different studies. The monks who studied *Abhidharma* made offerings to Sariputra, the *Samadhists* to Maudgalyayanaputra, the *Sutraists* to Maitrayaniputra, the *Vinayists* to Upali, the *Bhiksunis* to Ananda, the *Sramaneras* to Rahula, and the *Mahayanists* to the various Bodhisattvas.

At the Ganga; studying *Vibhasa Sastra:*

Still going eastward, after travelling 800 *li*, he reached the source of the Ganges (possibly Hardwar where the Ganga emerges into the plains), which was three or four *li* wide and flowed towards the south-east. The mouth of the river was more than ten *li* wide. The water was sweet, and fine sands came down with the current. It was said in the books of the country that the Ganges was a "river of felicity"; that those who bathed in it would be purified of all sins; that those who washed their mouths with the water would be saved from calamities; that those who were drowned in it would be reborn to heaven to enjoy happiness. Thus ignorant men and women flocked to the bank of the river. But all this was a wrong belief of heretics, without reality. Later the Deva Bodhisattva came and showed them the truth, and they stopped their practices.[417]

In this country was a virtuous monk named Jayagupta, who was well learned in the *Tripitaka*. The Master stayed during the winter and half of the following spring in order to study the *Vibhasa Sastra* of the Sautrantika School.

Crossing the river to the eastern bank, he reached the country of Matipura (identified with Madawar in western Rohilkhand, near Bijnor). The king was of the Sudra caste. Here were ten monasteries with 800 monks, who studied the teachings of the Hinayana Sarvastivadin School.

In Harsha's Kanauj:

Going north-west for 200 *li*, the Master reached Kanyakubja (modern Kanauj)… The Master went to the Bhadra Monastery in which he lived for three months, and studied Buddhadasa's *Vibhasa Sastra* and Suryavarman's *Vibhasa Sastra* under the learned teacher Viryasena.

BOOK III (‘*LIFE*’)[418]

Yuan Chwang on a theological controversy in the Dhamma:

From here travelling towards the east for 500 *li*, the Master reached the country of Visoka (on the northern bank of Gomati river, north of Lucknow) in which were 20 monasteries with 3,000 monks, who studied the teaching of the Hinayana Sammatiya school. In a large monastery on the east side of the road south-east of the capital, the Arhat Devasarman composed the *Vijnana-kayapada Sastra* in which he denied the existence of ego and non-ego, and the Arhat Gopa wrote the *Treatise on the Essential Realities of Buddhism*, affirming the existence of ego and non-ego. Thus serious controversies arose between the followers of these two opposite doctrines. It was also the place where the Dharmapala Bodhisattva defeated 100 Hinayana *Sastra*-masters in seven days. Beside it stood the place where the Tathagata had preached the Law for six years.

Sravasti:

North-east again for another 500 *li*, and the Master reached the country of Sravasti (the old site is said to be in Sahet-Mahet district north west of Patna, but according to others district Khajura in Nepal). It was more than 6,000 *li* in circuit with several hundred monasteries and several thousand monks who studied the teaching of the Sammatiya School. During the Buddha’s time, this was the capital of King Prasenajit. In the city could be seen the ruins of the King’s palace, and not far to the east, the ruins of the Great Preaching Hall which King Prasenajit had built for the Buddha. A stupa was built over the site. There were other stupas at the place of the nunnery of Prajapati (Buddha’s aunt), on the ruins of Sudatta’s residence, and on the spot which marked where Angulimalya had given up his heretical views.

Ruins of Jetavana:

The Jetavana, which was the garden of Anathapindaka, lay five or six *li* to the south of the city. Formerly a monastery had been on the site but it is now in ruins. On the left and right sides of the eastern gate were two stone

pillars, 70 feet high, erected by King Asoka. All the buildings were dilapidated, with the exception of one brick house, which contained a golden image of the Buddha. When the Buddha had ascended to the heaven to preach the Law for his mother, King Prasenajit desired to see him, and on hearing that King Udayana had carved an image of the Buddha with sandalwood, he made also this image.

Conspiracy against the Buddha:

In a place not far behind the monastery some heretical *brahmacarins* had slain a harlot in order to bring reproach on the Buddha. One hundred paces to the east of the monastery a deep pit indicated the place where Devadatta, trying to kill the Buddha by poison, fell alive into hell. To the south another pit marked where *Bhikshu* Kokalika, having slandered the Buddha, fell alive into hell. 800 paces to the south, still another pit marked where Chandamana, a Brahmin woman, having slandered the Buddha, fell alive into hell. All three pits were so deep that one could not see the bottom.

The sala grove of Buddha's pari-nirvana:

Three or four *li* to the north-west of the city, he crossed the Ajitavati River, and not far along, by the side of the river, he reached the Sala Grove. The *sala* trees were like the oak with a greenish bark and white leaves which were very smooth. There were four pairs of *sala* trees of the same height at the place where the Tathagata entered Nirvana. In a large brick temple was an image of the Tathagata in the posture of entering Nirvana, with its head lying towards the north. Beside the temple was a large stupa, more than 200 feet high, built by king Asoka. He also erected a stone pillar on which was inscribed the event of the Buddha's *Nirvana*, but no date was recorded on it. It was said in tradition that the Buddha lived for eighty years and entered *Nirvana* on the 15th day of the second half of the month *Vaisakha*, corresponding with the 15th day of the 2nd month of our calendar, but the Sarvastivadins held that the Buddha entered *Nirvana* on the 8th day of the second half of the month *Karttika*, corresponding with the 8th day of the 9th month of our calendar. It had been 1,200 years since the Buddha's *Nirvana*, while some people said that it had been 1,500 years, and still others said that it had been over 900 but less than 1,000 years.

Collecting manuscripts:

In the south of Vaisali the Master crossed the Ganges and after having travelled for more than 100 *li*, he reached the city of Svetapura (a monastery) where he obtained a copy of the *Bodhisattva pitaka.*

At Nalanda; meeting with the Venerable Silabhadra:

On the tenth day the people of the Nalanda monastery sent four monks of great virtue to welcome the Master, and he went with them.

When he had reached the monastery, all the monks assembled to meet him, and a special seat was prepared for him by the side of the abbot. When the monks had seated themselves, the director of duties, beating a bell, announced that the Master was to live in the monastery and that he might use all the utensils and implements of the monastery with the other monks. Then a number of twenty monks, who were neither too old nor too young, well learned in the *Tripitaka* and good in manners, were ordered to accompany the Master to see the Right Dharma Keeper, *I.E.*, the Venerable Silabhadra. Out of respect the monks did not call him by his name but mentioned him as the Right Dharma Keeper. The Master went with the monks to see him, and having seen him, worshipped him as a teacher with utmost respect.

After they had seated themselves, he asked the Master: "Where do you come from?"

In reply, the Master said, "I came from China to learn the *Yogacarya-bhumi Sastra* from the teacher."

On hearing this, the Right, Dharma Keeper shed tears and called for his disciple Buddhabhadra, who was his nephew, more than seventy years old, thoroughly learned in the *Tripitaka* and eloquent in discussion. He said to him: "You may tell the monks how I suffered from illness three years ago."

On hearing this, Buddhabhadra dried his tears and related the event, saying: "The teacher used to suffer from rheumatism and each time when it relapsed he fell into convulsions and felt pain as sharp as if he were burned by fire or pricked by a knife. This illness troubled him for a period of more than twenty years; he sometimes recovered, sometimes relapsed. Three years ago the pain was aggravated to such an extent that the teacher became tired of his body and wished to end his life by starvation. One night he saw

in a dream three heavenly beings, of whom one was golden yellow in colour, one was green and the other one silver white in colour. They had good features and were well-dressed, and they came and asked the teacher: 'Do you intend to give up your body? It is said in the scriptures that this body is an object of suffering, but it is not taught to give up one's body. You were once a king in one of your past lives and caused much pain to the people, and thus you are suffering your retribution now. You should meditate on your past evil deeds with a sincere mind of repentance. Be patient with the pain and preach the scripture and commentaries diligently, and then it will disappear. By giving up your body, you can never end your pains.'

"Upon hearing this, the teacher respectfully worshipped them, and the golden figure, pointing at the green person, said to the teacher: 'Do you recognise him? He is the Avalokitesvara Bodhisattva.' He then pointed at the silvery person and said: 'This is the Maitreya Bodhisattva.' The teacher then worshipped the Maitreya Bodhisattva and asked: 'I have always wished to be reborn in your palace, but I do not know whether I shall be able to realize my wish.' In reply, the Bodhisattva said: 'If you widely spread the Right Law, you will be able to be reborn there.' Then the golden figure said: 'I am the Manjusri Bodhisattva. As we saw that you intended to abandon your body without any advantageous purpose, we have come to give you some advice. You should act according to my words to propagate the Right Law and preach the *Yogacarya-bhumi Sastra* and the other books to those people who have not yet heard about them. You will then gradually recover from your illness and you need not worry about it. A Chinese monk who wishes to learn the great Law will come to study from you. You may wait to teach him.' Upon hearing this Right Dharma Keeper worshipped them and said: 'I will act according to your instructions.'

When he had said so, the Bodhisattvas disappeared. Since then, the teacher is relieved of his painful illness."

The Master felt both excited and happy, and he again worshipped the teacher, saying: "since such is the case as has been said, I will study with utmost effort. May you be kind enough to accept me as a pupil."

The Right Dharma Keeper asked again: "How many years did you spend on the way?"

"Three years," replied the Master.

Since the time coincided with his dream, the teacher said many pleasant things to please the Master, in order to show his affection as a teacher to a pupil.

After the interview the Master took his leave. He was lodged on the fourth storey of Buddhabadra's house in the courtyard of King Baladitya. After having been entertained for seven days, he was lodged in a guest-house, to the north of the house of the Dharmapala Bodhisattva, and his daily requisites were increased.

He was attended by one servant and one Brahman and was exempted from ordinary monastic duties, and when he went out he had an elephant to ride on. Of a total number of 10,000 host and guest monks of the Nalanda Monastery, only ten persons, including the Master, enjoyed such privileges. Wherever he travelled the Master was always treated with respect like this.

Nalanda means "insatiable of giving". It was said in tradition that there was a pond in the mango grove to the south of the monastery. In the pond was a dragon by the name of Nalanda, and as the monastery was built beside it, it was called by this name. It was also said that when the Tathagata was a king during the time when he pracitsed the ways of a Bodhisattva, he founded his capital at this place, and as he often gave alms to the poor and the lonely with a mind of compassion, the people named this place as "insatiable of giving" in gratitude for his favours. This place was originally the garden of the elder Amra, and five hundred merchants bought it over with ten million golden coins to offer to the Buddha, who preached the Law at this place for three months and many of the merchants realised sainthood. After the Buddha's *Nirvana* a former king of this country, Sakraditya, built this monastery in memory of the Buddha. After the death of the king, his son, King Buddhagupta, succeeded him and built another monastery to the south. His son, King Tathagata, also built a monastery at the east. His son, King Baladitya, again built another monastery to the north-east, and when he saw that a holy monk had come from China and stayed in his monastery, he was so pleased that he abdicated and became a monk himself. His son, Vajra, succeeded him and built another monastery at the north. Afterwards a king of Central India built a monastery beside it. Thus six kings built as many monasteries one after the other, and an enclosure was made with bricks to make all the buildings into one monastery with one entrance for them all.

The Hamsa-stupa:

Several *li* towards the east, a *stupa* marked the place where the King Bimbisara and hundreds and thousands of his people welcomed the Buddha when he was coming to Rajagrha after he had attained enlightenment. Thirty *li* further was Indrasailaguha. In front of the monastery on the east peak of the mountain, was a stupa called the "*Hamsa-stupa*." Formerly the monks of this monastery ate the three kinds of pure meat according to the "gradual teaching" of the Hinayana School. Once this kind of food could not be purchased, and the monk in charge did not know what to do. When he saw a flock of wild geese flying in the sky, he said jokingly: "Today the monks are short of food, and the Mahasattva should know that this is the proper time to make a sacrifice."

When he had said so, the goose that led the others in the flight, returned and dropped from the high clouds to the ground. On seeing this the monk was frightened and felt ashamed. He informed the monks, and those who heard of it shed tears of regret. They said, "This is a bodhisattva, and who are we to dare to eat his flesh?

The Tathagata has taught the 'gradual teaching' for us to advance gradually, but we grasped what he has taught at the beginning as his final teaching. It is owing to our stupidity without trying to correct our error that caused this disaster. From now onwards we should act according to the Mahayana teachings and never eat the three kinds of pure meat again."

Thereupon they built a *stupa* to bury the dead goose in memory of its spirit of self-sacrifice, and this was the *stupa* that they had built for that purpose.

Studying the Sastras for five years at Nalanda:

In the Monastery the Master attended the lectures on the *Yogacarya-bhumi Sastra* for three times, the *Abhidharma-nyayanusara*, the *Prakaranaryavaca Sastra* and the *Abhidharma-samuccaya-vyakhya* each for one time, the *Hetuvidya Sastra*, the *Sabdavidya Sastra* and the *Samuccaya-pramana Sastra* each for two times, the *Madhyamika Sastra* and the *Sata Sastra* each for three times. As regards the *Abhidharma-kosa Sastra*, the *Vibhasa Sastra*, the six *Abhidharma-pada Sastras*, etc. which he

had already learned in Kasmira and the other countries, he merely clarified the doubtful points that he had found in them.

He also studied the Brahmanic book, and this Indian Brahmanic book was known as the *Mnemonic Treatise*, the origin and author of which were unknown. It was first taught by Brahma to the *devas* at the beginning of each *kalpa*, and as it was taught by Brahma, it was called the Brahmanic Book. It is a voluminous work, having one million stanzas, which was translated in old times as the *Pi-chieb-lo Sastra,* but the spelling was incorrect. Its proper name is *Vyakarana*, meaning a mnemonic treatise on the science of words. It is so called because it deals extensively with the words that convey all the *dharmas*.

Formerly at the beginning of the Constructive *Kalpa*, Brahma first taught it in one million stanzas, and later at the beginning of the Duration *Kalpa*, Indra abridged it to one hundred thousand stanzas. Still later the *Rsi* Panini of Salatura City of Gandhara in North India, again reduced it to eight thousand stanzas, and this was the text which was prevalent in India. Recently a Brahman of South India again shortened it to two thousand and five hundred stanzas for the king of south India, but this text was prevalent only in the frontier countries and the learned scholars of India never studied it.

The Master thoroughly understood this language and was able to discuss the holy scriptures with the people of India. Thus he studied the scriptures of the various schools and the Brahmanic books for a period of five years (at Nalanda).

The Kapota (Pigeon) Monastery:

From here he went again to the country of Hiranyaparvata (modern Monghyr). On his way he reached the Kapota Monastery.

An image of the Avalokitesvara Bodhisattva carved from sandalwood stood in the central temple. It was particularly miraculous, and always before it were several tens of people fasting for seven or even fourteen days, praying for the fulfilment of their wishes. Those who were most devout might behold the Bodhisattva coming out of the sandalwood image in a stately manner with a brilliant light, to console them and grant their

wishes. Many people saw the Bodhisattva in such a way and thus more and more devotees came to worship him.

The man who attended the image feared that the visitors might soil it, and so he enclosed it with a wooden railing on the four sides at about seven steps from it. The people who came to worship the image did so outside the railings and could not go near it. Offerings to it of incenses and flowers were scattered at a distance. When the flowers rested on the hand or hung upon the arm of the image, it was regarded as auspicious and that one's wishes would be fulfilled.

Wishing to pray before the image, the Master brought different flowers and made some garlands with them. On approaching the image, he worshipped and praised it with a sincere mind. Then he knelt and made three wishes, saying: "First, may the flowers rest on your hand if I may safely return to my own country after I have completed my studies here; second, may the flowers hang upon your arms if I may be reborn to the Tusita Heaven to serve the Maitreya Bodhisattva by the merit and wisdom which I have cultivated; third, as it is taught in the holy teachings that a part of the sentient beings do not possess the Buddha-nature, I am now in doubt, not knowing whether I have it or not – may the flowers hang upon your neck if I have the Buddha-nature and may become a Buddha in the future."

Having said so, he scattered the flowers at a distance and they all stayed at the places as he had wished. Having fulfilled his wishes, he was greatly delighted, and on seeing this event the people who worshipped together with him and the keeper of the temple snapped their fingers and stamped their feet on the ground, saying that it was an unprecedented affair, and they suggested that the Master on account of this event should come to save them first when he should become a Buddha in the future.

Studying the holy books:

From the monastery the Master continued to the country of Hiranyaparvata.

Two great teachers, Tathagatagupta and Ksantisimha, dwelt here both of whom were well versed in the teachings of the Sarvastivadin School. The master stayed for one year to study from them the *Vibhasa Sastra* and the *Abhidharma-nyayanusara* and some other books.

BOOK IV (‘*LIFE*’)

En route to Sri Lanka (Ceylon, Simhala):

At that time the Master heard that there was the country of Simhala situated in the sea, and that there were people who were learned in the *Tripitaka* of the Sthavira School and understood the *Yogacarya-bhumi Sastra*. One had to sail over the sea for 700 *yojanas* before one could reach that country. Before he started the voyage, he met a monk of South India, who advised him, saying: “If you want to go to the Country of Lions, you need not take the sea route, as there are always tempests and the trouble of *Yaksas* in the sea. You may go from the south-east corner of South India and reach that country after a voyage of only three days. You will have to climb over mountains and go across rivers, but it will be much safer for you, and moreover you may go to visit the holy places in the country of Uda and in the other countries.”

Thus the Master proceeded towards the south-west to the country of Uda. In its 100 monasteries 10,000 monks studied the teachings of Mahayana Buddhism. There were also heretical *deva*-temples; and the Buddhists and non-Buddhists lived together. Ten *stupas*, all built by King Asoka, often had miraculous manifestations.

From Kalinga the Master proceeded north-west for 1,800 *li* to the country of South Kosala (ancient Vidarbha or Berar). The king was a Ksattriya by birth, and he respected Buddhism and loved the arts and learning. The country had 100 monasteries with 10,000 monks. Heretics, who worshipped in *deva*-temples, were also numerous. Not far to the south of the city was an old monastery, beside it a *stupa*, built by King Asoka. Formerly the Tathagata subdued the heretics at this place with his great supernatural powers, and afterwards the Nagarjuna Bodhisattva lived in this monastery. At that time the king of this country, named Satavahana, respected Nagarjuna and provided him with rich offerings.

The Deva Bodhisattva came from the country of Simhala, wishing to have a discussion with Nagarjuna. He requested to be admitted. The door-keeper reported to Nagarjuna, who, having heard the fame of the visitor, filled a bowl with water and asked his disciple to show it to him. On seeing the water Deva silently dropped a needle into it, and the disciple took it back to

his teacher. Nagarjuna was greatly pleased by this and said with delight: "The bowl filled with water signifies my learning, and his dropping of the needle means that he could fathom the depth of my knowledge. With such a man I could discuss the mysterious teachings and to whom I may hand down the lamp of learning."

Thus he gave the order to admit him, and when they had seated themselves, they talked and discussed to their mutual delight and were as happy as a fish put in water. Nagarjuna said: "I am old and feeble, and it will depend on you to make the Sun of Wisdom shine."

Deva stood up and saluted Nagarjuna at his feet, saying: "Although I am stupid, I will be glad to receive your kind instructions."

In this country a certain Brahmin was well versed in *Hetuvidya*, and the Master stayed there for more than a month to study the *Samuccaya-pramana Sastra*.

From this place the Master travelled south-east through a big forest 900 *li* to the country of Andhra (modern Telingana). Beside the city stood a large monastery, a magnificent construction of a beautiful and stately appearance. In front of it stood a stone *stupa*, several hundred feet high, built by the Arhat Acara. At a distance of 20 *li* to the south west for the arhat's monastery, on an isolated hill, was a stone *stupa*, built at the place where the Dinnaga Bodhisattva composed the *Hetuvidya Sastra.*

Going south 1,000 *li* the Master reached the country of Dhanakataka (modern Bezwada on the Kistna river).

In this country the master met two monks. One was named Subhuti and the other one, Surya. They were well versed in the *Tripitaka* of the Mahasamghika School. He stayed for several months to study the *Mulabhidharma Sastra* and some other books of the Mahasamghika school from them, while they also studied the various *Mahayana Sastras* from the Master. Then they travelled together to visit and worship the holy places.

Birthplace of Dharmapala Bodhisattva:

From Culya the Master went through a big forest towards the south for 1,500 or 1,600 *li* to the country of Dravida (modern Nagapatam). The capital of this country was Kancipura, which was the birthplace of the Dharmapala Bodhisattva. This bodhisattva was the son of a minister of this

country and was very intelligent since his youth. When he had come to age, the king admired his talents and wanted to marry the princess to him. But as the Bodhisattva had practiced celibacy for a long time, he had no desire to be attached by marriage, and he was greatly worried on the night of the wedding. Wishing to escape from his trouble he prayed before an image of the Buddha. In response to his earnest prayers, a great king of gods bore him out and sent him to the shrine hall of a monastery on a hill at a distance of several hundred *li* from the capital. When the monks came and saw him, they took him to be a thief. The Bodhisattva told them of his dilemma, and those who heard it were amazed and respected him for his sublime ambition. Thus he renounced his home and became a monk. Afterwards he devoted himself to the study of the Right Law and thoroughly mastered all the scriptures of the different categories and wrote many books. He composed the *Sabdavidya-samyukta Sastra* in 25,000 stanzas and also wrote several tens of books in exposition of the *Sata-Sastra-vaipulya*, the *Vijnaptimatra-siddhi Sastra*, the *Hetuvidya Sastra* and some other works. All his books were widely read, and there was a special biography of him detailing his rich virtues and high talents.

Simhala monks arrive in Kancipura:

The city of Kancipura was a seaport of South India, and starting from here one could reach the country of Simhala after a voyage of three days. Before the Master started his voyage, the king of that country had died and a severe famine occurred in that land. More than 300 learned monks, headed by *Bodhimedhesvara* and *Abhayadanstra*, came to India and arrived at Kancipura. Having met the monks, the Master asked them: “As I know that the learned monks of your country are well versed in the *Tripitaka* of the Sthavira School and in the *Yogacarvya-bhumi Sastra,* I am prepared to go there. How is it that you teachers have come here?”

In reply they said: “As the king of our country has died and the people are suffering from famine, we have nobody to depend upon. We have heard that Jambudvipa is a rich and happy country in which one could live in safety, and moreover it is the land in which the Buddha was born and there are many holy places. Therefore we have come here. As regards those knowing

the *Dharma*, none surpassed us in our country, and if your reverence has any doubtful questions, you may inquire of us as you please."

The Master then quoted some important passages of the *Yogacarya-bhumi Sastra* for elucidation, but they could not give a better explanation than Silabhadra.

Sandal and camphor trees:

The Master had heard that at a distance of more than 3,000 *li* was the country of Malakuta (including modern Tanjore and Madura on the east, and Coimbatore, Cochin and Travancore on the west). It was situated by the seaside and was rich in unusual jewels. To the east of the capital was a *stupa*, built by King Asoka. Formerly the Tathagata preached the Law and exhibited great supernatural powers to convert countless people at this place. In the south by the seaside was the Malaya Mountain which had lofty peaks and deep valleys. On the mountain were many white *candana* and *candaneva* trees. The latter resembled the poplar and its wood was cool by nature, and thus serpents used to twine around these trees till the winter when they went away to hibernate. By this way the *candaneva* trees were distinguished from the *candana* trees. There were also fragrant *karpura* trees, which looked like the pine, but had a different kind of leaf and their flowers and fruits also were different. When the wood of these trees was sappy, it had no scent, but when it was dried it produced a kind of fragrant substance resembling mica with a snow-white colour. This is what we call camphor.

Crown of prince Sarvasiddhartha:

From Dravida the Master travelled back towards the north-west with more than 70 monks from the country of Simhala to visit and worship the holy places. After more than 2,000 *li* he reached the country of Konkanapura (Annagundhi on the northern bank of the Tungabhadra river was its capital). It had 100 monasteries with more than 10,000 monks who studied the teachings of both the Mahayana and Hinayana Schools. Numerous heretics worshipped in *deva*-temples. Beside the king's palace city was a large monastery in which lived 300 monks, all well learned scholars. In the monastery the precious crown of prince Sarvasiddhartha, which was less

than two feet high, was kept in a precious casket. On festival days it was displayed on a high terrace, and those who worshipped it with a sincere mind might cause it to emit a wonderful light. The monastery beside the palace city had a shrine hall, in which an image of the Maitreya Bodhisattva carved in sandalwood, more than ten feet high, also often emitted a bright light. It was said that this image was made by the Arhat Sronakotivimsa.

Tala trees:

To the north of the city was a wood of *tala*-trees, 30 *li* in circuit. The leaves of these trees were oblong with a bright colour, and they were the most valuable material for writing in the various countries.

In Maharastra:

Proceeding towards the north-west through a big forest infested with wild beasts, and after travelling for 2,400 or 2,500 *li*, the Master reached the country of Maharastra (Nasik capital of this ancient land). The people of this country preferred death to disloyalty, and the king, being a Ksattriya by birth, was warlike and loved military arts. Thus the troops of this country were well disciplined under strict military rules. When his generals went to fight with his enemies and were defeated in battle, they were not inflicted with any punishment, but were simply ordered to wear women's dress in order to humiliate them. Many of them, filled with shame, committed suicide. The king kept a number of several thousand brave men and several hundred wild elephants. As the time of battle approached he gave them much wine to drink, and they were sent to the front when they were almost drunk. Thus they would dash forward and break up the enemy's line. Depending on his military strength, the king was arrogant and regarded with contempt his enemies in the neighbouring counties. King Siladitya, who was sure of his own strategic talents and military strength, came to attack this country personally, but failed to subjugate it.

More than 100 Monasteries existed with 5,000 monks who studied the teachings of both the Mahayana and Hinayana Schools. In the country were also *deva*-temples of the heretics who smeared dust on their bodies. The five *stupas* inside and outside the capital city were all several hundred feet

high. These were places where the four past Buddhas had visited, and the *stupas* were built by King Asoka.

About Buddha in Sindh:

Again north-east for 300 *li*, to the country of Avanda (Middle Sindh). In the big forest to the north-east of the capital, were the old foundations of a monastery, in which the Buddha had formerly permitted the monks to wear leather sandals. Beside a *stupa* built by King Asoka was a temple, in which stood an image of the Buddha made of blue stone, which often issued a bright light. Further to the south in the big forest at a distance of more than 800 paces was another *stupa* which was built by King Asoka. This was the place where the Tathagata had formerly spent a night, and as it was cold he covered himself with three robes at the same time. Thus in the following morning, he permitted the monks to wear double robes.

From here the Master went east for more than 700 *li* to the country of Sindh. This land produced gold, silver, bronze, oxen, sheep and camels, as well as red, white and black salt, which the people of other places used as medicine.

Multan's Sun temple:

Continuing east 900 *li*, he crossed the river to the eastern bank and reached the country of Morasampuru (modern Multan). The people worshipped the *devas* in a magnificent temple, in which there was an image of Surya which was cast in gold and adorned with the various kinds of gems. The people of the different countries often came to pray before this image. All around the temple were flowers, trees, ponds and terraces connected with one another, and those who visited the place would feel delighted with its scenery.

Studying in Parvata:

Going north-east for 700 *li*, the Master reached the country of Parvata. In a large monastery lived more than 100 monks, who all studied Mahayana teachings. This was the place where the *Sastra*-master Jinaputra composed the *Commentary* on the *Yogacarya-bhumi Sastra,* and it was also the place where the *Sastra*-masters Bhadraruci and Gunaprabha renounced their

home to become monks. As there were two or three well-learned teachers under whom one might study, the Master stayed here for two years to learn the *Mulabhidharma* of the Sammatiya School, the *Sadharma-Samparigraha Sastra* and the *Prasiksa-satya Sastra*.

Return to Nalanda and further studies with Prasenajit:

He returned from Parvata to the Nalanda monastery in Magadha. After having paid homage to the Right Law Keeper, he heard that at a distance of three *yojanas* to the west of the monastery was the Tiladaka Monastery, in which lived a learned monk named Prajnabhadra, who was a native of Balapati and had become a monk of the Sarvastivadin School. He was well versed in the *Tripitaka* of his own school, as well as in *Sabdavidya* and *Hetuvidya*.

After staying two months to solve some doubtful points that he had in his mind, he again went to the Staff-forest Hill to visit the hermit *Sastra*-master Prasenajit. Prasenajit was a native of Suratha and a Ksatriya by birth. He had loved learning since his youth, and studied at first *Hetuvidya* from the *Sastra*-master Bhadraruci and learned *Sabdavidya* and the various *Sastras* of both Mahayana and Hinayana Schools under the Sthitamati Bodhisattva. He also learned the *Yogacarya-bhumi Sastra* from the venerable Silabhadra, and he thoroughly mastered all the non-Buddhist books, such as the Four *Vedas*, astronomy, geography, medicine and mathematics, of which he had a deep understanding in their full details. Since he was well-learned in both Buddhist and non-Buddhists knowledges and was respected by the people for his virtue, King Purnavarman of Magadha, who respected sages and scholars, was quite pleased to hear his name and sent an envoy to invite him to be the royal teacher with a conferment of twenty villages as his fief. But the *Sastra*-master declined the offer. King Siladitya then invited him to be his teacher with a conferment of eighty large villages in the country of Uda as his fief, but the *Sastra*-master also declined this offer. The king insisted on his invitation again and again, but Prasenajit refused with determination to accept it. He said to the king: “I have heard that if one accepted the gifts of others, one would have to share their responsibilities. Now as I am urgently engaged in my work for the liberation of rebirth, how can I have time to attend to the king’s affairs?”

Saying so, he saluted the king and went away, and so the king could detain him no more. Since then he had always lived on the Staff-forest Hill teaching pupils and expounding Buddhist scriptures.

The Master stayed with him for two years to learn the *Explanatory Treatise on the Vijnaptimatrasiddhi Sastra,* the *Treatise on Doctrinal Theories,* the *Abhaya-siddhi Sastra,* the *Treatise on Non-attachment of Nirvana,* the *Treatise on the Twelve Nidanas* and the *Mahayana-Sutralamkara Sastra*, and he also solved some doubtful points in the *Yogacarya-bhumi Sastra* and the *Hetuvidya Sastra*.

Prophecy of the fall of Nalanda:

When the Master had completed his studies, he dreamed one night that the buildings of the Nalanda Monastery were deserted and in a dirty condition with some buffaloes tied in the houses. He entered the monastery through the western gate of King Baladitya's Court and saw a golden figure on the fourth storey, who had a stately appearance and whose light filled the room. With a happy mind he desired to ascend to the storey, and as he could not find the way, he requested the golden figure to lead him. But the figure said: "I am the Manjusri Bodhisattva. Owing to your karmic force, you cannot come up here." Then he pointed at the outside of the monastery and said: "Look there!"

The Master looked and saw that a great fire consumed all the villages and towns outside the monastery. The golden figure said to him: "You may return home at an early time, as after ten years King Siladitya of this country will die and India will be in a state of famine and disorder, and the evil people may hurt you. You ought to know this."

Having said so the golden figure disappeared.

When the Master awoke, he thought the dream very strange and told it to Prasenajit, who said to him: "It may be true, as the three Realms are indeed a place of insecurity. Since you have been told so, you may make your own decision."

Later at the end of the period of Yung Hui (AD 650-655), King Siladitya actually died and India fell into a state of famine and disorder, just as had been foretold. Wang Hsuan-tse, the imperial envoy to India, witnessed all these events…

The Master expounds the Law:

The *Sastra*-master Silabhadra asked the Master to expound the *Mahayana-samgraha Sastra* and the *Explanatory Treatise on the Vijnaptimatrasiddhi Sastra* for the monks. The learned teacher, Simhaprabha, had previously expounded the *Madhyamika Sastra* and the *Sata Sastra* for the four groups of followers,[419] in refutation of the teachings of the Yoga School. Being well versed in the *Madhyamika Sastra* and the *Sata Sastra,* as well as in the *Yogacarya-bhumi Sastra*, the Master considered that the saints established their teachings in accordance with their particular views without contradiction. If one did not thoroughly understand the teachings and said that they were contradictory, it was but the fault of the student and had nothing to do with the Law. Having pity for his narrow-mindedness, the Master went to interrogate him several times, but he was unable to give adequate replies. Thus his pupils gradually dispersed and came to study under the Master.

The Master told him that the teachings of the *Madhyamika Sastra* and the *Sata Sastra* only refuted the theory which regarded the seeming to be real, but did not mention about the nature of dependant arising and the nature of absolute reality. Simhapraha could not comprehend this, but asserted that the theory concerning the nature of absolute reality as advocated by the *Yogacarya* School should also be discarded, as it was taught in the *Sastras* that everything was void without a true nature. Thus he often expressed his opinion in his sayings. In order to harmonise the teachings of the two schools without any contradiction, the Master composed the *Treatise on the Harmony of Teachings* in 3,000 stanzas. When it was completed, he presented it to Silabhadra and all the monks, who praised it as a good work and declared that it should be studied by all.

Feeling ashamed of himself, Simhaprabha went away to the Bodhi monastery and asked Candrasimha of East India, who was his schoolmate, to come and raise a debate with the Master in order to erase his humiliation. But when that man came, he felt so awed in the presence of the Master that he could not utter a word. Thus the Master's reputation rose still higher.

King Siladitya accepts a challenge:

Before Simhaprabha went away, King Siladitya had constructed a bronze temple over a hundred feet high beside the Nalanda Monastery, and this bronze temple was well-known in the various countries. Afterwards the king went to conquer Konyodha and arrived in the country of Uda on his way. The monks of this country all studied Hinayana teachings and did not believe in Mahayana Buddhism, which, they said, was the teaching of the Sunyapuspa heretics and was not taught by the Buddha. On seeing the king they said to him with derision: "We have heard that Your Majesty has constructed a bronze temple beside the Nalanda Monastery, which is indeed a grand and magnificent work. But why did Your Majesty choose to build it there and not beside some heretical temple of the Kapalikas?"

The king said: "what do you mean by saying so?"

They replied: "because the monks of the Nalanda Monastery are Sunyapuspa heretics and are just the same as the Kapalikas."

Formerly an old Brahmana named Prajnagupta, who was the Master conducting the coronation ceremony of the king of South India and was well-learned in the teachings of the Sammatiya School, composed a treatise in 700 stanzas for the refutation of Mahayana Buddhism. The Hinayana teachers were all delighted with the work, and they showed it to the king, saying: "This is the teaching of our school. Could there be any Mahayanist who could refute a single word of it?"

The king said: "That will not be difficult."

He wrote a letter on that day and dispatched a messenger to send it to the venerable Silabhadra, the Keeper of the Right Law, of the Nalanda Monastery.

"…I am writing this to inform you of the above and wish you would send four virtuous monks who are well versed in the teachings of both Mahayana and Hinayana Schools, as well as in non-Buddhist knowledge, to come to the country of Uda where I am staying."

On receiving this letter, the Keeper of the Right Law assembled the monks to select the competent persons, and he appointed Sagarajnana, Prajnaprabha, Simhaprabha and the Master as the four persons to comply with the king's order. Sagarajnana and the other two monks were quite worried, but the Master said to them: "I have learned the whole *Tripitaka* of the various sects of Hinayana Buddhism while I was in my own country and when I was staying in Kasmira, and thus I thoroughly understand their

teachings. It is impossible for them to refute Mahayana teachings with their own theories: although I am not deeply learned with but little wisdom, I shall be able to deal with them, and therefore you need not worry about it. If I am defeated in the debate, it will be the failure of a Chinese monk and will have nothing to do with you."

On hearing this, the other monks were pleased.

But afterwards King Siladitya sent another letter to them, saying that the virtuous monks whom he had invited previously, need not go immediately, but should wait for further notifications before they started. …

At the time when the Master intended to visit Uda, he obtained a copy of the Hinayana treatise composed in 700 stanzas in refutation of Mahayana teachings. He read through the composition and found several doubtful points in it. Thus he asked the Brahmana (his slave after defeat in an oral contest) whom he had defeated in the debate: "Have you studied this treatise before?"

He replied: "I have studied it five times."

The Master desired him to explain it for him, but he said: "Being a slave of yours, how can I explain anything to your reverence?"

The Master said: "This is the theory of some other school, which I have not heard before. You may explain it for me without scruple."

In the night the Master sent away all the people and asked the Brahmana to expound the treatise once, and he grasped the essential principles of the treatise. Having found out all the fallacious points in the work, he composed the *Refutation of Evil Views* in 1,600 stanzas to refute them all with the teachings of Mahayana Buddhism. He presented his work to the venerable Silabhadra and showed it to his students, who all praised him, saying: "With his profound wisdom, he has no opponent whom he cannot vanquish!"

This treatise is preserved somewhere else.

Then he said to the Brahmana: "You have been sufficiently humiliated to be my slave after you were defeated in the debate. Now I give you freedom and let you go wherever you like."

The Brahmana was highly pleased, and taking leave of the Master, he went to the country of Kamarupa (present western Assam) in East India, where he talked with King Kumara about the virtue and righteousness of

the Master. The king was delighted to hear this and immediately sent an envoy to invite the Master to go to his country.

BOOK V (‘*LIFE*’)

Prophecy of a Jaina saint:

Before the arrival of the envoy of King Kumara, one day a certain naked Nirgrantha, named Vajra, came into the chamber of the Master. Having heard that the Nirgranthas were good at divining, the Master asked him to take a seat and requested him to solve some of his doubts, saying: “Being a Chinese monk I have come here to study for so many years. Now I intend to return home, but I do not know whether I shall be able to reach my native country. Moreover, which would be better for me – staying in this country or going home? And I wish to know the length of my life. Will you please divine these matters for me?”

The Nirgrantha then asked for a piece of white stone and used it to draw lines on the ground for divination. He said to the Master: “It will be good for you to stay, as the religious people and laymen of the five Indias will all treat you with respect. If you return home, you will be able to reach your home safely and will also be treated with respect, but it will not be as good as staying here. As regards the length of your life, you will live for ten more years from now on, but if you perform meritorious deeds to prolong your life, then it is beyond my knowledge.”

The Master then stated that, as he was desirous of returning, he did not know whether he was able to carry home the great amount of scriptures and images of the Buddha.

The Nirgrantha replied: “Don’t worry about that. King Siladitya and King Kumara will appoint men to send you back and you can reach home without difficulty.”

The Master said: “As I have never seen these two kings, how can they grant me such favours?”

The Nirgratha said: “King Kumara has already sent an envoy to come to invite you and he will be here in two or three days. After having seen King Kumara, you will also see King Siladitya.”

Yuan Chwang prepares to return home:

The Master then made arrangements about his scriptures and images of the Buddha, preparing for his homeward journey. Having heard of this, the monks all came to advise him to stay, saying: "India is the country where the Buddha was born. Although the Great Saint has passed away, the holy traces left by him are still in existence, and it will be quite delightful for you to go round and pay homage to them. Why do you want to go away after having come to this country? Moreover, China is but a border-land where good people are not respected and the *Dharma* is despised. Therefore the Buddhas are never born in that country, and as the people are narrow-minded with deep impurities, the saints and holy men will never go there. The climate is cold there and the road is dangerous. Why do you think of going back?"

The Master replied: "When the Buddha founded his teaching he meant them to be propagated. How can I forget about those who have not heard the Law, while I have been benefitted by it? Moreover China is a highly civilised country where the people have a high standard of behaviour, the emperor is sagacious. And his ministers are loyal, and the father is kind towards his son while the son is filial towards his father. Kindness and righteousness are esteemed and the aged and the wise, respected. They are moreover able to discern what is subtle and profound, and their wisdom is corresponding with that of the gods. They act in accordance with the law of nature, and the seven planets could not overshadow their cultural brilliance. They have invented the device for the division of time and created the musical instruments of six notes. They are able to enslave the birds and beasts, inspire the ghosts and spirits and employ the principles of negativity and positivity (*yin* and *yang*) for the benefit of all creatures. Since the Buddha's bequeathed Law was introduced to the East, they have believed in Mahayana Buddhism. They practice meditation as tranquilly as a pond of clear water, and they observe the *Vinaya* rules in a manner as lovely as the fragrance of flowers. They cherish the mind to practice the deeds of a Bodhisattva with the wish to attain the Ten Stages, (of development to the Bodhisattva stage) and they cultivate spiritual perfection with joined palms in order to realize the Three Bodies of a Buddha (the *Dharmakaya* or body of *Dharma* which is the reality of everything; the *Sambhogakaya* or body of

reward; and the *Nirmanakaya* or body of transformation). Great saints have always appeared in that land to edify the people, who have heard their wonderful teachings with their own ears and witnessed their golden features with their own eyes. They are just like a carriage drawn by two horses – how far it could travel you can never know. How can you despise that land simply because the Buddha was not born there?"

Seeing that the Master would not accept their advice, the monks asked him to go with them to see the Venerable Silabhadra to whom they expressed their wishes. Silabhadra inquired to the Master: "what is your decision?"

The Master said in reply: "As this is the country where the Buddha was born, I am certainly not unwilling to stay here. But I came here with the intention to acquire the great Law for the benefit of all living beings. Since my arrival I have been privileged to learn the *Yogacarya-bhumi Sastra* from your Reverence, and thus all my doubts have been solved. I have visited the various holy places and studied the teachings of the different schools to my great content that I feel I have not come in vain. Now I wish to return home to translate the books that I have learned into Chinese, so that those who have the good chance may also study them. In this way I wish to repay the kindness of my teacher, and that is why I do not wish to linger here any longer."

Silabhadra was quite pleased to hear this and said: "This is indeed the wish of a Bodhisattva and it is also what I expect of you. Let him make the necessary arrangements and you people need not try to detain him any more."

Two days afterwards the envoy of King Kumara of East India arrived with a letter for Silabhadra, in which the king said: "Your disciple wishes to see the venerable monk of China. May the teacher be kind enough to let him come so as to satisfy my wish."

After receiving the letter, Silabhadra said to the monks: "King Kumara desires to invite Hsuan-tsang to his country. But he has already been appointed by the community to go to King Siladitya to debate with the Hinayanists. If he goes now where shall we find him again, should King Siladitya send for him? We should not let him go."

Then he said to the envoy: "The Chinese monk is preparing to return to his own country and has no time to accept the king's invitation."

When the envoy returned home, the king send him again with the messages, saying: “Even if the teacher is intending to go back to his own country, it will not be difficult for him to come to my place for sometime before he leaves. May you comply with my request and do not decline my invitation again.”

But Silabhadra still would not let him go, and thus the king was greatly enraged [threatened to destroy the Nalanda Monastery…]

Yuan Chwang goes to meet King Kumara:

On receiving this letter Silabhadra said to the Master.

“You had better go to him since we renounced our homes for the benefit of others and this is the right time to carry out our duties. It is like cutting a tree – you just break the root and the branches will wither by themselves. You may go there and make the king a Buddhist, and then this people will follow his example. If you do not accept his invitation, something disastrous might happen. I wish you will not refuse the trouble of going there.”

Thus the Master took leave of his teacher and went away with the king’s envoy.

The Master stayed there for more than a month.

When King Siladitya returned from his campaign in Konyodha, he heard that the Master was at Kumara’s place.

King Siladitya sends for Yuan Chwang:

He sent an envoy to King Kumara, asking him to send the Chinese monk to him immediately. But king Kumara said: “You could have my head, but I will not let the Master come immediately.” (Siladitya responded that the king may send his head back with his envoy…)

King Kumara feared that he had spoken wrongly, and he immediately gave order to arrange 20,000 elephant troops in 30,000 boats and sailed together with the Master along the Ganges to the place of King Siladitya. When they reached the country of Kajangala (probably situated at Sicligully or Rajmahal, or in their vicinity) they met King Siladitya.

Before he started the voyage, King Kumara had sent his men to prepare a temporary palace at the northern side of the Ganges. On the day of his

arrival he crossed the river and reached his temporary palace, and after having lodged the Master in his palace, he and his ministers went to see King Siladitya at the southern side of the river.

It was the custom of King Siladitya that wherever he went a number of several hundred golden drums were beaten to keep time with his pace and this was called as the "pace-rhythm drum". Only King Siladitya enjoyed such a privilege and no other kings had the same honour.

When he had arrived, he worshipped the Master at his feet and scattered flowers with adoration. After having praised the Master with numerous eulogistic stanzas, he said to him: "How is it that you did not come when I previously invited you?"

The Master replied: "I came from a distant land to seek for Buddhism and to learn the *Yogacarya-bhumi Sastra*. When I received your order I was just in the midst of learning the *Sastra* and so I was unable to come to pay my respect".

The king asked again: "You came from China, and I have heard that you have a musical composition called as the '*Triumph of the Prince of Chin*' in your country. I do not know who this Prince of Chin is and what meritorious deeds he has done so as to earn such praises for himself."

The master said: "It is the custom of my country that the people composed songs in praise of that sagacious and virtuous person who could suppress evil powers for the people and be advantageous to all. These songs are either sung on ceremonial occasions in the ancestral temple, or sung by the common people as folk-songs. The prince of Chin is the present emperor of China, and he was made the Prince of Chin before he ascended the throne. At that time the whole country was in a condition of complete tumult without a lord to rule over the people. Human corpses piled high in the wild fields and human blood flowed in the rivers. Evil stars appeared in the sky at night and an ominous atmosphere condensed during the day. The three rivers were suffering under avaricious pigs and the four seas were troubled by poisonous snakes. Being a son of the emperor, the prince led his troops personally and suppressed the rebellious forces, in compliance with the order of Heaven. With his military power he established peace in the whole country and restored tranquillity in the universe, making the sun, the moon and the stars shine brightly again. As the people in the whole country felt grateful to him, they composed that music in praise of him."

The king remarked: “Such a man is indeed sent by Heaven to be the ruler of men!”

In the morning of the following day an envoy of King Siladitya arrived, and so the Master and King Kumara went together to King Siladitya. When they had reached the side of King Siladitya’s palace, the king and more than twenty of his personal teachers came out to receive the Master and invited him to take a seat in his palace.

After having entertained him with the performance of music and delicious food, and after having scattered flowers, the king said: “I have heard that the teacher has composed the *Refutation of Evil Views*. Where is the book now?”

The Master said that it was in hand and presented it to the king. After reading the treatise, the king was quite delighted and said to his personal teachers: “I have heard that when the sun is shining, the light of a candle is dimmed, and when the heaven thunders, the noise of a hammer is muffled. Now he has refuted all the theories which you teachers have always adhered to. Would you try to save them?”

But none of the monks dared to say anything.

King Siladitya arranges debate between Hsuan-tsang and the Hinayana monks:

The king said: “Your treatise is excellent. I and my teachers here all believe in it. But as I fear that the Hinayanists and heretics of the other countries may still keep their ignorant views, I wish to hold a meeting for you at Kanyakubja and invite all the monks and Brahmanic heretics of the five Indias to come, so as to show them the wonderful and subtle teachings of Mahayana Buddhism in order to prevent them from slandering it, as well as to exhibit your rich virtues in order to subjugate their arrogance.”

At the beginning of the eleventh month, the Master sailed together with the king up the Ganges and arrived at the place of meeting in the twelfth month. Eighteen kings of the five Indias were present in the meeting, and a number of more than 3,000 monks who were learned in both Mahayana and Hinayana teachings, more than 2,000 Brahmanic and Nirgrantha heretics and more than 1,000 monks of the Nalanda Monastery had also come to the assembly. All these scholars were widely learned and talented in debate,

and they all came to attend the meeting with the desire to hear the Law. They had attendants and came either by elephants or by carriages, and they were surrounded by pennants or banners in a great congregation, overcrowding in an area of several tens of *li* just like a conglomeration of clouds.

The king had beforehand ordered his people to construct two thatched halls at the place of meeting to install the Buddha's image and to accommodate the monks. When he reached there, both of the two halls had already been built. They were spacious, each being capable of containing 1,000 men. The king's temporary palace was at a distance of five *li* to the west of the place of meeting.

The king made a golden image of the Buddha in his palace, and he caparisoned a large elephant. On the elephant, behind precious curtains, was installed the Buddha's image. King Siladitya dressed himself like Indra, and holding a white duster he attended at the right side, while King Kumara dressed himself like Brahma, and holding a precious umbrella he attended at the left side. Both of them, wearing heavenly crowns, were adorned with garlands and strings of pearls and jade. Two other caparisoned elephants carried flowers and followed behind the Buddha's image. The flowers were scattered as the elephants went along the road. The Master and the king's personal teachers rode on different elephants and followed behind the kings. The kings, ministers and monks of great virtue of the various countries rode on three hundred large elephants that walked by the side of the road, and chanted praise as they proceeded. They dressed themselves in the morning and, starting from the king's temporary palace, they proceeded towards the place of meeting.

They alighted from the elephants when they reached the gate of the courtyard, and carried the Buddha's image into the hall, in which it was placed on a precious throne.

After the meal he offered to the Buddha's image one golden tray, seven golden bowls, one golden bathing-jar, one golden religious staff, three thousand golden coins and three thousand robes made of the finest felt. The Master and the other monks all received different offerings.

When the offerings had been made, the Master was invited to sit on a specially decorated seat to be the chairman of the meeting to propagate Mahayana Buddhism and to expound the meaning of his treatise. The

Venerable Vidyabhadra, a monk of the Nalanda Monastery, was appointed to read out the treatise to the audience, while a written copy of the same was hung outside the gate of the place of meeting for the public to read, with the announcement that if one single word in the treatise was found illogical and refutable, the writer would cut his head in apology. But, till as late as nightfall, nobody had ventured to raise an objection. Being greatly delighted, King Siladitya adjourned the meeting and returned to his palace. The other kings and monks all returned to their different places, and the Master, accompanied by King Kumara, returned to the palace.

Attempt to murder Yuan Chwang:

In the morning of the following day they assembled again, carrying the Buddha's image in a procession in the same way as on the previous day. Five days afterwards the Hinayanists and the heretics, seeing that the Master had destroyed their doctrines, tried to murder him with a feeling of hatred.

Being informed of this intrigue, the king issued an order, saying: "… Anyone among the congregation who dares to injure the Master will be beheaded, and anyone who insults him will have his tongue cut off. But those who wish to argue with him in defence of their doctrines are not prohibited from doing so."

Thenceforward the evil people were subdued, and for a period of eighteen days nobody was able to raise an objection in debate. In the evening when the meeting was to be dispersed, the Master furthermore praised Mahayana Buddhism and extolled the merits of the Buddha, making numerous people give up what was wrong and accept what was right, and converting them from Hinayana teachings to Mahayana Buddhism. Thus King Siladitya respected him all the more and presented him with 10,000 golden coins, 30,000 silver coins and 100 robes made of the finest felt. The eighteen kings also offered him different jewels and precious articles. But the Master accepted none of the offerings.

The king ordered his attending ministers to decorate a large elephant with tapestries and invited the Master to ride on it and go through the crowd, accompanied and protected by his noble ministers, to announce that he had

established his theories unchallenged. It was the custom in the western countries that the winner in debate was always honoured in this way.

The Master declined the honour and would not go, but the king said: "This is an ancient custom and we should not act against it."

Then the Master's robe was placed on the elephant and a man announced to the public, saying: "The Chinese teacher has established the teachings of Mahayana Buddhism and has refuted the various heterodox views. For a period of eighteen days, none has ventured to raise an objection in debate. Let all the people be informed of this fact."

As the Master had already taken leave of the virtuous monks of the Nalanda Monastery and collected his scriptures and images of the Buddha, he desired to take leave of the king and return home on the nineteenth day when the meeting was over. The king said: "Since I ascended the throne to be the lord of the world, it has been more than thirty years. I have always been worried that my felicity and virtue will not increase and that my good causes of the past will not continue. Therefore, I accumulated wealth and valuables and made a great meeting place between the two rivers in the country of Prayaga, (modern Allahabad) and invited all the monks, Brahmanas and the poor and the lonely people to receive my unlimited offerings for a period of seventy-five days in every five years. I have already conducted five such meetings and I am now going to hold the sixth meeting. Would you not like to come and join in the meeting?"

The Master said in reply: "When a Bodhisattva practices the Way, he tries to cultivate both worldly welfare and spiritual wisdom, and when a wise man has obtained the fruit, he never forgets about the tree. If Your Majesty is generous in giving his wealth to the people, why should I not stay here a little longer? Please let me go with you."

Alms-giving by King Siladitya at Prayag:

On the twenty-first day they started for the place of great alms-giving in the country of Prayaga. The Ganges was in the north while the Jumna, in the south, both flowing from the north-west towards the east, met in this country. To the west of the confluence of the two rivers, was a great tableland about fourteen or fifteen *li* in circuit, which was as flat as a mirror. The kings of the past all came to this place to give alms, and so it was

called the place of alms-giving. It was said in tradition that the merit of giving one coin at this place was greater than the merit of giving hundreds or thousands of coins at other places. Thus the people valued this place since the old times.

The king had ordered a meeting place for alms-giving to be built on the tableland, surrounded with a fence of reeds, one thousand paces long on each side. Within the fence were built several tens of thatched halls to store the various sorts of precious articles, such as gold, silver, pearls, red agate, emerald, sapphire, etc. Beside the halls were several hundred rooms in rows to store robes made of silk and spotted felt, gold and silver money, etc. Outside the fence was a separate place for cooking food. In front of the treasure-houses, houses were constructed in more than a hundred rows, resembling the shops in our capital, and each row of the houses was capable of seating more than one thousand men.

The king had beforehand issued an order inviting all the monks, heretics, Nirgranthas, the poor and the lonely of the five Indias to assemble at the place of alms-giving to receive alms. Some of the people who attended the Master's discussion meeting at Kanyakubja did not return home, but went directly to the place of alms-giving. The kings of eighteen countries also followed King Siladitya to that place. When they reached the place of meeting, a number of more than 500,000 men, including monks and laymen, were present. King Siladitya encamped on the northern bank of the Ganges, and King Dhruvabhata of South India encamped at the west side of the confluence, while King Kumara encamped beside a flower forest on the southern bank of the Jumna and the almsmen encamped to the west of King Dhruvabhata's camp.

On the following morning King Siladitya and King Kumara going by warships, and King Dhruvabhata, followed by his elephant troops, went to the place of alms-giving, all attended by properly arranged bodyguards. The kings of eighteen countries and those below in rank accompanied them.

On the first day they installed the Buddha's image in the thatched hall at the place of alms-giving. They offered to it the best of the valuables, and robes and delicious foods, to the playing of music and scattering of flowers, till the evening when they returned to their camps.

On the second day they installed the image of Surya, to which they offered half the amount of valuables and robes as they had offered to the

Buddha's image on the first day.

On the third day they installed the image of Isvaradeva, to which the offerings were the same as those made to the Surya.

On the fourth day alms were distributed to a number of more than 10,000 monks who sat in one hundred rows. Each of them was presented with one hundred golden coins, one piece of pearl, and one suit of felt robe, together with food, drink, incense and flowers. They came out of the place when they had received the offerings.

The fifth group was the Brahmanas. It took more than twenty days to make offerings to them all.

The heretics formed the sixth group. It took ten days to distribute alms to them.

The seventh group consisted of those people who came from distant lands, and ten days were occupied in distributing alms to them all.

The poor and the lonely formed the eighth group. This distribution took one month.

Thus the king exhausted all he had stored in his treasure-house during the last five years, except his elephants, horses and weapons which he kept for the purpose of suppressing rebellions and protecting his ancestral temple. All other valuables including his own garments, pearls, ear-rings, bracelets, jewels, necklace and the precious pearl in his headdress, were given to the people as alms without omitting a single article.

When he had given all his properties, he asked his younger sister to give him some coarse garment to wear, and he saluted all the Buddhas in the ten quarters with a happy mind. With his hands joined palm to palm he said: "Since I accumulated these properties I have always feared that they could not be kept in a strong store-house. Now I have stored them all in the field of good deeds, and they are now really stored in the proper place. I wish that I shall always be able to possess both worldly wealth and the Buddha's Law in all my future lives, so that I may give them to all living beings in order to achieve the Ten Stages of Freedom[420] and the Two Glories."[421]

When the meeting was over, the kings of the various countries gave their different valuables and money to the people to redeem the pearls, the headdress jewel and the royal garment which King Siladitya had given to

them as alms, and presented the same to him. Thus after a few days the king wore his royal garment and his best ornaments as usual.

The Master then desired to take his leave and return home, but the king said: “As I am intending to work with you to spread the bequeathed Law of the Buddha, why do you want to go back so soon?” And so he stayed for another period of more than ten days.

King Kumara also was anxious to detain him and said to the Master: “If you come to stay in my country to receive my offerings, I will build one hundred monasteries for you.”

Yuan Chwang desires to return home:

On seeing that the Kings would not let him go, the Master appealed to them sincerely saying: “China is far away from here and Buddhism was known there at a very late time. Although we knew something about Buddhism, we could not understand its complete teachings. That was why I came here to search for what was unknown to us. It is owing to the sincerity of the sages of my country who longed to study Buddhism that I have been able to fulfill my desires. Therefore, I could never forget them. It is said in the scriptures that those who obstruct the spreading of the Law will be reborn without eyes for many lives in the future. If you keep me in this country, you would deprive many people in that land of the advantage of learning the Law. Wouldn’t it be fearful to suffer the retribution of being born without eyes?”

The Kings facilitate his return:

With his scriptures and Buddha’s images, the Master travelled together with the army of King Udita of North India, and riding on a horse he proceeded onwards. King Siladitya also gave one big elephant, 3,000 golden coins and 10,000 silver coins to King Udita to cover the Master’s travelling expenses. Three days after departure, the king together with King Kumara and King Dhruvapata, each attended by several hundred horsemen, came again to say farewell to him – so greatly did they respect him. He also sent four officials, called Mahataras, to send letters written by the king on white silk and sealed with red seals, to the various countries through which

the Master would pass, requesting the authorities to supply him with horses and escort him until he reached the land of Han.

Starting from the country of Prayaga, he travelled towards the south-west and walking for seven days through a big wild forest, he reached the country of Kausambi. To the south of the city was the garden which was presented to the Buddha by the elder Ghosila. After having paid homage to the holy place, he travelled again with King Udita towards the north-west.

Meeting with Simhaprabha and Simhacandra before departing:

Proceeding further towards the north-west for three *yojanas*, he reached the capital of Vilasana,[422] where he stayed for two months and met with two schoolmates, Simhaprabha and Simhacandra, who were preaching on the *Abhidharma-Kosa Sastra*, the *Mahayana-samgraha Sastra* and the *Vidyamatra-Siddhi Sastra.* Both welcomed him with delight. The Master lectured on the *Yogadharma Sastra* and the *Abhidharma-samuccaya-vyakhya Sastra* for a period of two months, after which he took his leave.

Going north-west for more than a month and passing through several countries, he reached the country of Jalandhara (modern Jalandhar) which was the capital of the king of the North India, where he again stayed for a month. King Udita then appointed men to escort him towards the west. Travelling for twenty days, he reached the country of Simhapura.[423]

Mishap on the return journey:

After staying for seven days, he travelled again towards the north-west for three days and reached the great Indus River, which here was five or six *li* wide. His scriptures and Buddha's images were loaded into a boat with his companions to cross the river, while the Master waded across on his elephant. He had appointed a man to take care of the scriptures and some seeds of rare Indian flowers. When the boat reached the middle of the river, a hurricane suddenly arose shaking the boat and nearly overturned it. The man who looked after the scriptures was so frightened that he fell overboard, but was rescued by the others. Fifty fascicles of scriptures and the flower seeds were lost, while his other things narrowly escaped damage.

The king of Kapisa who was in the city of Udakakhanda (modern Und, north of Attock) hearing of the arrival of the Master, personally came to the riverside to welcome him, and inquired: "I hear that you have lost some scriptures in the river. Did you bring any seeds of Indian flowers or fruits?"

The master replied: "Yes, I did".

The king said: "That was the cause of the hurricane which nearly overturned your boat. Since ancient times anyone who tried to bring flower seeds across the river always met with such an accident."

Then he returned to the city with the Master, who stayed in a monastery for more than fifty days. In order to replace the lost scriptures, he sent some men to the country of Udyana to copy the *Tripitaka* of the Kasyapiya School.

Having heard of the Master's arrival, the king of Kasmira came personally to pay his homage to him, regardless of the long distance, and returned home after spending a whole day with him.

The Master and the king of Kapisa travelled together towards the north-west for more than a month and reached the domain of the country of Lampaka (modern Lamghan near the source of the Kabul River).

Arriving in the capital, the Master stayed in a Mahayana Monastery, and the king convoked a great alms-giving meeting for seventy-five days.

Yuan Chwang continues the journey homeward:

… the Master reached the country of Kustana (modern Khotan, Sinkiang Uighur). A greater part of the country was desert. This country yielded cereals in abundance. It produced rugs and fine felt, and felt makers also weaved silk. The land produced much white jade and black jade. The climate was temperate, and the people were civilised and fond of learning and music. They had a good deportment which was different from the custom of the other Hu peoples. Their system of writing was derived from the Indian language, having only slight variations. They believed in Buddhism and had 100 monasteries with more than 5,000 monks, most of whom studied Mahayana Buddhism.

The king was a brave and warlike man and he respected and loved men of virtue. He claimed to be a descendant of Vaisravana-*deva*. His ancestor was a prince of King Asoka, who lived in the country of Taksasila and was later

exiled to the north of the Snow Mountain to be a shepherd. In the course of looking for water and pasture, he came to this place where he founded his capital. For a long time he did not have a son, and so he prayed for one in the temple of Vaisravana-*deva*, from whose forehead a son was born to him. Moreover the ground in front of the temple produced a kind of wonderful liquid which was as sweet and fragrant as milk. This was brought to feed the child and he gradually grew up. After the death of the king, his son succeeded him, and his political influence reached far and wide and his military strength surpassed all the other countries. The reigning king was a descendant of that king. As his ancestor was brought up with "earth-milk," so the country was called as "Ku-stana" (earth-teat).

… as the Master had lost some scriptures when he was crossing the Indus, he sent some men to Kucha and Kashgar after having arrived in this country, to look for new texts to replace the lost ones.

Yuan Chwang writes to the Chinese emperor:

The king of Kustana invited the Master to stay for some time. As he could not continue his return journey at once, he wrote a letter and asked a young man of Kaochang to go with some traders and send it to the Court of China, informing the emperor that he had gone to the Brahmanic countries to seek for the Law and was now at Kustana on his return journey. The letter said:

"Hsuan-tsang had formerly thought that, although Buddhism which flourished in the western countries, had been introduced to the East, the teachings were far from being complete, in spite of the fact that the holy scriptures had come to us. Thus I had always intended to make further inquirers. And so in the fourth month of the third year of Chen Kuan (AD 629) I started privately for India in violation of the imperial law….

Though I travelled through many different countries and experienced all kinds of hardship, I met with no obstruction on the way owing to the imperial influence of Your Majesty. As I have always been treated with hospitality, I do not feel any tiredness. In fulfilment of my wishes, I have visited the Grdhrakuta Mountain and worshipped the Bodhi-tree. I have seen what I never saw before and have read the scriptures which I never read before. I have seen all the wonders of the universe and have seen the manifestations of nature, and I have also proclaimed the virtue of Your

Majesty so as to win the respect and admiration of the foreign peoples. After having spent seventeen years in my journey, leaving the country of Prayaga, passing through the domain of Kapisa, climbing over the Pamir Ranges and crossing the Pamir Valley, I have now reached Kustana on my return journey. As my elephant has been drowned and I have brought with me a great amount of scriptures for which I have not yet found horses to carry, I have to stop on the way for some time and am unable to hasten to see Your Majesty at an earlier moment. For this I feel deep regret. Now I am sending Ma Hsuan-chih, a layman of Kaochang, to come with some traders to submit this letter to Your Majesty beforehand."

The emperor welcomes the pilgrim:

After the lapse of seven or eight months, the messenger returned with an imperial decree to welcome and console the Master. It said: "I am highly delighted to hear that the teacher is returning home after seeking for the Way in the foreign lands. You may come to see me as quickly as possible, and you may, as well, bring the foreign monks who understand the Sanskrit language and the meanings of the scriptures to come with you. I have already ordered the authorities of Kustana and the other regions to escort you, and so you will not be in want of carriers and horses. I have also instructed the officials of Tunhuang to receive you at the Desert, as well as those of Shanshan to receive you at Chemo."

When he had arrived at Shachou, he wrote another letter to the emperor, who was then in his palace at Loyang. On receiving this letter, the emperor knew that the Master was approaching, and instructed Prime Minister Fang Hsuan-ling, the Duke of Liang Kuo, who was then the Imperial Guard of the Western Capital, to issue orders to the authorities to welcome the Master.

Having heard that the emperor was about to leave on a military expedition for a region near the Liao River, the Master did not wish to delay on the way, but proceeded with double speed and reached the Canal very soon.

BOOK VI ('LIFE')

Yuan Chwang is received with honour:

On the seventh day of the first month in the spring of the nineteenth year of Cheng Kuan (AD 645), Prime Minister Fang Hsuan-ling, who was the Duke of Liang Kuo and the Imperial Guard of the Capital, sent Hou-mochen Shih, the Great General of You Wu Hou, Li Shu-shen, the Governor of Yungchou, and Li Chien-you, the Magistrate of Changan, to receive the Master when he arrived with the scriptures and images of the Buddha.

On that day the authorities instructed the various monasteries to prepare banners and tapestries to send the scriptures and images of the Buddha to the Hung Fu Monastery. The people were glad to make the required arrangements, and on the following day they assembled at the south end of The Red Bird Street. Several hundred receptacles were arranged in rows to receive the scriptures and images of the Buddha which the Master had obtained in the western countries, including 150 grains of red sarira of the Tathagata; one golden replica of the Buddha's shadow-image in the Dragon Cave on the Pragbodhi Mountain in Magadha, three feet and three inches high including the stand; one sandalwood image of the Buddha, three feet and five inches high including the stand, made in imitation of the image of Turning the Wheel of Law at the Deer Park in Benares; one sandalwood image of the Buddha, two feet and nine inches high including the stand, made in imitation of the sandalwood images carved by King Udayana of Kausambi when he was desirous of seeing the Tathagata; one silver image of the Buddha, four feet high including the stand, made in imitation of the image of the Tathagata descending from heaven on the Precious Terrace in Kapitha; one golden image of the Buddha, three feet and five inches high including the stand, made in imitation of the image of the Buddha as preaching the *Saddharmapundarika Sutra,* etc., on the Vulture Peak in Magadha; one sandalwood image of the Buddha, one foot and three inches high including the stand, carved in imitation of the shadow-image of the Buddha as subduing a poisonous dragon in Nagarahara; one sandalwood image of the Buddha as going on his daily round for alms in Vaisali; and some other images of the Buddha.

They also received the scriptures which the Master had obtained in the western countries, namely, 224 books of Mahayana *Sutras*, 192 books of Mahayana *Sastras*, 15 books of the *Tripitaka* of the Sthavira School, 15 books of the *Tripitaka* of the Sammatiya school, 22 books of the *Tripitaka*

of the Mahisasaka School, 17 books of the *Tripitaka* of the Kasyapiya School, 42 books of the *Tripitaka* of the Dharmagupta School, 67 books of the *Tripitaka* of the Sarvastivadin School, 36 books concerning the *Hetuvidya Sastra* and 13 books concerning the *Sabdavidya Sastra,* making a total number of 657 books, bound in 520 cases, being loaded on twenty horses.

For a distance of several tens of *li*, beginning from The Red Bird Street and ending at the main gate of the Hung Fu Monastery, the people of the capital, scholars and imperial and local officials, stood by the sides of the road and looked on the procession with respect. Those who joined in the procession forgot the dust and their tiredness and declared that it was a rare occurrence, and that they were delighted at being present on that rare occasion. As the street was overcrowded, the authorities, fearing that the people might tread upon one another, ordered that they should not move and that they should burn incenses and scatter flowers only at the places where they were standing. Thus the smoke of incense and the voice of praise progressed from place to place.

Yuan Chwang meets the Emperor:

On the first day of the second month the emperor received him in the Yi Luan Palace with great favour. Having sat down the emperor asked: “Why did you go (to India) without telling me?”

The Master replied with apology: “When I was preparing for my journey, I had sent petitions to Your Majesty several times, but as my project was unworthy, I did not enjoy the favour of being granted with an official permission. Because of my utmost sincerity for seeking the Law, I went away privately, for which offence I beg the pardon of Your Majesty.”

The emperor said: “Since you are a monk, you are different from lay people in this matter. I am delighted that you went to seek for the Law at the risk of your life for the benefit of all the people. There is no need to ask my pardon. I wonder how you managed to reach that country at so great a distance beyond mountains and rivers with different people with strange customs.”

The Master said in reply: “I have heard that it is not far to reach the Heavenly Lake for those who could ride on a speedy wind, and it is not

difficult to cross a stormy river, if one sailed in a dragon-boat. Since Your Majesty ascended the throne to rule over the country, your virtue and benevolence prevailed in all the areas, with the wind of morality blowing to the hot countries in the south and your political influence reaching as far as beyond the Pamirs. Therefore, when the sovereigns of the foreign people saw a bird flying from the east, they would suspect it as coming from the supreme country and would bow to it to show their respect, not to say that I am a human being under the protection of Your Majesty. It is owing to the imperial influence of Your Majesty that I have been able to go and return without any difficulty."

The emperor remarked: "You say so out of politeness, and I am not worthy of such praises."

The emperor asks Yuan Chwang to write about his journey:

The emperor said to the Master: "As the Buddhist country is far away from our country and there is no detailed record of the holy places and Buddhist teachings in our historical books, you should write an account of the places which you have visited in person so as to inform those who have not heard of them."

Yuan Chwang unveils his translation project:

The Master said to the emperor: "I have brought back more than 600 volumes of Sanskrit scriptures, of which not a word has been translated into Chinese. I know of the Shao Lin Monastery at the south of the Sung Mountain and the north of the Shao Shih Mountain, situated at a quiet place far from noisy towns and villages. It was built by Emperor Hsiao Wen of the Later Wei dynasty and it was the place where Bodhiruci translated Buddhist scriptures into Chinese. I wish to stay at that place to translate the Sanskrit texts. I am waiting for an imperial approval."

The emperor said: "You need not go to the mountains. After you had gone to the West, I had constructed in memory of my queen mother Mu, the Hung Fu Monastery in the Western Capital (Changan in present-day Shensi Province), which is a quiet place suitable for you to translate the Buddhists scriptures."

The Master responded: “As curious people know that I have returned from the West, they flock together to see me and make my place as noisy as a market. Their behaviour is not only against the law, but it also hinders me in my religious affairs. I hope that gate-keepers will be appointed to prevent them from committing blunders.”

Yuan Chwang moves to the Hung Fu Monastery:

On the first day of the third month the Master returned to Changan from Loyang and lived in the Hung Fu Monastery. Before he started his translation work, he sent a petition to Prime Minister Fang Hsuan-ling, the Imperial Guard of the Capital and the Duke of Liang Kuo, requesting him to provide the necessary assistant translators, grammarians, stenographers and copyists. Fang Hsuan-ling ordered the authorities to make a report to the emperor at Tingchow, who issued a decree to the effect that whatever the Master needed must be provided sufficiently.

On the second day of the sixth month in the summer twelve renowned monks arrived who were well versed in both Mahayana and Hinayana *Sutras* and *Sastras* were appointed to be his assistant translators.

There arrived also nine grammarians, one etymologist, and one Sanskrit scholar.

There arrived also some stenographers and copyists, together with the necessary appliances which the authorities had supplied.

Yuan Chwang begins his work:

On the first day of the seventh month the Master started to translate the palm-leaf Sanskrit scriptures, and at the beginning he translated the *Bodhisattva-pitaka Sutra,* the *Buddha-bhumi Sutra,* the *Sanmukha-dharani Sutra,* and the *Prakaranaryavaca Sastra.* He completed the translation of the *Sanmukha-dharani Sutra* on that same day and finished the translation of the *Buddha-bhumi Sutra* on the fifteenth day. While the *Bodhisattva-pitaka Sutra* and the *Prakaranaryavaca Sastra* were done by the end of the year.

On the first day of the first month in the spring of the twentieth year (AD 646) he again translated the *Mahayanabhidharma-samyuktasangiti Sastra*

and finished it in the second month, after which he again translated the *Yogacarya-bhumi Sastra*.

On the first day of the seventh month in the autumn the Master presented the translated scriptures to the emperor… and he also completed his *Record of the Western Countries* as was ordered by the emperor when he saw him at Loyang….

In the spring of the twenty-second year (AD 648) the emperor visited the Yu Hua Palace. On the fourteenth day of the fifth month in the summer the Master completed the translation of the *Yogacarya-bhumi Sastra* in 100 volumes.

On the eleventh day of the sixth month the emperor invited the Master to the (Yu Hua) Palace.

The emperor inquired of the Master what scripture he had been translating. In reply the Master said: "I have recently completed the translation of the *Yogacarya-bhumi Sastra* in 100 volumes.

The emperor commented: "That is a voluminous work. Who wrote this book and what is it about?"

The Master replied, saying, "It is taught by Maitreya Bodhisattva in exposition of the seventeen stages of Bodhisattvaship."

The emperor writes the Preface for Yuan Chwang's translated scriptures:

The emperor had earlier consented to compose a preface to the newly translated scriptures, but as he was busily engaged in state affairs, he did not have time to make the composition. The Master requested him again to do it, and so in a short time the emperor wrote the "*Preface to the Holy Teachings of the Tripitaka of the Great Tang Dynasty*" in 781 characters, which he copied with his own hand and ordered to be put at the beginning of the scriptures. In the Ching Fu Palace the emperor, being attended by all his ministers, asked the Master to be seated, and ordered Shangkuan Yi, a scholar of the Imperial Institute, to read the preface which he had composed in the most elegant style with much praise about Buddhism.

BOOK VII ('*LIFE*')

Yuan Chwang continues his work:

…the new translation of the *Vajracchedika-Prajna-paramita-Sutra* was entirely based on the Sanskrit text. When it was reported to the emperor, he was greatly pleased.

In the tenth month in the winter, the emperor returned to the capital, and the Master returned with him. The emperor had previously ordered the authorities to build a house, with the name of the "Hung Fa Court" at the west of the Tzu Wei Palace in the north of the Imperial Residence. On his arrival the Master stayed in this new house, and he was invited to converse with the emperor during the daytime, while he returned to the Hung Fa Court at night to spend his time in translating the scriptures. He completed the translation of the *Mahayana-samgraha Sastra* with commentaries by Asvabhava Bodhisattva in 10 volumes, the same *Sastra* with commentaries by Vasubandhu in 10 volumes, the *Pratitya-samutpada Sutra* in one volume and the *Satadharmavidyanikaya Sastra* in one volume.

Letter from the monks Jnanaprabha and Prajnadeva:

On the twenty-third day of the fifth month in the summer, Jnanaprabha and Prajnadeva, two monks of the Mahabodhi Monastery in Central India, wrote a letter to the master. Jnanaprabha was thoroughly learned in both Mahayana and Hinayana scriptures, as well as in such heretical books as the *Four Vedas* and the treatises of the Five Knowledges. Being a prominent disciple of the Venerable Silabhadra, he was respected by the scholars of the five Indias. Prajnadeva was an expert in the teachings of the eighteen Hinayana Schools and was also respected by the people. When the Master was travelling in the west, he used to discuss Buddhism with them. Although they were well-learned in Hinayana teachings, they did not know much about the Vaipulya doctrines. For their persistence in biased opinions, the Master used to censure them. In the religious meeting held at Kanyakubja they were once again defeated by him in debate, and acknowledged frustration with a sense of shame. Since the Master parted with them, they always remembered him with admiration. So they entrusted Dharmarudha, a fellow-monk of their monastery, with a letter to him to convey their greetings with two rolls of cotton cloth as a token of their deep veneration. In the letter they said:

"The Venerable Prajnadeva, who is surrounded by a group of well-learned scholars, of the Mahabodhi Monastery at the Varjrasana of the Buddha, the Abstruse and Auspicious One, sends his best greetings to the Moksacarya of Maha-Cina who is erudite in the sublime teachings of the *Tripitaka*, and wishes him in his best health.

"I, Bhiksu, Prajnadeva, have composed a stanza in praise of the great divine powers of the Buddha, as well as the *Sutras*, *Sastras* and the Four Noble Truths, which I have entrusted Bhiksu Dharmarudha to send to you.

"The old virtuous Acarya Jnanaprabha of this place whose knowledge is unlimited, also sends his greetings to you, and Upasaka Suryalabdha also pays homage to you.

"We are now sending you two rolls of white cotton cloth to show our remembrance of you. As the way is too far we hope that you will accept it without thinking it is so small a gift. If you are in need of any *Sutra* or *Sastra*, you may just give us a list and we shall make copies of the required books for your use.

"May the Moksacarya note the above."

This shows how the Master was admired by the scholars in the distant lands.

Reply to Jnanaprabha:

In the second month in the spring of the fifth year (of Yung Hui, AD 654), Dharmarudha took his leave to return home and asked the Master to make a reply. The Master wrote a letter in reply and prepared some gifts, which he gave to the messenger after having made a report to the emperor. In the letter he said:

"Bhiksu Hsuan-tsang of the great Kingdom of Tang begs to send his greetings to the Venerable Jnanaprabha, the *Tripitaka*-Master of Magadha in central India. It is more than ten years since we parted, and as we are separated by a long distance, I have scarcely heard of you. My remembrance of you increases as the time passes. When Bhiksu Dharmarudha arrived he conveyed your kind regards to me and informed me that you were in your best health. His information made me feel as if I saw you with my own eyes and my pleasure was indescribable. The season is becoming warmer and I wonder how you are getting on since you wrote

me that letter. Some years ago our envoy returned from India and informed me that the Right Dharma-Keeper had shown the principle of Impermanence, which was indeed sad news for me. The boat on the sea of suffering has sunk and the eyes of *devas* and men have closed. His death is all too soon for us. The Right Dharma-Keeper had cultivated good deeds and performed meritorious acts during a long period in his past lives, and thus he inherited the good nature of equanimity and peace, and was endowed with great and eminent talents. He succeeded Aryadeva and continued the Brilliancy of Nagarjuna. He re-lit the torch of wisdom and re-established the banner of *Dharma*, and thus he quenched the flame of heterodox views and changed the current in the sea of mistaken theories, exhorted the lazy people to go onward to the place of treasure and showed the right direction to those who lost their way. He was a great and magnificent pillar in the gate of Buddhism. Moreover, he was well versed in the teachings of both Mahayana and Hinayana Buddhism, and fully understood the heterodox theories of annihilation and permanence. He could understand the most difficult literature and make abstruse meanings clear to all. Therefore, both Buddhists and non-Buddhists became his pupils and regarded him as a great teacher of India. He taught his students day and night without feeling tired and satisfied them all according to their different requirements. When I was studying in India he enlightened me with his kind instructions, and stupid as I am, I have been highly benefited by his teaching. He gave me special instructions when I left him to return to my own county, and his kind words are still sounding in my ears. I hoped that he would live long to propagate the teachings of the Buddha and never expected that he should have died so soon. It is unbearable for me to think of this sad event of my teacher. You studied under him for a long time and are a great disciple of the teacher. It must be hard for you to suppress your emotion after his death. What can we do? We can't help it since such is the law of impermanence! I hope you will overcome your sad feelings. When the Enlightened One passed away, Mahakasyapa succeeded him in his great task, and after the death of Sanakavasa, Upagupta continued to disseminate his good teachings. Now the teacher is dead and it is your turn to succeed to his post. I hope your eloquence in preaching will always be as fluent as the water in the fours seas, and your adornments of felicity and wisdom will be as permanent as the five mountains. Of the scriptures and commentaries

which I have brought back from India, I have already translated into Chinese the *Yogacarya-bhumi Sastra* and some other books of a total number of more than thirty works. The *Abhidharma-Kosa Sastra* and the *Abhidharma-nyayanusara* are in the course of translation and will be competed in this year. The Emperor of the great Kingdom of Tang, who is in his best health and enjoys all sorts of felicity in a land of peace, and who is spreading the Buddha's teachings with the compassion of a king of Cakravarti, has personally composed an imperial preface to all the Chinese translations of the scriptures and commentaries, and ordered the authorities to copy them for circulation in the whole country as well as in the neighbouring lands. Although we are at the end of the Semblance Period, the brilliant doctrine of Buddhism is still as prosperous as it was taught in the Jetavana Garden in Sravasti. This you may be interested to know. When I was crossing the Indus I lost a horse-load of scriptures in the river, of which I have made the attached list, and I hope you will kindly send the books to me at your convenience. Attached under separate cover is some small gift from me. As the way is far, I could not send more gifts to you, and please accept it without thinking it is too little. Homages from Hsuan-tsang."

Reply to Prajnadeva:

He also wrote a reply to the venerable Prajnadeva as the following:

"Bhiksu Hsuan-tsang of the great Kingdom of Tang begs to send his greetings to the Venerable Prajnadeva of the Mahabodhi Monastery. Since we parted, I have always been thinking of you, and as it is difficult to send you a letter, I could find no means to pay my respects to you. When Bhiksu Dharmarudha arrived he conveyed to me your kind letter, which I received with great delight. I have also received two rolls of fine white cotton cloth and one fascicle of eulogistic stanzas. These are great gifts indeed which I, being a man of little virtue, am unworthy to accept. The season is becoming warmer and I don't know how your health is since you wrote me that letter. I think life must be pleasant for you, since you well understand the theories of a hundred schools and the *Sutras* of the nine divisions. You established the banner of the right *Dharma* to convert people to Buddhism, and beat the drum of victory of vanquish boastful heretics. You are proud in the presence

of kings and nobles and your friends are all learned scholars. Being a man of ordinary ability, I am growing weak, and my remembrance of your virtues and my admiration for your benignity make me think of you all the more. When I was studying in India I had the opportunity to meet your Reverence, and in the meeting of Kanyakubja we had debated together to find out the truth in the presence of the kings and numerous followers of the different schools. It was unavoidable that there had been bitter arguments as one party holding the doctrines of Mahayanism, while the other party the teachings of Hinayanism. Truth was what was sought after, regardless of personal feelings. Thus I had probably offended you during the course of debate, but as soon as the meeting was over, all resentment was cleared immediately. Now the messenger still conveyed to me your apology for that event. How scrupulous you are! You are a good scholar of great eloquence and noble character. The water in the Anavatapta Lake is not comparable to the amount of your knowledge and a pure Mani-pearl cannot exceed the purity of your character. Being a man of high virtue, you are an example to your students, and I hope that you will exert yourself to spread the right *Dharma*. No doctrine is as perfect as Mahayana Buddhism and I regret that you did not have a deep faith in it. It is like those who are content with a sheep or deer cart but give up a bull carriage. One should appreciate crystal instead of a piece of glass. Learned scholar as you are, why are you so persistent in your biased views? This physical body of ours can never last long. It befits you to embrace the right views of Mahayana teaching at an earlier date, so that you will not repent at the moment of death. The messenger is now returning home and I am entrusting him with this letter with my respects to you. Attached is a small gift for you, and it is but a sign of my gratitude, quite inadequate to express my deep admiration of you. This I hope you will note. Formerly I had lost a horse-load of scriptures while I was crossing the Indus on my returning journey. Attached is a list of books, which I hope you will kindly send to me. The other things I am unable to relate in detail in this letter. With homage from Bhisku Hsuan-tsang.

BOOK VIII (‘*LIFE*’)

On the first day of the fifth month in the summer of the sixth year of Yung Hui (AD 655), the Master also translated the *Nyayadvaratataraka Sastra*

besides his regular work. He had previously translated the *Hetuvidya Sastra* while he was living in the Hung Fu Monastery. These two *Sastras* are of one volume each, being works of logic in explanation of the methods of argumentation and refutation by direct knowledge and inference.

BOOK IX (‘*LIFE*’)

As the Master studied strenuously while he was young and owing to the hardships of travelling over icy mountains and snowy ranges to the west, he suffered a kind of “cold disease.” During these paroxysms his heart would be affected. He was much troubled by his illness. For several years he depended on medicines for keeping himself in health.

While the Master was in the capital he had already translated the *Abhidharma-jnana-prasthana* in 30 volumes and had not yet completed the translation of the *Maha-vibhasa Sastra*.

BOOK X (‘*LIFE*’)

On the first day of the first month in the spring of the fifth year (AD 660), he started the translation of the *MahaPrajnaparamita Sutra.* The original Sanskrit text had a total number of 200,000 verses.

He ordered the Venerable Chia-shang to make a list of the *Sutras* and *Sastras* he had translated into Chinese, which amounted to a total number of 74 works in 1,335 volumes. It was also recorded that he had painted one thousand images of the Buddha and one thousand images of *Maitreya*, as well as a million statues of the Buddha. He had also copied the *VajracchedikaPrajnaparamita Sutra*, the *Bhaisajyaguru Sutra*, the *Sanmukhadharani Sutra* and some other *Sutras* each for one thousand copies. He had given alms to more than ten thousand Bhiksus as well as to more than ten thousand poor people, lighted hundreds and thousands of sacrificial lamps and redeemed the lives of tens of thousands of living creatures. When the list had been made he ordered Chia-shang to read it aloud, and he felt glad.

.

CHAPTER — 15

I-TSING

I-tsing, one of the three great Chinese pilgrims to India, was born in 635 AD in Fan-yang near Beijing, in the reign of Tai-tsung (627–649 AD). At the age of seven, he went to the teachers Shan-yu and Hui-hsi in a temple on the mountain Tai in Shan-tung. He was admitted to the Order (*Pravragya*) at the age of fourteen, and some years later developed a deep desire to travel to India, which was accomplished at the age of thirty-seven.

He was fully ordained as a monk at the age of twenty (654). His new teacher, Hui-hsi, impressed upon him the importance of holding firm to the Noble Precepts of the Buddha, and the fact that the teaching was becoming misinterpreted. This led I-tsing to study the *Vinaya* text exclusively for five years (654-658), followed by the larger *Sutras*. Encouraged by his teacher, he went to Eastern Wei (in Honan) to study Asanga's two *sastras* belonging to the *Abhidharma-pitaka*; to the Western Capital to study the *Abhidharma-kosa* and *Vidyamatrasiddhi* of Vasubandhu and Dharmapala respectively. At Ch'ang-an, he may have witnessed the 'noble enthusiasm of Yuan Chwang,' and the grand funeral accorded by the emperor as Yuan Chwang died during I-tsing's stay in the capital (664).

I-tsing left for India in AD 671, and arrived in Tamralipti at the mouth of the Hooghly in AD 673. In India, he studied Sanskrit grammar (*Sabdavidya*). While studying in Nalanda, the high seat of Buddhist learning, he collected nearly 400 Sanskrit texts, comprising 500,000 slokas, and procured a real plan of the Diamond Seat (*Vajrasana*) of the Buddha. On his return journey, he stopped for further study at Sribhoga (Sumatra) and translated Buddhist books in Sanskrit or Pali. From Sribhoga he sent home the present work[424] in AD 692, through the Chinese priest Ta-ts'in. Hence the title: '*Nan-hai-chi-kuei-nai-fa-ch'uan'* or '*A Record of the Inner Law sent home from the Southern Sea*.'[425] It is not certain when I-tsing reached Sribhoga and compiled his work, but as he used the dynastic name Chou adopted in AD 690 by the Usurper Queen (reigned AD 684–704), scholars believe his Record was most likely compiled within AD 690–692.

I-tsing returned home in AD 695 after nearly twenty-five years; he was honoured by the ruling empress, Wu-hou of the Chou dynasty. He immersed himself in interpreting Buddhist texts with some nine Indian priests, including Sikshananda and Isvara. He completed fifty-six translations in 230 volumes, AD 700–712. There are besides, five works of compilation, including the *Record* and biographical sketches of Chinese and Korean monks who visited India while he was there (*The Lives of Eminent Monks*). He died in AD 713, aged seventy-nine. His life and works were commended by Emperor Chung-tsung in the preface to the *Tripitaka Catalogue*.

I-tsing visited India to rectify the *Vinaya* rules of his time and refute incorrect beliefs of Chinese Buddhist schools. Hence his focus on the nitty-gritty of monastic discipline, though he sometimes noted facts of significance to students of history. I-tsing's work is critical in the study of the development of the Schools of the Chinese Vinaya, of which little is still known. The present work is an exclusive representation of the Mulasarvastivada School, one of the four chief *Nikayas* prevalent in India, though I-tsing also gives an interpretation of the divisions of Buddhist sects along with their general geographical locations. He relates the orthodox tradition of worship and ritual as he understood it. On the whole, however, among Buddhist pilgrims, I-tsing was poor in recording details of contemporary Indian society. We have selected passages we hope would interest the contemporary reader, based on the Japanese edition, the arrangement of which is more convenient. I-tsing's works as well as the whole canon were preserved in MS (manuscript form) only and not printed till AD 972.

INTRODUCTION

IV. …. According to the noble teaching and the principal customs actually carried on in India, I have carefully written the following articles which are forty in number, and have divided them into four books. This is called '*Nan-hai-chi-kuei-nai-fa-ch'uan*,' i.e. '*The Record of the Sacred Law, sent home from the Southern Sea*.' I am sending you with this another work of mine, '*Ta-t'ang-si-yu-ku-fa-kao-seng-ch'uan*,' i.e. '*Memoirs of Eminent Priests who visited India and Neighbouring Countries to search for the Law*

under the Great Tang Dynasty' (AD 618–907), and several *Sutras* and *Sastras*, in all, ten books.[426] I hope that the venerable priests with mind intent on the promulgation of their religion, without having any prejudice, will act with discrimination and in accordance with the teaching and practice of the Buddha, and that they will not disregard the weighty laws described in this work because they deem the author of no note…

If you read this Record of mine, you may, without moving one step, travel in all the five countries of India, and before you spend a minute you may become a mirror of the dark path for a thousand ages to come. Will you, I pray, read and examine carefully the *Tripitaka* and beat the Ocean of the Law, as it were, to stir up the four waves (all the people); and resting on the authority of the five *skandhas*, launch the ship of compassion to carry across the beings who are plunged into the six desires. Although I have received the personal direction from my teachers, and have fully examined the deep purport of our doctrine, I must, nevertheless, further deepen and expand my knowledge; for if I do not, I am afraid I shall be an object of ridicule in the 'eye of wisdom'…

All the things mentioned in this work are in accordance with the *Aryamulasarvastivadanikaya*, and should not be confounded with the teaching of other schools. The matters contained in this work resemble generally the *Vinaya* of the *Dasadhyaya* (Ten Readings).

There are three subdivisions[427] of the *Aryamulasarvasti-vadanikaya*:

1. The *Dharmagupta*: 2. The *Mahisasaka*; 3. The *Kasyapiya*.

These three do not prevail in India, except in the following places: Udyana, Kharakar, and Kustana, where there are some who practice the rules laid down in these schools.

The *Vinaya* of the so-called *Dasadhyaya* (though not unlike) does not belong to the *Aryamulasarvastivada* school.

CHAPTER IV DISTINCTION BETWEEN PURE AND IMPURE FOOD

I-tsing was meticulous in recording details of proper conduct for priests:

Among the priests and laymen in India, it is customary to distinguish between clean and unclean food. If but a mouthful of the food have been eaten, it becomes unclean (i.e., 'touched'); and the utensils in which food was put are not to be used again. As soon as the meal is finished, the utensils used are removed and piled up in one corner. All the remaining food is given to those who may legally eat such (e.g., birds); for it is very improper to keep the food for further use.

This is the custom among both rich and poor, and is not only a custom observed by us, but even by the Brahmans. It is said in several *Sastras*: 'It is considered to be mean not to use a tooth-wood, and not to wash the hands after evacuation, and not to distinguish between clean and unclean food.' How can we consider it seemly to use again the utensils that have already been touched, to preserve food remaining over in the kitchen, to keep in a jar the rice that has been left from a meal, or to put back the reminder of the soup in a pot? Nor is it right to eat next morning the soup and vegetables that have been left, or to partake later of the remaining cake or fruits…

If they neglect these points, any prayers or charms that they may have offered will have no efficacy, and any offering they may make will not be accepted by the Spirits…

Now the first and chief difference between India of the five regions and other nations is the peculiar distinction between purity and impurity.

Once upon a time when the Mongolians of the North sent men to India, the messengers were despised and ridiculed, as they did not wash themselves after evacuation, and preserved their food in a tray. This was not all; they were scorned and spoken ill of, as they sat together (*on the floor*) at a meal, with their feet straight out, and touching one another's, and they did not keep out of the neighbourhood of pigs and dogs, and did not use a tooth-brush. Therefore those who are practicing the Law of the Buddha ought to be very careful on these points. But in China the distinction of pure and impure food has never been recognised from ancient time.

CHAPTER VII THE MORNING INSPECTION OF WATER AS TO INSECTS

On the principal of respect for the humblest forms of life:

Water must be examined every morning. According as it is found in different places, *I.E.* in jars, in a well, in a pond, or in a river.

The means also of examining it differ. Early in the morning jar-water is first to be examined. After pouring about a handful of it, by inclining the jar, into a pure bronze cup, a ladle made of bronze, a conch-shell, or a plate of lacquer-work, pour it slowly on a brick. Or, by means of a wooden instrument made for this purpose, observe the water for some moments, shutting the mouth with the hand. It is likewise well to examine it in a basin or in a pot. Insects even as small as a hair-point must be protected. If any insects are found, return the water again into the jar, and wash the vessel with other water twice until no insects are left in it. If there is a river or a pond in the neighbourhood, take the jar there and throw away the water containing insects; then put in fresh filtered water. If there is a well, use its water, after filtering it, according to the usual manner…

The Indians use fine white cloth for straining water; and in China fine silk may be used, after having slightly boiled it with rice-cream; for small insects easily pass though the meshes of raw silk…

During the sixth or the seventh month [of the year] the insects are so minute, and different from what they are in the other seasons, that they can pass even through ten folds of raw silk.

Those who wish to protect life should try to set the insect free by some means or other. A plate-like tray may be used for the purpose, but the silk strainer is also very useful. The tray is generally made of copper, in India, in accordance with the rules laid down by the Buddha: one must not neglect these points…

As regards living creatures, an injury to them is a sin, and is prohibited by the Buddha…

It is this prohibition that is the most weighty of all, and an act of injury is placed at the head of the ten sins. One must not be neglectful of this. The filter is one of the six possessions necessary to the priests, and one cannot do without it. One should not go on a journey three or five Chinese miles without a filter. If a priest be aware of the fact that the residents in the temple where he is staying do not strain their water, he must not partake of food there. Even if the traveller die on his way from thirst[428] or hunger, such a deed is sufficient to be looked upon as a splendid example.

CHAPTER IX RULES ABOUT THE RECEPTION AT THE UPAVASATHA DAY

Buddha turns a demoness into the protector of children:

It is never customary to say a prayer before meals. The host, having cleansed his hands and feet, makes an offering to saints (images of *arhats*) at the upper end of the row of seats; then he distributes food to the priests. At the lowest end of the row an offering of food is made to the mother, Hariti.

At the former birth of this mother, she from some cause or other, made a vow to devour all babes at *Rajagriha*. In consequence of this wicked vow, she forfeited her life, and was reborn as a Yakshi; and gave birth to five hundred children. Every day she ate some babes at Rajagriha, and the people informed the Buddha of this fact. He took and concealed one of her own children, which she called Her Beloved Child. She sought for it from place to place, and at last happened to find it near the Buddha. 'Art thou so sorry,' said the World-honoured One to her, 'for thy lost child, thy beloved? Thou lamentest for only one lost out of five hundred; how much more grieved are those who have lost their only one or two children on account of thy cruel vow?' Soon converted by the Buddha, she received the five precepts and become an *Upasika*.[429] 'How shall my five hundred children subsist hereafter?' the new convert asked the Buddha. 'In every monastery,' replied the Buddha, 'where *Bhikshus* dwell, thy family shall partake of sufficient food, offered by them every day.' For this reason, the image of Hariti is found either in the porch or in a corner of the dining-hall of all Indian monasteries depicting her as holding a babe in her arms, and round her knees three or five children. Every day an abundant offering of food is made before this image. Hariti is one of the subjects of the four heavenly kings.[430] She has a power of giving wealth. If those who are childless on account of their bodily weakness (pray to her for children), making offerings of food, their wish is always fulfilled. A full account of her is given in the *Vinaya*;[431] so I have only given it in brief. The portrait of 'the

demon mother of the children' (*Kuei-tze-mu*) has already been found in China.

The miraculous power of Mahakala in the monasteries:

There is likewise in great monasteries in India, at the side of a pillar in the kitchen, or before the porch, a figure of a deity carved in wood, two or three feet high, holding a golden bag, and seated on a small chair, with one foot hanging down towards the ground. Being always wiped with oil its countenance is blackened, and the deity is called *Mahakala* or the great black deity. The ancient tradition asserts that he belonged to the beings (in the heaven) of the Great god (*Mahesvara*). He naturally loves the Three Jewels, and protects the five assemblies[432] from misfortune. Those who offer prayers to him have their desires fulfilled. At meal-times those who serve in the kitchen offer light and incense, and arrange all kinds of prepared food before the deity. I once visited the *Pan-da-na* monastery (Bandhana, in Kusinagar), a spot where the great *Nirvana* was preached (by Buddha). There, usually more than a hundred monks dine. In spring and autumn, the best seasons for pilgrimages, the monastery is sometimes unexpectedly visited by a multitude (of travellers). Once five hundred priests suddenly arrived there, about midday. There was no time to prepare food for them exactly before noon. The managing priests said to the cooks: 'How shall we provide for this sudden increase?' An old woman, the mother of a monastic servant, replied: 'Be not perplexed, it is quite a usual occurrence.' Immediately she burnt abundant incense, and offered food before the black deity; and invoked him saying: 'Though the Great Sage has gone to *Nirvana* yet beings like thyself still exist. Now (a multitude of) priests from every quarter has arrived here to worship the holy spot. Let not our food be deficient for supplying them; for this is within thy power. May thou observe the time.'

Then all the priests were asked to take seats. The food, provided for only the priests in residence at the monastery, when supplied was sufficient for that great multitude of priests, and there was as much remaining over as usual. All shouted 'Good!' and applauded the power of that deity. I myself went there to worship the spot; consequently I saw the image of that black deity before which abundant offerings of food were made. I asked the

reason, and the above account was related to me. In China the image of that deity has often been found in the districts of Kiang-nan, though not in Huai-poh. Those who ask him (for a boon) find their wishes fulfilled. The efficacy of that deity is undeniable. The Naga (snake) Mahamukilinda[433] of the Mahabodhi monastery (near Gaya) has also a similar miraculous power.

The distances of India:

As to the five countries of India, their boundaries are wide and remote; roughly speaking, the distance from Central India to the limit in each direction (east, west, south, and north) is about 400 *yoganas*,[434] the remote frontier not being counted in this measurement. Although I, myself, did not see all these parts of India, I could nevertheless ascertain anything by careful inquiry.

Food preparations:

All food, both for eating and chewing, is excellently prepared in various ways. In the north, wheat-flour is abundant; in the western district, baked flour (rice, barley) is used above all; in Magadha wheat-flour is scarce, but rice is plentiful: and the southern frontier and the eastern border-land have similar products to those of Magadha.

Abundance of food:

Ghee, oil, milk, and cream are found everywhere. Such things as cakes and fruit are so abundant that it is difficult to enumerate them here. Even laymen rarely have the taste of grease or flesh. Most of the countries have the rice which is not glutinous in abundance; millet is rare, and glutinous millet is not found at all. There are sweet melons; sugar-canes and tubers are abundant, but edible mallows are very scarce. Wan-ching (a kind of turnip) grows in sufficient quantities; there are two kinds of this, one with a white seed, the other with a black seed. This has recently become known as *Chieh-tze* (mustard seed) in China. Oil is extracted from it and used for flavouring purposes; this is done in all countries. In eating leaves of it as a vegetable will find them of the same taste as Wan-ching. But the root is hard, not like the Chinese turnip. The seed is somewhat larger and can no

longer be considered ‘mustard seed.’ The change in the growth of this plant is considered to be something like the change of an orange-tree into a bramble when brought north of the Yang-tze River.

Indian abstinence from onions:

When I was in the Nalanda monastery, I discussed this point with the *Dhyana* master Wu-hing[435], but we were doubtful still and could not exactly distinguish one from the other. None of the people of all the five parts of India eat any kind of onions, or raw vegetables, and therefore they do not suffer from indigestion; the stomach and the intestines are healthy, and there is no trouble in their becoming hard and aching.

Entertainment on a fast day:

In the ten islands of the Southern Sea, the entertainment on the fast-day is made on a grander scale. On the first day the host prepares a *Pin-lang* nut (arecanut), fragrant oil prepared from *Fu-tzu* (*mustaka*, *Cyperus rotundus*), and a small quantity of crushed rice placed on a leaf in a plate; these three items being arranged on a large tablet are covered with a white cloth, water is poured out and kept in a golden jar, and the ground in front of this tablet is sprinkled with water. After these have been prepared, the priests are invited. In the forenoon of the last day, the priests are asked to anoint their bodies and wash and bathe. When the horse-hour (midday) of the second day has passed, a holy image is conveyed (from the monastery) on a carriage or on a palanquin, accompanied by a multitude of priests and laymen, playing or striking drums and musical instruments, making offerings of incense and flowers, and taking banners which shine in the sun, - in this manner it is carried to the courtyard of the house. Under a canopy amply spread, the image of gold or bronze, brilliant and beautifully decorated, is anointed with some aromatic paste, and then put in a clean basin. It is bathed by all those present with perfumed water (*gandhodaka*). After being wiped with a scented cloth, it is carried into the principal hall of the house, where it is received amidst rich offerings of lights and incense, while hymns of praise are sung. Then the priest first in rank (*Sthavira*) recites the *Danagatha* for the host to declare the merit of a religious feast with regard to the future life. Then the priests are led outside the house to

wash their hands and rinse their mouths, and, after this, sugar-water and *Pin-lang* fruits are offered to them in sufficient quantity; then they withdraw from the house. In the forenoon of the third day, the host, going to the monastery, announces to the priests: 'It is the time'. They, after bathing, come to the festal house. This time too the image is set up, and the ceremony of bathing it is held more briefly. But the offerings of flowers and incense and music are twice as grand as on the previous morning. Numerous offerings are arranged orderly before the image, and on both sides of it five or ten girls stand in array; and also some boys, according to convenience. Every one of them either carries an incense-burner, or holds a golden water jar, or takes a lamp or some beautiful flowers, or a white fly-flapper. People bring and offer all kinds of toilet articles, mirrors, mirror-cases, and the like, before the image of the Buddha. 'For what purpose are you doing this?' I once inquired of them. 'Here is the field, and we sow our seed of merit,' they replied; 'if we do not make offerings now, how can we reap our future rewards?' It may be said reasonably that such is also a good action. Next, one of the priests, on being requested, kneels down before the image, and recites hymns in praise of the Buddha's virtues. After this two other priests, being requested, sitting near the image, read a short *Sutra* of a page or a leaf. On such an occasion, they sometimes consecrate idols and mark the eyeballs of them, in order to obtain the best reward of happiness. Now the priests withdraw at pleasure to one side of the room; and, folding up their *kashayas* (yellow robes), and binding their two corners at the breasts, they wash their hands: then they sit down to eat.

As to the processes such as strewing the ground with cow-dung, examining water, or washing the feet, and as to the manner of taking or serving food, all these particulars are much the same as in India, with this addition, that in the islands of the Southern Sea the priests take the three kinds of pure meat[436] also. They frequently use leaves sewn together for plates as capacious as half a mat (on which they sit); and rice-cakes made of one or two *Shang* (a *Shang*=about 2½ qt.) of non-glutinous grains, are prepared in such a plate. Having made similar vessels capable of one or two *Shang* of grains, they bring them and offer them before the priests. Then twenty or thirty kinds of food are served to them. This, however, is the case of an entertainment by comparatively poor people. If it be by kings or rich

men, bronze-plates, bronze-bowls, and leafed plates as large as a mat are distributed; and the number of the several kinds of food and drink amounts to a hundred. Kings on such an occasion disregard their own high dignity, and call themselves servants, and help the priests to the food with every sign of respect. The priests have to receive as much food as is given, but never to resist it, however excessive it may be. If they have only food just enough to satisfy, the host would not be pleased; for he only feels satisfied when seeing food served over-abundantly. Four or five *Shang* of boiled rice and cakes in two or three plates are given to each. The relations and the neighbours of the host help the entertainment, bring with them several kinds of food, such as rice-cakes, boiled rice, vegetables for soup, &c. Usually the remainder of the food (i.e. *Ukkhishtabhogana)* given to one person may satisfy three persons; but in case of a richer entertainment, it could not be eaten up even by ten men. The food remaining over is left to the priests, who order their servants to carry it to the monastery.

Comparison with fast-breaking ceremony in China:

The ceremony of the *Upavasatha*-day reception in China differs from that of India. In China the host gathers the food left over, and the guests are not allowed to take it away. The priests may act according to the custom of their time, being self-contented and free from blame; thus the host's intention of gifts is by no means incomplete. But if the host (i.e. *Danapati*) has made up his mind not to gather the food remaining, and asks the guests to take it away, one may act as best suits the circumstance.

Indulgence towards the monks:

Now perfume paste, about the size of a fruit of the *Wu*-tree (Dryandra-seeds), is given to each of them, and they rub their hands with it in order to make them fragrant and clean. Next, some *Pin-lang* fruit and nutmegs, mixed with cloves and *Baros*-camphor, are distributed: in eating these they get the mouth fragrant, the food digested and the phlegm removed. These fragrant medicinal things and the others are given to the priests, after they have been washed with pure water, and wrapped in leaves.

Now the host, approaching the priest first in rank, or standing before the reciter (of the *Sutras*), pours water from the beaked mouth of a jar (*Kundi*)

into a basin, so that water comes out incessantly like a slender stick of copper. The priest mutters the *Danagathas*, while taking flowers, and receiving with them the flowing water. First, verses from the words of the Buddha are recited, and then those composed by other persons. The number of the verses may be many or few according to the reciter's will, and according to circumstances. Then the priests, calling out the host's name, prays for happiness upon him, and wishes to transfer the happy reward of good actions done at present to those already dead, to the sovereigns, as well as to the snakes (*Nagas*) and spirits; and prayers, saying, 'May there be good harvests in the country, happy be the people and other creatures; may the noble teaching of the Sakya be everlasting.' I have translated these *Gathas* as seen elsewhere. These are blessings given by the World-honoured himself, who always said the *Dakshinagathas* after the meal. This (*Dakshina*) means a gift offered, while *Dakshiniya* is one worthy to be honoured with gifts. The Holy One, therefore, commands us that, after the meal, we should recite one or two *Danagathas* in order to reward the host's hospitality; and if we neglect it, we are against the holy laws, and are not worthy to consume the food offered. The rule of begging the remaining food is sometimes carried out after the feasts.

I-tsing on the truth of permanence:

… One should never be ignorant of the *Tripitaka*, nor be perplexed in the teaching and principles contained in it. Some have committed sins as numerous as the grains of sand of the Ganges, yet they say that they have realized the state of *Bodhi* (true wisdom). *Bodhi* means enlightenment, and in it all the snares of passion are destroyed. The state in which neither birth nor death is found is the true permanence. How can we thoughtlessly say, as some do, while living in the sea of trouble, that we live in the Land of Bliss (*Sukhavati*)?

One who wishes to realise the truth of permanence should observe the moral precepts in purity. One should guard against a small defect which results, just as a small escape of air from the life-belt may result in loss of life; and one should prevent a great offence that makes one's life useless, just as a needle the eye of which has been broken off becomes useless. First and foremost of all the great offences are those in food and clothing. Final

Liberation (*Moksha*) will not be very far from one who follows the teaching of the Buddha, but transmigration will go on for evermore for one who disregards the noble words. I have thus far mentioned the lawful practices and briefly described the former examples, all resting on noble authorities, but not on opinions of my own. I hope that I do not offend you in my straightforward statements, and that my Record will help towards the solution of any doubts that you may have. If I did not exactly state the good and bad practices (of India and China), who would ever know what is good or bad in the two?

CHAPTER X NECESSARY FOOD AND CLOTHING

I-tsing was very meticulous about the proper forms of the *dhamma*:

It may be observed that the earthily body which support is only maintained by food and clothing, while the spiritual knowledge that is beyond the bond of births can only be increased by means of the principle of nothingness. If the use of food and clothing be against proper rules, every step will involve some crime; while tranquilisation of the mind without moral regulation will cause more and more perplexity as one goes on meditating.

Therefore those who seek for Final Liberation (*Moksha*) should use food and clothing according to the noble words of the Buddha, and those who practice the principle of meditation should follow the teaching of former sages in tranquilising their thoughts. Watch over the life here below, which is but a dungeon for the beings that have gone astray, but look eagerly for the shore of *Nirvana*, which is the open gate of enlightenment and quietude. The ship of the Law should be manned ready for the sea of suffering, and the lamp of wisdom should be held up during the long period of darkness. There are express laws in the *Vinaya* text on the observance and neglect that are evident in the light of the regulations of clothing and the rules of eating and drinking, so that even beginners in the study can judge the nature of an offence.

Each individual must himself be responsible for the results of his own practices, whether good or bad, and there is no need of argument here. But

there are some who are, as teachers of the students, grossly offending against the *Vinaya* rules; there are others who say that the usage of the world, even if against the Buddha's discipline, does not involve any guilt. Some understand that the Buddha was born in India, and Indian *Bhikshus* follow Indian customs, while we ourselves live in China, and, as Chinese monks, we follow Chinese manners. 'How can we,' they argue, 'reject the elegant dress of the Divine Land (China) to receive the peculiar style of garments of India?' For the sake of those who adhere to this view I here roughly state my opinion, founded on the authority of the *Vinaya*.

The regulations of clothing are the most important for the life of a homeless priest (*Pravragya*), and I should therefore mention here in detail the style of garments, because these cannot be neglected or curtailed.

Use of silk and the necessity for violence to maintain life:

… As to fine and rough silk, these are allowed by the Buddha. What is the use of laying down rules for a strict prohibition of silk? The prohibition was laid down by some one; though intended for lessening complication, such a rule increases it. The four *Nikayas* of the *Vinaya* of all the five parts of India use (a silk garment). Why should we reject the silk that is easy to be obtained, and seek the fine linen that is difficult to be procured? Is not this the greatest hindrance to religion? Such a rule may be classed with the forcible prohibitions that have never been laid down (by Buddha).

The result is that curious students of the *Vinaya* increase their self-conceit and cast slight upon others (using silk). People who are disinterested and less avaricious are much ashamed of such, and say: 'How is it that they regard self-denial as a help to religion?' but if (refusal of silk) comes from the highest motive of pity, because silk is manufactured by injuring life, it is quite reasonable that they should avoid the use of silk to exercise compassion on animate beings. Let it be so; the cloth one wears, and the food one eats, mostly come from an injury to life. The earthworms (that one may tread on while walking) are never thought of; why should the silkworm alone be looked after? If one attempts to protect every being, there will be no means of maintaining oneself, and one has to give up life without reason. A proper consideration shows us that such a practice is not right.

There are some who do not eat *ghee* or cream, do not wear leather boots, and do not put on any silk or cotton. All these are the same class of people as are mentioned above.

On killing - no guilt incurred on unintentional killing:

Now as to killing. If a life be destroyed intentionally, a result of this action (*Karma*) will be expected; but if not intentionally, no guilt will be incurred, according to the Buddha's words. The three kinds of meat that are pure are ordained as meats that can be eaten without incurring guilt. If the spirit of this rule be disregarded, it will involve some offence though small.

On eating meat without guilt:

(In eating the three kinds of meat), we have no intention of killing, and therefore we have a cause or reason that makes our eating of flesh guiltless. (Such meat is as pure) as any other thing which we receive as a gift, and therefore we have an example (or instance) which helps us in making our reasoning very clear. When the cause and instance (of our eating flesh) are so clear and faultless, then the doctrine we advocate becomes also clear and firm. Now the three branches of reasoning have been as clearly constructed as above and besides, we have the golden words of the Buddha to the same effect. What then is the use of arguing any further?

On gifts:

Such deeds as begging personally for cocoons containing silkworms, or witnessing the killing of the insects, are not permissible, even to a layman, much less to those whose hearts aspire to final emancipation. These deeds, when looked at in this light, prove themselves to be quite impermissible. But supposing a donor (*Danapati*) should bring and present (*silk cloth*), then a priest should utter the word '*Anumata'* ('approved') and accept the gift in order to have a means of supporting his body while he cultivates the virtues; no guilt will be incurred by so doing.

On sharing the harvest with cultivators:

According to the teaching of the *Vinaya*, when a cornfield is cultivated by the *Sangha*, a share in the product is to be given to the monastic servants or some other families by whom the actual tilling has been done. Every product should be divided into six parts, and one-sixth should be levied by the *Sangha*; the *Sangha* has to provide the bulls as well as the ground for cultivation, while the *Sangha* is responsible for nothing else. Sometimes the division of the products should be modified according to the seasons.

Most of the monasteries in the West follow the above custom, but there are some who are very avaricious and do not divide the produce, but the priests themselves give out the work to servants, male and female, and see that the farming is properly done.

Those who observe the moral precepts do not eat food given by such persons, for it is thought that such priests themselves plan out the work and support themselves by a 'wrong livelihood;' because in urging on hired servants by force, one is apt to become passionate, the seeds may be broken, and insects be much injured while the soil is tilled. One's daily food does not exceed one *Shang*, and who can endure hundreds of sins incurred while striving to get even that?

Problems with agriculture:

Hence an honest man hates the cumbersome work of a farmer, and permanently keeps away from it (rejects it) carrying with him a pot and a bowl.

Such a man sits still in a place in a quiet forest and takes pleasure in company with birds and deer; being free from the noisy pursuit of fame and profit he practices with a view to the perfect quietude of *Nirvana*. According to the *Vinaya* it is allowable for a *Bhikshu* to try to gain profits on behalf of the Brotherhood (*Sangha*), but tilling land and injuring life are not permitted in the Buddha's teaching, for there is nothing so great in injuring insects and hindering proper action as agriculture.

When I for the first time visited Tamralipti, I saw in a square outside the monastery some of its tenants who, having entered there, divided some vegetables into three portions, and having presented one of the three to the priests, retired from thence, taking the other portions with them. I could not understand what they did, and asked of the venerable Tashang Tang

(Mahayana Pradipa) what was the motive. He replied: 'The priests in this monastery are mostly observers of the precepts. As cultivation by the priests themselves is prohibited by the great Sage, they suffer their taxable lands to be cultivated by others freely, and partake of only a portion of the products. Thus they live their just life, avoiding worldly affairs, and free from the faults of destroying lives by ploughing and watering fields.'

Norms governing meetings between nuns and monks:

… The following things also came under my notice. When the nuns were going to the priests in the monastery, they proceeded thither after having announced (the purpose of assembly). The priests, when they had to go to the apartments of the nuns, went there after having made an inquiry. They (nuns) walked together in a company of two, if it was away from their monastery; but when they had to go to a layman's house for some necessary cause, they went thither in a company of four…

Proprieties observed by the monk Rahula-*mitra*:

Whenever women entered into the monastery, they never proceeded to the apartments (of the priests), but spoke with them in a corridor for a moment, and then retired. At that time there was a *Bhikshu* named *A-ra-hu-la-mi-ta-ra* (Rahula-*mitra*) in that monastery. He was then about thirty years old; his conduct was very excellent and his fame was exceedingly great. Every day he read over the *Ratnakutasutra* which contains 700 verses. He was not only versed in the three collections of the scriptures, but also thoroughly conversant with the secular literature on the four sciences. He was honoured as the head of the priests in the eastern districts of India. Since his ordination he never had spoken with women face to face, except when his mother or sister came to him, whom he saw outside (his room). Once I asked him why he behaved thus, as such is not holy law. He replied: 'I am naturally full of worldly attachment, and without doing thus, I cannot stop its source. Although we are not prohibited (to speak with women) by the Holy One, it may be right (to keep them off), if it is meant to prevent our evil desires.'

Honours bestowed upon learned monks:

The assembly assigned to venerable priests, if very learned, and also to those who thoroughly studied one of the three collections, some of the best rooms (of the monastery) and servants. When such men gave daily lectures, they were freed from the business imposed on the monastics. When they went out, they could ride in sedan-chairs, but not on horse-back. Any strange priest who arrived at the monastery was treated by the assembly with the best of their food for five days, during which he was desired to take rest from his fatigue. But after these days he was treated as a common monastic. If he was a man of good character, the assembly requested him to reside with them, and supplied him with bed-gear as suited to his rank. But if he was not learned, he was regarded as a mere priest; and, if he, on the contrary, was very learned, he was treated as stated above. Then his name was written down on the register of the names of the resident priests. Then he was just the same as the old residents. Whenever a layman came there with a good inclination, his motive was thoroughly inquired into, and if it was his intention to become a priest, he was first shaved. Thenceforth his name had no concern with the register of the state; for there was a register book of the assembly (on which his name was written). If he afterwards violated the laws and failed in his religious performances, he was expelled from the monastery without sounding the *Ghanta* (bell). On account of the priest's mutual confession, their faults were prevented before their growth.

I-tsing appreciates the conduct of monks:

When I have observed all these things, I said to myself with emotion: 'When I was at home, I thought myself to be versed in the *Vinaya*, and little imagined that one day, coming here, I should prove myself really one ignorant (of the subject). Had I not come to the West, how could I ever have witnessed such correct manners as these!"

Of these above described some are the monastic rites, while others are specially made for the practice of self-denial; and all the rest are found in the *Vinaya*, and most important to be carried out in this remote period (from Buddha's time). All these form the ritual of the monastery *Bha-ra-ha* at Tamralipti.

Wealth of Nalanda monastery:

The rites of the monastery Nalanda are still more strict. Consequently the number of the residents is great and exceeds 3000. The lands in its possession contain more than 200 villages. They have been bestowed by kings of many generations. Thus the prosperity of the religion continues ever, owing to nothing but (the fact that) the *Vinaya* (is being strictly carried out).

CHAPTER XX BATHING AT PROPER TIMES

Climate and land of India:

Now I shall describe the manner of bathing. Bathing in India is different from that in China. The weather is moderate in all seasons, somewhat different from other districts. There are flowers and fruits always, even in the twelfth month. Snow and ice are unknown. There is frost, but slightly. Though it is hot (in certain seasons), yet the heat is not intense; and even in the warmest season people do not suffer from 'prickly heat'. When it is very cold, they have not chapped feet, for they wash and bathe frequently, and think much about the purity of the body. In their daily life they do not eat without having first washed.

Importance and abundance of pools:

Water is exceedingly abundant in the pools everywhere. It is considered meritorious to dig ponds. If we go but one *yogana*, we see twenty or thirty bathing-places; and they vary in size, some being one *mou* (about 733 ½ square yards), others five *mou*. On all sides of a pond *Sala*-trees are planted, which grow to the height of about forty or fifty feet. All these pools are fed by rain-water, and are as clear as a pure river. Near every one of the eight *Kaityas*[437] there is a pool in which the World-honoured One used to bathe. The water in these pools is very pure, different from that in others.

There are more than ten great pools near the Nalanda monastery, and there every morning a *ghanti* is sounded to remind the priests of the bathing-hour. Every one brings a bathing-sheet with him. Sometimes a hundred, sometimes a thousand (priests) leave the monastery together, and proceed in all directions towards these pools, where all of them take a bath.

The World-honoured One taught how to build a bath-room, to construct a brick pond in an open place, and to make a medical bath in order to cure a disease. Sometimes he ordained the whole body to be anointed with oil, sometimes the feet to be rubbed with oil every night, or the head every morning; for such a practice is very good for maintaining clear eyesight and keeping off the cold.

CHAPTER XXV BEHAVIOUR BETWEEN TEACHER AND PUPIL

Chinese names for India:

Some say that *Indu* means the moon, and the Chinese name for India, *I.E. Indu*, is derived from it; although it may mean this, it is, nevertheless, not the common name. As to the Indian name for the Great *Chou* (China), ie. *Kina*, it is only a name and has no special meaning.

Further we ought to note that the whole country comprising the five parts of India is called the 'kingdom of the Brahmans' (*Brahmarashtra*).

Suli on the north is all called the Mongolian Frontier (or Border). One should not confuse them nor call all of them by one name.

CHAPTER XXVII ON SYMPTOMS OF BODILY ILLNESS

Honouring of physicians and merchants:

Indians greatly honour physicians and much esteem merchants, for they do not injure life, and they give relief to others as well as benefit themselves.

Medical herbs in India:

Further we must notice that the medical herbs in India are not the same as those of China (Eastern Hsia); those which exist in one country are not found in the other, and the materials used cannot be treated in the same way. For instance, the ginseng (*Aralia cordata*), the *Yuan-chih* (*Polygala sibirica*), the tubers of aconite (*Aconitum Fischeri*), the *Fu-tsze hsin*

(*Asarum Sieboldii*), and such like are the best herbs in the Divine Land (China) and are never found in the West (India). *Haritaka* (yellow *myrobalan*) is abundant in India; in North (India) there is sometimes the *Yu-chin-hsiang* (saffron), and the *A-wei* (assafoetida) is abundant in the western limit of India. The *Baros* camphor is found a little in the islands of the Southern Sea, and all the three kinds of cardamoms are found in *Dvara* (-*vati*); two kinds of cloves grow in Pulo Condore. Only the herbs above mentioned are used in India in the same way (as in China); all other herbs are not worth gathering.

CHAPTER XXVIII RULES ON GIVING MEDICINE

On Chinese medicine:

… There are in China more than four hundred kinds of herbs, stones, stalks, and roots, most of which are excellent and rare in colour and taste, and very fragrant in their smell; thereby we can cure any disease and control the temper. In the healing arts of acupuncture and cautery and the skill of feeling the pulse China has never been superseded by any country of *Gambudvipa* (India); the medicament of prolonging life is only found in China. Our hills are connected with the Himalaya, and our mountains are a continuation of the Gandhamadana;[438] all sorts of things strange and precious are found there in abundance. From the character of men and the quality of things, China is called the 'Divine Land.' Is there any one, in the five parts of India, who does not admire China? All within the four seas respectfully receive the command. They (Indians) say that Mangusri[439] is at present living in that country (China). When they hear that one is a priest of the *Deva-putra*, all pay great honour and respect, wherever one goes. *Deva* means 'heaven' and *putra* 'son', the priest of the *Deva-putra* is more fully 'One who has come from the place where dwells the Son of Heaven of *Kina* (China).'

Differences in food habits of China and India:

In China, people of the present time eat fish and vegetables mostly uncooked; no Indians do this. All vegetables are to be well cooked and to be eaten after mixing with the assafoetida, clarified butter, oil, or any spice.

People (in India) do not eat any kind of onions. I was tempted and ate them sometimes, but they cause pain while taking a religious fast and injure the belly, besides spoiling the eyesight and increasing disease, and causing the body to become more and more weak. This is why Indians do not eat them.

CHAPTER XXIX HURTFUL MEDICAL TREATMENT MUST NOT BE PRACTICED

Cow products as medicine:

Feces and urine are permitted to be used as medicine in the *Vinaya*, but these are the dung of a calf and urine of a cow.[440]

CHAPTER XXXII THE CEREMONY OF CHANTING

Praising the virtues of Buddha in India; chanting names in China:

The custom of worshipping the Buddha by repeating his names has been known in the Divine Land as it has been handed down from olden times, but the custom of praising the Buddha by reciting his virtues has not been in practice. (The latter is more important than the former), because, in fact, to hear his names only does not help us to realise the superiority of his wisdom; whilst in reciting his virtues in descriptive hymns, we may understand how great his virtues are. In the West (India) priests perform the worship of a *Kaitya* and the ordinary service late in the afternoon or at the evening twilight.

The hymns of Matriketa:

In India numerous hymns of praise to be sung at worship have been most carefully handed down, for every talented man of letters has praised in verse whatever person he deemed most worthy of worship. Such a man was

the venerable Matriketa, who, by his great literary talent and virtues excelled all learned men of his age. The following story is told of him. While the Buddha was living, he was once, while instructing his followers, wandering in a wood among the people. A nightingale in the wood, seeing the Buddha, majestic as a gold mountain, adorned by his perfect signs, began to utter its melodious notes, as if it sang in praise of him. The Buddha, looking back to his disciples, said: 'The bird, transported with joy at sight of me, unconsciously utters its melodious notes. On account of this good deed, after my Departure (*Nirvana*) this bird shall be born in human form, and named Matriketa; and he shall praise my virtues with true appreciation.' Previously, as a follower of another religion, when born as man, Matriketa had been an ascetic, and had worshipped Mahesvardeva. When a worshipper of this deity, he had composed hymns in his praise. But on becoming acquainted with the fact that his birth had been foretold, he became a convert to Buddhism, robed in colour, and free from worldly cares. He mostly engaged himself in praising and glorifying the Buddha, repented of his past sins, and was desirous henceforward of following the Buddha's good example, regretting that he could not see the Great Teacher himself, but his image only. In fulfilment of the above prediction (*Vyakarana*), he wrote hymns in praise of the Buddha's virtues to the greatest extent of his literary powers.

He composed first a hymn consisting of four hundred *slokas*, and afterwards another of one hundred and fifty. He treats generally of the Six *Paramitas*, and expounds all the excellent qualities of the Buddha, the World-honoured One. These charming compositions are equal in beauty to the heavenly flowers, and the high principles which they contain rival in dignity the lofty peaks of a mountain. Consequently in India all who compose hymns imitate his style, considering him the father of literature. Even men like the Bodhisattvas Asanga and Vasubandhu admired him greatly.

Throughout India every one who becomes a monk is taught Matriketa's two hymns as soon as he can recite the five and ten precepts (*Sila*).

This course is adopted by both the Mahayana and Hinayana schools. There are six reasons for this. Firstly, these hymns enable us to know the Buddha's great and profound virtues. Secondly, they show us how to compose verses. Thirdly, they ensure purity of language (cause the tongue

to be pure). Fourthly, the chest is expanded in singing them. Fifthly, by reciting them nervousness in an assembly is overcome. Sixthly, by their use life is prolonged, free from disease. After one is able to recite them, one proceeds to learn other *Sutras*. But these beautiful literary productions have not as yet been brought to China. There are many who have written commentaries on them, nor are the imitations of them few. Bodhisattva Gina (Jina) himself composed such an imitation. He added one verse before each of the one hundred and fifty verses, so that they became altogether three hundred verses, called the 'mixed' hymns (probably *Samyukta-prasamsa*). A celebrated priest of the Deer Park, Sakyadeva by name, again added one verse to each of Gina's, and consequently they amounted to four hundred and fifty verses (*slokas*), called the 'Doubly Mixed' hymns.

All those who compose religious poems take these for their patterns. Bodhisattva Nagarguna (Nagarjuna) wrote an epistle in verse which is called the *Suhrillekha*, meaning 'Letter to an intimate friend;' it was dedicated to his old *Danapati*, named *Gi-in-ta-ka* (Gateka)[441] a king in a great country in Southern India, who was styled *So-to-pho-han-na* (Satavahana). The beauty of the writing is striking, and his exhortations as to the right way are earnest. His kindness excels that of kinship, and the purport of the epistle is indeed manifold. We should, he writes, respect and believe the Three Honourable Ones (*Triratna*, Tibetan *Suhrillekha*, verse 4), and support our fathers and mothers (verse 9). We should kept the precepts (*Sila*, verse II), and avoid committing sinful deeds (verses 10-12).

On the Jataka stories:

There is another work of a similar character called Gatakamala. *Gataka* means 'previous births,' and *mala* 'garland'; the idea being that the stories of the difficult deeds accomplished in the former lives of the Bodhisattva (later the Buddha) are strung together in one place.

Siladitya and the poems on Buddha:

The object of composing the Birth-stories in verse is to teach the doctrine of universal salvation in a beautiful style, agreeable to the popular mind and attractive to readers. Once king Siladitya (of Kanauj), who was exceedingly fond of literature, commanded, saying: 'Ye who are fond of poetry, bring

and show me some pieces of your own tomorrow morning.' When he had collected them, they amounted to five hundred bundles, and, on being examined, it was found that most of them were *Gatakamalas*. From this fact one judges that Gatakamala is the most beautiful (favourite) theme for laudatory poems...

King Siladitya versified the story of the Bodhisattva Gimutavahana (Ch. 'Cloud-borne'), who surrendered himself in place of a *Naga*. This version was set to music. He had it performed by a band accompanied by dancing and acting, and thus popularized it in his time. Mahasattva Kandra ('Moon-official,' probably Candradasa), a learned man in Eastern India, composed a poetical song about the prince Visvantara[442] (Chinese, *Pi-yu-an-ta-ra*), hitherto known as Sudana, and people all sing and dance to it throughout the five countries of India.

Asvaghosha's poems:

Asvaghosha also wrote some poetical songs and the *Sutralankarasastra*. He also composed the *Buddhakaritakavya* ('Verses on the Buddha's career'). This extensive work, if translated, would consist of more than ten volumes. It relates the Tathagata's chief doctrines and works during his life, from the period when he was still in the royal palace till his last hour under the avenue of *Sala*-trees:- thus all the events are told in a poem.

It is widely read or sung throughout the five divisions of India, and the countries of the Southern Sea. He clothes manifold meanings and ideas in a few words, which rejoice the heart of the reader so that he never feels tired from reading the poem. Besides, it should be counted as meritorious of one to read this book, inasmuch as it contains the noble doctrines given in a concise form. I am sending to you the 'Hymn in one hundred and fifty slokas' and the 'Epistle of Nagarguna' (*Suhrillekha*), both translated for special objects, trusting that those who like praise-songs will often practice and recite them.

CHAPTER XXXIV THE METHOD OF LEARNING IN THE WEST

IX. The Pei-na

On the Brahmins, Vedas and learning:

The Brahmans are regarded throughout the five parts of India as the most honourable (caste). They do not, when they meet in a place, associate with the other three castes, and the mixed classes of the people have still less intercourse with them. The scriptures they revere are the four *Vedas*, containing about 100,000 verses; '*Veda'* hitherto was wrongly transcribed by the Chinese characters '*Wei-t'o'*; the meaning of the word is 'clear understanding' or 'knowledge'. The *Vedas* have been handed down from mouth to mouth, not transcribed on paper or leaves. In every generation there exist some intelligent Brahmans who can recite the 100,000 verses. In India there are two traditional ways by which one can attain to great intellectual power. Firstly, by repeatedly committing to memory the intellect is developed; secondly, the alphabet fixes one's ideas. By this way, after a practice of ten days or a month, a student feels his thoughts rise like a fountain, and can commit to memory whatever he has once heard [not requiring to be told twice]. This is far from being a myth, for I myself have met such men.

I-tsing meets a great sage:

In Eastern India there lived a great man (*Mahasattva*) named Kandra (*Candra*), being like a Bodhisattva, endowed with great talent. This man was still alive when I, I-tsing, visited that country. One day a person asked him: 'Which is the more injurious, temptation or poison?' He at once answered: 'There is indeed a great difference between the two; poison is injurious only when it is swallowed; whilst the other destroys one's intellect when only contemplated.'

Indian monks who visited China:

Kasyapa-matanga and Dharmaraksha[443] preached good tiding in the eastern capital Lo (Honan-fu); the fame of Paramartha[444] reached even to the Southern Ocean (Nanking) and the venerable Kumaragiva[445] supplied a virtuous pattern to the foreign land (China). Afterwards the Bhadanta Hiuen Thsang followed out his professional career in his own country. In this way,

both in the past and present, have teachers spread far and wide the light of Buddhism.

To those who learn the doctrines of ‘existence’ and ‘non-existence’ the *Tripitaka* itself will be their Master, while for those who practice the *Dhyana* (meditation) and *Pragna* (wisdom) the seven *Bodhi-angas*[446] will be a guide.

Distinguished teachers at the time of I-tsing:

The following are the (most distinguished) teachers who now live in the West. Gnanakandra, a master of the Law, lives in the monastery Tiladha (in Magadha); in the Nalanda monastery, Ratnasimha; in Eastern India, Divakarmitra; and in the southernmost district, Tathagatagarbha. In Sribhoga of the Southern Sea resides Sakyakirti, who travelled all through the five countries of India in order to learn and is at present in Sribhoga (Sumatra).

All these men are equally renowned for their brilliant character, equal to the ancients, and anxious to follow in the steps of the Sages. When they have understood the arguments of *Hetuvidya* (logic), they aspire to be like *Gina* (the great reformer of logic); while tasting the doctrine of Yogakarya they zealously search into the theory of Asanga.

When they discourse on the ‘non-existence’ they clearly imitate Nagarguna; whilst when treating of the ‘existence’ they thoroughly fathom the teaching of Sanghabhadra. I, I-Tsing, used to converse with these teachers so intimately that I was able to receive invaluable instruction personally from them…

While still gathering a few gems left behind on the Vulture Peak. I picked up some very choice ones; when searching for jewels deposited in the Dragon River (Nagandai=Agiravati), I have obtained some excellent ones. Through the unseen help of the Three Jewels and by the far-reaching influence of the royal favour, I was enabled at last to turn the course of my travel eastward, sailed from Tamralipti and arrived at Sribhoga.

Here I have remained over four years, and, employing my time in various ways, have not yet determined to leave this place for my native country.

CHAPTER XL SUCH ACTIONS WERE NOT PRACTISED BY THE VIRTUOUS OF OLD

7. His Fore-knowledge of the Decrees of Heaven

On saints who visited China and India respectively:

From the time that the white horse[447] was unbridled till the dark elephant was saddled,[448] Kasyapamatanga and Dharmaraksha, illumining the world by their rays (of wisdom), became as it were the sun and moon of the Divine Land, and K'ang-seng hui and Fa-hien, by virtue of their example, became the ford and bridge to the Celestial Treasure House (India). Tao-an and Hui-yen[449] were stooping like tigers on the south of the rivers Yang-tze and Han; Hsiu and Li[450] were flying high like falcons on the north of the rivers Hwang and Chi.

Successors in the Order were found regularly and continuously; thus the wave of wisdom has been perpetuated uncorrupted. Devout laymen praised and appreciated the unceasing fragrance of the Law. …

I-tsing prepares to return home:

At last I embarked from the coast of Kwang-chou (Canton), in the eleventh month in the second year of the Hsien Heng period (AD 671), and sailed for the Southern Sea…

In the forty chapters of the present work I have treated only of important matters, and what I have recorded is customary at the present time among the teachers and pupils of India. My record rests distinctly on the words of the Buddha, and is not evolved from my own mind.

Our life passes swiftly like a rapid river. We cannot prognosticate in the morning what will happen in the evening. Thus fearing lest I may not be able to see you and state these things to you in person, I send the record and present it to you before my return. Whenever you have time to spare, pray study the matter recorded in the book, and thus you may approach my heart. All that I state is in accordance with the *Aryamulasarvastivadanikaya* (School) and no other.

CHAPTER — 16

HYE CH'O

Hye Ch'O, a native of Hsin-lo or the Kingdom of Silla in the Korean peninsula, was born around 700 AD. There is little information about him in the collections of monks in Chinese, but his *Memoir*[451] is invaluable to historians, religious scholars, and sociologists, as he visited India and Central Asia when Islam was emerging as a force in the region. Fragments of the manuscript *Memoir of a Pilgrimage to the Five Regions of India,* were discovered by Paul Pelliot at Tun-huang in 1908, and subsequently translated by scholars from Korea, China, Japan and Canada.

Hye Ch'O left South China before 724 AD and travelled by sea to India. Landing in the east, he visited the holy sites of Sarnath, Kusinagara, Rajagraha and Bodhgaya, besides the cities of Varanasi and Kanauj. From north-central India, he went south to the capital of the Chalukya kingdom, and thereafter to the Valabhi kingdom in the Kathiawar peninsula. He went to the north-west via Jalandhara and visited the kingdoms on the banks of the Indus, going further north to the Kashmir valley and its neighbouring countries. Travelling through Gandhara, Kapisa and other Central Asian states, he arrived at An-hsi, frontier city of the T'ang empire, which he identifies as Kucha, in December 727 AD.

On his return, Hye Ch'O probably stayed at Ch'ang-an in the Ta chien-fu monastery and worked under Vajrabodhi. The preface to the *Mahayana-yogavajra-prakrtisagara-manjusri-sahasrabahu-sahasrapatra-mahatantraraja-sutra* states that he begun to study this *sutra* on 21 January 733 (seventh day of the 21st year of the *K'ai-yuan* era). After eight years of study, the translation of the *sutra* was inaugurated by Vajrabodhi on 6 January 741. Hye Ch'O was assistant translator (*pei-shu*) or scribe. Vajrabodhi's death in the autumn of 741 caused suspension of the work, and under Vajrabodhi's last testament, the original Sanskrit manuscript of the *sutra* was sent back to India on 30 March 742. Thereafter, Hye Ch'O studied the later part of the *sutra* under Amoghavajra (704–774 AD) in November-December 774. On 23 May 780, he took the translation to the Wu-t'ai Mountain to be copied at the Ch'ien-yuan P'u-t'i Monastery.

Hye Ch'O was associated with the school of Tantric Buddhism which arrived in China with the Indian monk Subhakarasimha in 716; the latter settled at Ch'ang-an, and died in 735 at the age of ninety-nine. Both Vajrabodhi and Amoghavajra were Tantra masters, and scholars speculate that Vajrabodhi inspired Hye Ch'O's voyage to India to gain better knowledge of Tantric Buddhism. Hye Ch'O's Chinese prose was average, and his knowledge of Indian and Central Asian languages poor. Though he records the difference in language between countries, he fails to mention specific Indian languages or dialects. The accounts of different regions and kingdoms are skimpy, with even the names of rulers omitted. Further, like other Chinese pilgrims, he freely mixed facts with legends. Still, his *Memoir* is a valuable source for Indian and Central Asian history of the early eighth century AD because it is a contemporary record of the changing religio-political landscape of the region.

Hye Ch'O's records which countries in 727 were under the control of the Arabs, Turks, Tibetans, Chinese, and which were independent. The Arab thrust into Central Asia saw the waning of Chinese control of the region after the battle of the Talas River in 751, making Hye Ch'O's account probably the last Buddhist narrative of Central Asia before its conquest by the new religion of Islam. As Buddhism vanished from Central Asia, the traditional land route for its dissemination to China also withered away. As Hye Ch'O's account is already fragmentary, we present the passages in full:

1. VAISALI (?)

[… they do not honour the Three] Jewels[452] … They go barefoot and naked. The non-believers do not wear clothes…. They eat at any time because they do not observe *uposatha.* The land is completely flat… They have [no] slaves.[453] The crime of selling people is not different from that of murder…

2. KUSINAGARA

After a month's journey, I arrived at the country of Kusinagara. This is where the Buddha entered *nirvana.* The city is desolate and no people live there. The *stupa* was built at the site where the Buddha entered *nirvana.* There is a *dhyana* master who keeps the place clean. Every year on the

eighth day of the eighth month (*Karthik,* a Sarvastivada tradition), monks, nuns, clergy and laymen hold a great assembly of worship there. [On this occasion], numerous banners which were seen by all people would appear in the sky. On the same day, many people would resolve their minds [for the religion].

West of the *stupa* is the Airavati river (Ajitavati of Yuan Chwang). The river flows two thousand *li* southwards before it enters the Ganges. The *stupa* is isolated on all sides; no people go there. The forests are very deserted. Those on pilgrimage are [often] wounded by rhinoceros and tigers.

Thirty *li* southeast from the *stupa* is a monastery named Bandhana. There are more than thirty villages [allocated to this monastery, three or four of which] constantly make offerings to the *dhyana* masters to enable them to maintain religious services at the *stupa*…

3. VARANASI

[After …] days I arrived at the country of Varanasi. This country is also desolate. There is no king…

…the band of five [headed by Kaundinya].[454] I saw a clay statue on the *stupa.*

On top [of the pillar] there is a [statue of] a lion. The pillar is extremely beautiful. [Its circumference measures that of] five people[455] with joined arms. The lines carved on it are delicate. The pillar was made at the time the *stupa* [was constructed]. The monastery is named the Dharmacakra Sangharama…

The non-believers wear no clothes. They smear ashes on their bodies[456] and worship Mahadeva. In this monastery there are gilt bronze images [of Buddha] and the five hundred [Pratyeka Buddhas]. These images were made by Siladitya, a former king of Magadha. He also made a gilt (*dharma wheel*), which is over thirty paces in diameter. The city is built on the northern bank of the Ganges.

This Deer Park, along with Kusinagara, Rajagraha and Mahabodhi are the four great holy *stupas.* All these are situated in the territory of the Magadha kingdom. Both Mahayana and Hinayana are practiced in this country.

…I arrived at the Mahabodhi monastery. I was very happy as my long cherished wish had been fulfilled. I expressed my humble wishes in a five-word poem:

Untroubled by the distance to Mahabodhi
Unafraid that the Deer Park is far,
Only the dangerous path worried me.
Not caring how the evil wind blows.
To visit the eight *stupas* is truly not easy.
All places were burnt.[457]
How then could one's desire by fulfilled?
With my eyes I saw it this very day.

4. CENTRAL INDIA AND THE CUSTOMS OF THE FIVE REGIONS OF INDIA

From the country of Varanasi [I walked west for a] month and arrived at the city where the central-Indian king resides. The place is called Kanyakubja. The territory of the central-Indian king is very broad and the inhabitants are many. The king possesses nine hundred elephants while other great chiefs possess two to three hundred each. The king himself often leads troops into battle and frequently fights with the other four regions of India. The central-Indian king is always victorious.[458] According to the conventions of the countries, when one knows that it possesses a smaller number of elephants and soldiers, it immediately begs for peace and pays tribute annually. They do not fight on the battlefield and kill each other.

The dress, language, customs, and laws of the five regions of India are similar. Only the language of the village folk in south India is different. The class of officials is not different from that of central India.

The national laws of the five regions of India prescribe no cangue, beatings or prison. Those who are guilty are fined in accordance with the degree of the offence committed. There is no capital punishment. From the king down to the common people one sees no pleasure hunting with falcons or dogs or such similar activities. Although there are many bandits on the roads, they let their victims go alive after taking away their things. If the victim holds his things too dear, then he will at once suffer for it.

The land is very warm. All plants are always green. There is no frost or snow. The foods include rice, baked wheat flour, butter, milk and curds. Soy is not available but salt is. Everybody eats food cooked in earthenware pots. They do not have iron cauldrons or similar things.

Apart from paying one *picul* of grain out of every five to the king annually, the people have no other labour service or taxes. The king sends his own men to transport [the grain]; it is not the duty of the landowners. Most people of the land are poor; few are rich. Those from the royal family, official households, and the rich wear a pair of cotton cloths. Ordinary people wear one piece while the poor wear only half a piece. Women do the same.

Whenever the king sits in audience, chiefs and commoners all come and sit around him. Everyone argues for his own cause. Charges and countercharges are many and it becomes very confusing and noisy. The king listens but does not become angry. Deliberating, he passes judgment saying, ‘you are right’ or ‘you are wrong’. The commoners and others take the word of the king as final and complain no further.

The king and the chiefs sincerely honour and worship the Three Jewels. If they meet a monk-master, they sit on the ground, unwilling to sit on couches. The king and chiefs take their couches with them wherever they go or stay. They rest on them wherever they are and never use the couches of others. Monasteries and royal houses are all three-storeyed buildings. The ground floors are used as storage rooms while the upper floors are for dwelling. The [houses of the] great chiefs are the same. These houses are all even roofed, made of bricks and wood. Other houses are straw huts similar to the gabled Chinese houses. They are also one-storeyed.

The products of the land are only cotton cloths, elephants, horses, and other things. The land itself does not produce gold and silver, which are imported from foreign countries. Domestic animals such as camels, mules, asses, and pigs are not kept. Most cows are white. Among ten thousands head there is rarely one which is red or black. Both sheep and horses are few. Only the king has two to three hundred sheep and sixty to seventy horses. The great chiefs and the common people do not keep these domestic animals. They are only interested in rearing cattle, as they obtain milk, curds, and butter from them. The people of the land are good natured. They

do not like killing. In the markets one does not see any butchering or meat selling.

5. THE FOUR GREAT *STUPAS* OF CENTRAL INDIA

Both Mahayana and Hinayana are practiced in central India. In the territory of central India there are four great *stupas.* Three are situated north of the Ganges. One is located at the Anathapindika park in Sravasti. There are monasteries and monks there. The second one is at the Amarapali park in Vaisali. The *stupa* still exists but the monastery is deserted and ruined and without monks. The third one is situated in Kapilavastu, the city where the Buddha was born. The Asoka tree is still there but the city is already ruined. There is a *stupa* but no monks or inhabitants. The city is situated at the northernmost part [of the country]. The forests are mostly deserted and there are many bandits on the roads. It is very difficult for those on pilgrimage to go safely.

The fourth is the *stupa* with the three-landed jewelled staircase situated at a distance of seven days' journey west of the city where the central-Indian king resides. It lies between two streams of the Ganges. This is the place where the Buddha descended from the *Trayastrimsa* heaven to *Jambudvipa* by magically creating a three-landed jewelled staircase. The left lane is golden, the right one is silver, and the middle one is glazed with *vaidurya.* The Buddha came down the middle lane, Brahma from the left lane, Sakra from the right lane, both attending the Buddha. At this very spot a *stupa* was constructed. At present there are monasteries and monks.

6. SOUTH INDIA

From central India, walking south for more than three months, I arrived at the place where the south Indian king[459] resides. The king has eight hundred elephants. His territory is very broad: the south extends to the Southern sea, the east to the Eastern sea, the west to the Western sea, and the north adjoins the borders of central, west and east India. The dress, food, and customs are similar to those of central India. Only the languages are slightly different. The land is hotter than central India. The products of this land are cotton cloth, elephants, water buffalo, and yellow cattle. Also,

there are fewer sheep. They do not have camels, mules and asses. They have rice fields but no sorghum or millet. As for things such as floss and thin silks, they are not available in the five regions of India.

The king, the chiefs, and the common people highly revere the Three Jewels. There are many monasteries and monks. Both Mahayana and Hinayana are practiced. In the mountains there is a large monastery which was constructed[460] by *Yaksas* under order from the *Bodhisattva* Nagarjuna[461] and not built by human beings. Moreover, the pillars were cut from [rocks of the] mountain and built in three storeys. The monastery is over three hundred paces in circumference. During the days when Nagarjuna was alive, the monastery had three thousand monks. Only fifteen *piculs* of rice were given daily to them for maintenance, but the rice was never exhausted. [The excess rice] would be returned immediately, but afterwards there would be no reduction [in supply]. But at present the monastery is ruined and there are no monks. Seven hundred years after Nagarjuna this place began to decay.

When I was on the way to south India, I composed a poem in the five-word style:

On a moonlit night I looked towards the homeward path,
Floating clouds return by the wind,
I wish this letter to go with this opportunity,
The wind blows too fast; the clouds neither listen or return.
My country is in the northern horizon,
Other lands lie at the western extremity.
No wild geese in the hot south,
Who will take my words to the homeland?

7. WEST INDIA

Here Hye Ch'O makes the first reference to Arab invasions and the devastation of the land:

From south India I walked north for two months and arrived at the city where the king of west India resides. The west Indian king also possesses five to six hundred elephants. The products of this land are cotton cloth, silver, elephants, horses, sheep, and cows. Barley, wheat, and various kinds

of beans are produced in large quantities [but the production of] rice and corn is much less. Food is mainly bread, wheat preparations, curds, butter, and ghee. In the markets, silver money and cotton cloths are used.

The king, the chiefs, and the common people highly revere and believe in the Three Jewels. There are many monasteries and monks. Both Mahayana and Hinayana are practiced.

The land is very broad. To the west it reaches the Western sea. The people of this country are good at singing. [In this] the other four regions of India cannot be compared with this country. Here there is no cangue, beating, prison, capital punishment, and similar affairs. At present half the country has been invaded by the Arabs and is already ravaged. According to the law of the five regions of India, those who travel do not carry food. They can beg for food wherever they go. When the king and the chiefs travel, they take food with them so as not to bother the people.

8. NORTH INDIA (JALANDHARA)

For over three months I travelled north from west India and arrived at the country of north India, which is called Jalandhara. The king of this country has three hundred elephants. He resides in a city built on the hillside. From the hills the place gradually stretches northwards. As a country it is very narrow. The army and cavalry are small. It is often annexed by the central Indian king and Kashmir. This is the reason [the king] resides on the hillside.

The customs, dress, and language are not different from those of central India. The land is slightly cooler than central India and the other regions. There is also no frost or snow, but there is a cold wind. The products of this land are elephants, cotton cloth, rice, and wheat. Mules and asses are few. The king possesses a hundred horses, while each chief has three to five, and the common people have none. The western part of the country is a plain and the eastern part is close to the snowy mountains. There are many monasteries and monks in this country. Both Mahayana and Hinayana are practiced.

9. SUVARNAGOTRA

A small kingdom is to the east, a month’s journey through the snowy mountains. It is called Suvarnagotra, and is under the control of the

Tibetans. The dress is similar to that of north India, but the language is different. The land is extremely cold.

10. TAKKA

From Jalandhara I walked west and after a month arrived at the country called Takka. The language is slightly different, but the dress, customs, products of the land, climate, and temperature are similar to north India. There are also many monasteries and monks. Both Mahayana and Hinayana are practiced. The king, chiefs, and common people greatly revere the Three Jewels.

11. SINDHUKULA

Hye Ch'O mentions that half the territory has been lost to Arabs already:

From Takka I walked towards the west for another month and arrived at the country of Sindhkula. The dress, customs, climate, and temperature are similar to north India, although the language is slightly different. This county has many camels from which the people obtain milk and butter for food. The king and the people greatly revere the Three Jewels. There are many monasteries and monks. Sanghabhadra (from northern Kashmir), the Reverend Master of the *Sastras* and author of the *Nyayanusara sastra* was a native of this country. Both Mahayana and Hinayana are practiced in this country. At present it is being invaded by the Arabs and half of its territory has been lost. From this land to the five regions of India [people] rarely drink much. I have travelled across the five regions, but not have seen any drunken brawls. Those who drink do so only for the sake of energy and strength, but nothing more. I did not see any people who excessively enjoyed dance, drama, and feasting.

12. TAMASAVANA

Further from north India there is a monastery called Tamasavana. During the days when the Buddha was still alive he came and preached the *dharma* there. He enlightened large numbers of human and divine beings. There is a *stupa* on the bank of a stream east of the monastery where the hair and nails of the Buddha are preserved. At present there are over three hundred

monks. The monastery also has the relic tooth, bone, and other things of a great Pratyeka Buddha. There are seven or eight other monasteries. Each of these has five to six hundred monks. The monasteries are well-managed. They are highly respected by the king and common people.

13. NAGARADHANA

Hye Ch'O grieves for a Chinese monk who died in Central India while preparing to return home:

There is another monastery called Nagaradhana situated in the mountains. There was a Chinese monk who died in this monastery. The senior monks of the monastery said that the Chinese monk had come from central India and was brilliant and well-versed in the sacred teachings of the *Tripitaka.* He was about to return to his homeland, but suddenly fell ill and immediately died. Upon hearing the story, I grieved deeply. Thus, I wrote a poem in four rhymes to commemorate the monk who is now dead. The poem is in the five-words style:

The lamp at your home village has no owner.
The jewel tree fell in another country.
Where does the spirit go?
The precious countenance has turned into ashes.
Pondering this my sorrow is deep.
I grieve that your wish was not fulfilled.
Who knows the road to his native land?
Nothing to be seen but white clouds returning.

14. KASMIR

From there [Sindhukula] I walked north for fifteen days, entered a mountainous place, and reached the country of Kasmir.[462] Kasmir is counted as part of north India. It is a rather big country. The king possesses three hundred elephants and resides in the mountains. The roads are dangerous and bad. It has not been invaded by any foreign country. The population of this country is quite flourishing. The poor are many and the rich are few. The dress of the king, chiefs, and rich men is not different

from that of central India. The common people cover their ugly bodies with woollen blankets.

The products of this land are copper, iron, cotton cloth, woollen blankets, cows, and sheep. There are elephants, a few horses, rice, grapes, and other things. The land is extremely cold, which is different from the countries mentioned before. There is frost in autumn and snow in winter. In summer there is plenty of rainfall. The plants are always green and the leaves thick. In winter the grasses wither.

The valley is narrow and small. From south to north it takes a journey of five days. From east to west, it takes one day to complete the journey. These are the boundaries of the valley. The rest [of the country] is dense mountains. The roofs of the houses are covered by rows of plants. Straw and tiles are not used. The king, chiefs, and the common people greatly revere the Three Jewels. There is a dragon pool. The dragon king gives daily offerings to one thousand *arhat* monks. Although no one has witnessed these holy monks taking food, after the offerings, cakes and rice have been seen coming up from below the water. From this it is known [that they receive food]. To this day these offerings have not ceased. The king and chiefs ride on elephants when they go out. Minor officials ride on horses while the common people all go on foot. There are numerous monasteries and monks in the country. Both Mahayana and Hinayana are practiced.

Following the practice of the five regions of India, from the king, the queen, consorts, and princes down to the chiefs and their wives, all separately build monasteries in accordance with their respective capabilities. They say when each person has his own meritorious virtues, why should joint effort be necessary? Such being the case, other princes follow that [practice].

Whenever a monastery is built, a village and its inhabitants are immediately donated as an offering to the Three Jewels. Building a monastery without making any donation of a village and its folk is not done. It being the practice of this foreign country, the king and his wives have separate villages with their inhabitants. The princes and chiefs also have their villages and their inhabitants which they donate independently without consulting the king. This also applies in the case of building monasteries. When necessary to build, they do so, and the king is not asked.

The king dares not stand in the way because he is afraid that it would taint him with bad deeds.

As for the rich commoners, though having no villages to donate, they also try their best to build monasteries and manage them by themselves. Whenever they obtain things, they offer them to the three Jewels. As in the five regions of India, human begins are not sold. Since there are no slaves, it is necessary to donate villages and their inhabitants [to the monasteries].

15. GREATER BOLOR

Tibetan rule and Buddhism:

From Kasmir I crossed the mountains and travelled northeast for fifteen days. The countries here are Greater Bolor, Yang-t'ung, and Sha-po-tz'-u. These three countries are all under Tibetan authority. The dress, language, and customs of the people are all different. People wear furs, cotton shirts, boots, and trousers. The land is narrow and the mountains and streams are extremely dangerous. There are also monasteries and monks. People respect and believe in the Three Jewels. Eastwards from here is Tibet [where] there are no monasteries or houses [and where] Buddhism is not known. Because the people [of Greater Bolor, Yang-t'ung and Sha-po-tz'-u] are Hu people, they believe [in Buddhism].

16. TIBET

No Buddhism in Tibet at this time:

To the east lies Tibet. It is situated among glaciers, snowy mountains and valleys. People dwell in tents made of felt. Here there are no cities, suburbs or houses. The residential quarters are similar to those of the Turks. Their dwellings shift with the course of water and grass. Though the king stays in a fixed place, there is no city. He resides and carries on with his work in felt tents. The products of this land include sheep, horses, yaks, and woollens. The dress [of the people] is made of woollens and furs. The dress of the women is the same. The land is extremely cold, unlike the other countries. Usually the food of families is parched grain; rice and pastry are rare. The king and the common people all do not know Buddhism. There are no

monasteries or houses. The people hollow out the ground and thus make earthen beds to sleep on. There are no couches and mats. The people are very dark; there are no fair ones. The language is different from other countries. The inhabitants here are fond of eating lice, as they wear woollens which have many lice and nits. Whenever they catch one, they immediately put it into their mouths. They would never throw it away.

17. LESSER BOLOR

Chinese rule, religion not stated:

From Kasmir I travelled further northwest for seven days, crossed the mountains, and arrived at the country of Lesser Bolor, which is under Chinese rule. The dress, customs, food and language are similar to those of Greater Bolor. The people wear cotton shirts and boots, cut their beards and hair, and bind their heads with a piece of cotton cloth. Women keep their hair. The poor are many and the rich are few. The valleys are narrow and cultivable lands are limited. The mountains are withered and sterile with no trees or grass. Greater Bolor was originally the place where the king of Lesser Bolor resides. It was because the Tibetans have come that he fled and shifted his residence to Lesser Bolor. The chiefs and common people remained and did not come [with the king].

18. GANDHARA

Buddhism and the Turks:

From Kasmir I travelled further northwest. After one month's journey across the mountains I arrived at the country of Gandhara. The king and military personnel are all Turks.[463] The natives are Hu people; there are also Brahmins. The country was formerly under the influence of the king of Kapisa. A-yeh, the Turkish prince, took a defeated cavalry and allied himself to the king of Kapisa. Later, when the Turkish force was strong, the prince assassinated the king of Kapisa and declared himself king. Thereafter, the territory from this country to the north was all ruled by the Turkish king, who also resided in this country.

The mountains are withered with no grass or trees. The dress, customs, language, and climate are all different [from other lands]. The dress includes furs, cotton shirts, boots, and trousers. The land is suitable for barley and wheat. There is no sorghum, millet, or rice. People mostly eat parched grain and pastry. Except for Kasmir, Greater and Lesser Bolor, and Yang-t'ung, the rest of the countries from Gandhara to the five regions of India, and further to the Malay archipelago, all do not produce grapes, but only sugarcane.

The Turkish king possesses five elephants and countless sheep and horses. Camels, mules, and asses are plentiful. [Because] China [fights] against the Hu people one cannot go east without detour. Towards the south the road is dangerous and difficult, and there are many bandits. From here to the north, evil occupations are many. There are many butcheries in the towns' shops.

Though the king is of Turkish origin, he greatly believes and respects the Three Jewels. The king, the royal consort, the prince, and the chiefs build monasteries separately and worship the Three Jewels. The king institutes the great feast of the *Wu-che* assembly twice a year. Whatever he personally likes and uses – his wife, elephants, and horses – he donates [to the *Sangha*]. The king asks only that the monks fix the price of his wife and elephants, so that he can redeem them. As for the rest, the camels, horses, gold and silver, clothes, and furniture, are all sold by the monks. The amount is shared by the monks for their expenditures. These are the differences between this king and the other Turkish kings of the north. His sons and daughters act similarly, separately building monasteries, offering feasts, and giving donations.

The city is built on the northern bank of the great Indus river. Three days' travel from this city to the west, there is a great monastery which was the residential monastery of *Bodhisattvas* Vasubandhu[464] and Asanga. The monastery is called Kaniska. There is a great *stupa* which constantly glows. The monastery and the *stupa* were built by the former king Kaniska, so the monastery was named after him.

Southeast... *li* from this city is the place where the Former Buddha saved the dove for King Sibi.[465] At present there are monasteries and monks. The place where the Former Buddha offered his head and eyes to the *five Yaksas*

is also situated in this country. The places are all in the mountains southeast of the city. Each of these places has monasteries and monks, which are presently being supported. Both Mahayana and Hinayana are practiced here.

19. UDYANA

Buddhism prevails:

From Gandhara, going directly north, I entered the mountains, travelled for three days and arrived at the country of Udyana, which its people call Uddiyana. The king of this country greatly reveres the Three Jewels. Most of his villages and their inhabitants have been donated for the support of the monasteries. Only a few villages remain his own and even food and clothing from them are donated to the monasteries. He daily offers feasts [to the *Sangha*]. There are many monasteries and monks. There are slightly more monks than laymen. The dress, food, and customs here are similar to Gandhara, though the languages are different. The land has many camels, mules, sheep, cotton clothing, and similar things. The climate is very cold.

20. CHITRAL

Buddhism prevails here:

From Udyana, after fifteen days journey travelling further north-east, I arrived at the country of Chitral which its people call *Sha-mo-chieh-lo-che*. The king also reveres and believes in the Three Jewels. There are many monasteries and monks. The dress and language are similar to those of Udyana. The people wear cotton shirts and trousers. There are also sheep and horses.

21. LAMPAKA

Buddhism prevails here:

Further to the west from Gandhara, I entered the mountains, and after seven days journey arrived at the country of Lampaka. The country has no king, but has a great chief. The country is also subject to Gandhara. The dress and language are similar to those of Gandhara. There are also

monasteries and monks here. The Three Jewels are revered and believed. Mahayana Buddhism is practiced.

22. KAPISA

The region is ruled by Turks; the native people are Hu; also a Buddhist country:

From Lampaka, I again entered the mountains. After eight days journey I arrived at the country of Kapisa. This country is also under the authority of the king of Gandhara. During the summer the king comes to Kapisa and resides here because of the cool temperature. During the winter he goes to Gandhara and resides at that warm place because there is no snow and it is warm and not cold. In the winter the snows accumulate in Kapisa. This is the reason for the cold.

The natives of the country are Hu people; the king and the cavalry are Turks. The dress, language, and food of this place are mostly similar to Tokharistan (the Turkish race and ancestors of the T'ukuh), though there are small differences. Whether man or woman, all wear cotton shirts, trousers, and boots. There is no distinction of dress between men and women. The men cut their beards and hair, but the women keep their hair. The products of this land include camels, mules, sheep, horses, asses, cotton cloth, grapes, barely, wheat, and saffron.

The people of this country greatly revere the Three Jewels. There are many monasteries and monks. The common people compete in constructing monasteries and supporting the Three Jewels. In the big city there is a monastery called *Sha-hsi-ssu*. At present, the curly hair and the relic bones of the Buddha are to be seen in the monastery. The king, the officials, and the common people daily worship these relics. Hinayana Buddhism is practiced in this country. The land is situated in the mountains. On the mountains there is no vegetation. [It looks] as if the land had been burned by fire.

23. ZABULISTAN

The region is ruled by Turks; the native people are Hu; also a Buddhist country:

From Kapisa I travelled further west and after seven days arrived at the country of Zabulistan which its people call *She-hu-1o-sa-t'a-na*. The native are Hu people; the king and cavalry are Turks. The king, a nephew of the king of Kapisa, himself controls his tribe and the cavalry stationed in this country. It is not subject to other countries, not even his own uncle. Though the king and the chiefs are Turks, they highly revere the Three Jewels. There are many monasteries and monks. Mahayana Buddhism is practiced. There is a great Turkish chief called Sha-tuo-kan, who once a year lays out his gold and silver, which is much more than the king possesses. The dress, customs, and products of this land are similar to those of Kapisa, but the languages are different.

24. BAMIYAN

Buddhism prevails here:

From Zabulistan I travelled further north and after seven days arrived at the country of Bamiyan. The king here is a Hu, and is independent of other countries. His cavalry is strong and numerous, and other countries dare not invade this land. The clothing consists of cotton shirts, furs, felt shirts and such. The products of this country include sheep, horses, and cotton**.** There are plenty of grapes. The land has snow and is extremely cold. The dwellings are mostly on the mountainside. The kings, the chiefs, and the common people highly revere the Three Jewels. There are many monasteries and monks. Both Mahayana and Hinayana are practiced. The inhabitants of this country and those of Zabulistan cut their beards and hair. The dress is similar to that of Kapisa. Nevertheless, there are also many differences. The local dialects are different from those of other countries.

25. TOKHARISTAN

Arab armies are in control here:

From Bamiyan I travelled further north and after twenty days arrived at the county of Tokharistan. The capital city is called Pactra. At present, the place is guarded and opposed by Arab forces. The original king was compelled to leave the capital, and he resided at Badakshan which is one

month's journey from the capital towards the east. It is also under the authority of the Arabs.

The language [of this country] is different from that of other countries. Though it is similar to the language of Kapisa, for the most part it is different. The dress is mostly made of fur, cotton, and similar things. From the king and chiefs down to the common people, all use fur as the outer garment. The land has many camels, mules, sheep and grapes. As far as food is concerned, the people are only fond of pastry. The land is cold. There is fog and snow during the winter. The king, the chiefs, and the common people respect the Three Jewels. There are many monasteries and monks. Hinayana Buddhism is practiced. They eat meat, onions and leeks. They do not profess any other religions. All men cut their beards and hair, but women keep their hair. The land is mountainous.

26. PERSIA

Arab rule in Persia:

From Tokharistan I travelled further west and after one month arrived at the country of Persia. Formerly, the king of this country ruled over the Arabs. One Arab, the camel keeper of the Persian king rebelled, assassinated the king, and declared himself the ruler. This is the reason why the country is now annexed by the Arabs.

The dress is a wide cotton shirt. [The people] cut their beards and hair. They eat pastry and meat. Even if there is rice, they would grind it, make it into pastry, and then eat it. The products of the land are camels, mules, sheep, horses, big asses, cotton cloth, and precious articles. The language is different from that of other countries.

The natives of this land are naturally skilful in trade. They frequently sail to the western sea and enter the southern sea, and take precious things from the country of Ceylon. Thus, they claim that the land [Persia] produces all precious things by itself. They also take gold from the Malay archipelago, sail to Chinese territory, and proceed straight to Canton to buy silk gauze, silk wadding, and similar things. The land produces fine cotton. The

inhabitants like to slaughter animals. They serve Heaven and have no knowledge of Buddhism.

27. ARABS

A new religion of heaven:

From the country of Persia, I travelled further north and after ten days arrived at the country of the Arabs. The king of this country does not stay on his own land. At present, he resides in Lesser Fu-lin[466] because he has conquered it. Moreover, that place is an island-like strong fortress, which is the reason the king resides there.

The products of this country are camels, mules, sheep, horses, cotton, woollen carpets, and precious things. The dress is a wide shirt made of fine cotton. Another piece of cotton added over the shirt is the outer garment. The king and the common people wear the same kind of clothing without distinction. Women also wear wide shirts.

Men cut their hair, but keep their beards. Women keep their hair. When they eat food, there is no distinction between noble and commoner. They take food together from the same plate with their hand: and also use spoons and skewers. They very much dislike taking readymade things. They say that to eat the meat that is slaughtered by one's own hands brings boundless fortune. The inhabitants of this country are fond of slaughtering. They serve Heaven, and have no knowledge of Buddhism. In the law of the country, there is no convention of prostration.

28. GREATER FU-LIN

The Arabs and Turks have failed to subjugate this region at present:

Northwest of Lesser Fu-lin, along the sea shore, is the country Greater Fu-lin.[467] The king has a very strong and large army. He is not subject to any other country. The Arabs made a few attacks, which did not succeed. The Turks also tried an invasion, which was also unsuccessful. The land has many precious things. Camels, mules, sheep, horses and such are very abundant. The dress is similar to that of Persia and the Arabs. The language is distinct from others.

29. SIX COUNTRIES OF CENTRAL ASIA

The Arabs have subjugated all of these countries:

From the country of the Arabs to the east, all the countries belong to the Hu people. These are the countries of Bokhara, Kaputana, Kish, Shih-lo, Maimarg, and Samarkand. Though each of these countries has its own king, they are all under the authority of the Arabs. These countries are small, their armies are very limited, and they are unable to protect themselves. The products of these lands include camels, mules, sheep, horses, and cotton. The dress is cotton shirts, trousers, and furs. The languages are different from those of other countries.

Moreover, all these six countries serve the Fire Religion.[468] They have no knowledge of Buddhism. Only in Samarkand is there one monastery and monk, who does not know how to revere [the Three Jewels]. In these countries of the Hu people, both the beard and hair are cut. People like to wear white caps made of cotton. One extremely bad custom is incestuous marriages, [which allows] one to take his own mother or sisters as his wives. The Persians also take their mothers as their wives. In the country of Tokharistan and those of Kapisa, Bamiyan, and Zabulistan, two, three, five, or even ten brothers are jointly married to one wife. They are not allowed to marry separately as they are afraid that separate marriages would ruin their livelihood.

30. FERGHANA

The Arabs and Turks are ruling this region:

To the east of Samarkand is the country of Ferghana[469] where they have two kings. The great Fu-yu river flows to the west from the centre of the country. The king to the south of the river is subject to the Arabs. The king to the north of the river is subject to the Turks. The products of the land include camels, mules, sheep, horses, and cotton cloth. The dress is made of fur and cotton. The food is mainly pastry and parched wheat. The language is different from that of other countries. The inhabitants have no knowledge of Buddhism. There are no monasteries, monks or nuns.

31. KHUTTAL

Turks and Arabs incharge here; people Hinayana Buddhists:

East of Ferghana there is a country called Khuttal (from the Caspian to the Aral Sea; or the latter to the Balkhash). The king is of Turkish origin. Half of the local inhabitants are Hu people, and the other half are Turks. The products of this land include camels, mules, sheep, horses, cows, asses, grapes, cotton cloth, and woollen rugs. The dress is made of cotton and fur. The language is one-third Tokharian, one-third Turkish, and one-third local dialect. The kings, the chiefs, and the common people respect and believe the Three Jewels. Hinayana Buddhism is practiced. This country is under the control of the Arabs. Although other countries call it a country, its size is only comparable with a great prefecture in China. The men of this country cut their beards and hair. The women keep their hair.

32. TURKS

The Turks rule:

From the country of the Hu people up to the northern sea in the north, the western sea in the west, and China in the east, is the territory inhabited by the Turks. The Turks have no knowledge of Buddhism. There are no monasteries or monks. The dress is fur and woollen shirts. Insects are used for food. There are no cities or houses. Felt tents are used for houses, which people carry with them wherever they go. The movement of the Turks follows the course of water and grass. The men cut their beards and hair. The women keep their hair. The language is different from that of other countries. The people of this land are fond of killing. They do not distinguish between good and bad. The land has many camels, mules, sheep, horses and such.

33. WAKHAN

Another region dominated by Arabs; here Hye Ch'O met the Chinese envoy:

From Tokharistan I walked east for seven days and arrived at the city where the Wakhan king resides (in Persia). When I was at Tokharistan, I met the Chinese Ambassador to foreign lands. I wrote a five-word poem in four rhymes, to express my feelings:

You complain that the way to the Western Barbarians
is distant.
I lament for the long way east:
Barren roads on huge snowy ranges,
Dangerous torrents and bandits at every turn,
Flying birds are alarmed by the precipitous cliffs,
People are in danger walking on slanting bridges.
I, who have never wept in my life,
  Now shed a thousand tears.

[Another poem on the] snowy day at Tokharistan in the five word style:

Cold snow becomes ice,
Cold winds crack the earth,
Great oceans of snow, frozen, and extending far,
Rivers and streams erode the sides of the cliffs,
Even the Dragon Gate waterfall becomes frozen.
Wells seem to be covered by coiling snakes,
  With fire I climb up the steps and sing.How can I cross the Pamirs?

The king of Wakhan has a small and weak cavalry and can not protect himself. At present he is under the authority of the Arabs. He pays annually three thousand rolls of silk to the Arabs. He is stationed in a valley which is narrow and most people are poor. The dress is fur and woollen shirts. The king wears silk gauze and cotton cloth. Only pastry and parched wheat are used for food. The land is much colder than other countries. The language is different. The sheep and cows of this country are very small. There are also horses and mules. The monasteries and monks are there. Hinayana Buddhism is practised. The king, the chiefs, and the common people all serve Buddha and do not belong to other religions. This is the reason why other religions are not in this land. The men cut their beards and hair. The women keep their hair. The people live on the mountains where there are no trees, water, or grass.

34. NINE SHIH-NI COUNTRIES

Land dominated by Chinese rulers:

In the northern mountains of Wakhan there are nine Shih-ni[470] countries. Each of these nine kings commands his troops and they are stationed [in one place]. One of them is subject to the king of Wakhan. The rest are independent and not subject to any other country. Recently there were two K'u kings who submitted to China, and messengers are continuously sent to An-hsi.[471] Only the king and chiefs wear cotton and furs; the rest of the common people wear fur and woollen shirts. The land is extremely cold, [people] make their homes on the snowy mountains. This is different from other countries. Here there are sheep, horses, cows, and donkeys. The language is different from that of other countries. The king often sends two to three hundred men to the valley if Ta-po-mi to plunder the Hu traders as well as the messengers. Even if they took silk, they would pile it in storage rooms, and let it rot as they do not know how to make clothing. In these Shih-ni countries, Buddhism is not practiced.

35. TS'UNG LING

Chinese control, then Tibetan:

From Wakhan I travelled for another fifteen days towards the east, across the Po-mi valley and arrived at the garrison town of Ts'ung Ling (Tashkurghan). The town is under Chinese control and Chinese troops are on guard here. Formerly, this was the territory of King P'ei-hsing,[472] but that king rebelled against China, fled and submitted to the Tibetans. There are no inhabitants in this country at present. The foreigners call this place K'o-fan-t'an (Kharbanda, Iran), the Chinese name is Ts'ung Ling.

36. KASHGAR

Chinese control and Hinayana Buddhism:

From Ts'ung Ling I travelled (same route Yuan Chwang took back to China) another month and arrived at Kashgar. The foreigners call this place Kashgiri. The place is also guarded by Chinese troops. There are

monasteries and monks. Hinayana Buddhism is practised. People eat meat, onions, leeks, and such. The local inhabitants wear cotton clothes.

37. KUCHA

Chinese control and Hinayana and Mahayana Buddhism:

From Kashgar I travelled further east for one month and arrived at the country of Kucha.[473] This is the headquarters of the great protectorate of An-hsi,[474] the place where Chinese troops are gathered. In Kucha there are many monasteries and monks. Hinayana Buddhism is practised. The foods are meat, onions, leeks, and such. The Chinese monks practice Mahayana Buddhism.

38. KHOTAN

Chinese control and Mahayana Buddhism:

Two thousand *li* from An-hsi is the country of Khotan.[475] There are also many Chinese troops stationed here. There are many monasteries and monks. Mahayana Buddhism is practised. No monks eat meat.

From here eastward is all the territory of the Great T'ang empire. This is known to all. One can understand [the Situation] without further explanation.

39. MONASTERIES OF AN-HSI

This region is controlled by China and is still Buddhist:

I arrived at An-hsi during the first ten day period of the eleventh moon of the fifteenth year of the *Kai-yuan* era (18-27 December 727 AD). At that time, the military governor was his excellency Chao.

There are two monasteries presided over by Chinese monks. They practice Mahayana Buddhism and eat no meat. The abbot of the Ta-yun monastery is Hsiu-hsing, who is well versed in discourse and speech. Previously, he was a monk of the Ts'i-pao-t'an Monastery in the capital. The Duty Distributor (temple in-charge) called Yi-ch'ao understands the *Vinaya*

Pitaka very well. Previously he was a monk of the Chuang-yen Monastery in the capital. The Chief Chair of the Ta-yun Monastery called Ming-yun, who had a high moral character, originally came from the capital. These monks are good chiefs. They possess religious determination and perform religions worship with joy.

The abbot of the Lung-hsing Monastery is called Fa-hai. Though he is a Chinese born in An-hsi, his scholarship and manners are not different from those of China.

There is a Chinese monastery called Lung-hsing-ssu in Khotan. A Chinese monk called … is the abbot of the monastery, and he is a good abbot. This monk is a native of Chi-cho in Ho-pei.

There is also a Chinese monastery called the Ta-yun-ssu in Kashgar. A Chinese monk resides over the monastery, who is a native of Min-chou.

40. WU CHIH

Chinese troops are in control here:

From An-hsi I travelled further east for… and arrived at the country of Wu-chih. The place is also guarded by Chinese troops. There is a king, and the inhabitants are Hu people. There are many monasteries and monks. Hinayana Buddhism is practiced.

There are four towns in the An-hsi region, namely An-hsi [Kucha], Khotan, Kashgar, and Wu-chih… they follow Chinese customs. Around their heads they wear [turbans]…

CHAPTER — 17

KHMER'S HINDU KINGDOM

Many years after publishing his famous article on Funan, French Sinologist Paul Pelliot published some notes on Indo-China, from which the extract below is taken. Pelliot believed Hun-t'ien made a continuous voyage from India, and that Hun-t'ien is the exact Chinese transcription of Kaundinya, whom Indian legend maintains was a great Brahmin who received his spear from Asvatthaman, son of Drona, teacher of the Pandavas in the epic *Mahabharata*. He felt the name of the native queen, Liu-yeh, "Willow Leaf," was possibly a graphic alteration of Ye-ye, "Coconut Leaf," as the willow was unknown to Funan. Others think the story of Hun-t'ien and Liu-yeh is a local variant of the Indian legend of the Brahmin Kaundinya and the *Nagi* Soma, daughter of Soma, King of the Nagas. It is likely Kaundinya gave his wife the mythological name of Soma, as he had taken that of Kaundinya (a Brahmin *gotra*).

According to Pelliot, Kaundinya's conquest of Liu-yeh probably took place in the second half of the first century AD. They had a son who succeeded to the throne, giving rise to the Hun, or First Kaundinya, dynasty, which ruled Funan for over one hundred and fifty years. The kingdom seems to have initially consisted of settlements along the Mekong, between the present cities of Chaudoc and Phnom Penh, each under a local chief. Chinese accounts state that Kaundinya gave seven "cities" to his son as a royal fief, thus introducing a sort of feudalism into Funan, while keeping the rest of the country under his direct rule. The Angkorean civilisation lasted five centuries. The earliest Chinese visitors called the Khmer empire Funan, and the unflagging Chinese commitment for recording history has bequeathed valuable documents on this civilisation which was built, neither by Chinese nor Indians, but by the unique Mon-Khmer people.

THE FIRST KAUNDINYA DYNASTY AND THE 'FAN' RULERS[476]

The Legend of Hun-t'ien and Liu-yeh

The legend of the founding of the Kingdom of Funan, probably in the latter part of the first century AD, comes to us from Chinese sources.

At the beginning, Funan had for a sovereign a woman named Liu-yeh. There was a man from the country of Mo-fu, called Hun-t'ien, who loved to render a cult to a genie, with unrelaxing ardour. The genie was touched by his extreme piety. At night, (Hun-t'ien) dreamed that a man [genie?][477] gave him a divine bow and ordered him to go on board a great merchant junk and go to sea. In the morning Hun-t'ien entered the temple, and, at the foot of the tree of the genie, he found a bow. He then boarded a great ship and went to sea. The genie directed the wind in order to make (the ship) arrive at Funan. Liu-yeh wished to pillage (the ship) and take possession of it. Hun-t'ien raised the divine bow and fired. (The arrow) pierced the bark (of Liu-yeh) from side to side. Liu-yeh, frightened, submitted, and thus Hun-t'ien became king of Funan (666, 245-246).

According to Chinese accounts, the young queen, Liu-yeh, was "celebrated for her virile force and her exploits" (584, 436). Hun-t'ien married her and became king. Not content with seeing her go naked, as was then the custom of both men and women in Funan, he dressed her in a fold of cloth, with a hole through which she passed her head, and made her do her hair up in a knot. This was the beginning of women's clothing and styles in Funan.

No fixed amount or type of raiment, it appears, was demanded by the tribunal of Fame, and Liu-yeh (Willow Leaf) had become queen of her little riverain kingdom and was to go down to posterity "clad only in tropical sunbeams." This did not, however, please the educated taste of her newly-acquired husband, and he became the initiator of the first styles of women's costumes in Funan; which styles, moreover, have changed little in the nineteen centuries which have elapsed since the coming of Hun-t'ien to that remote and beautiful little kingdom in the delta jungle beside the turbulent Mekong. If, however, the dress demanded by Hun-t'ien was designed to cover the breast, it soon descended to the lower level; for, to this day, in the region where once lived the primitive Funanese, the Cambodian descendants, male and female, often go naked above the waist.

*

The colossal and awesome statuary of Cambodia's Angkor Wat has ever left visitors spellbound and speechless. Communist China's most famous writer, Han Suyin,[478] found herself drawn repeatedly to the monuments, bewitched by their beauty and power. Yet many, she discovered, simply hated it for its sheer size and the fact that it was built for non-human use.

Angkor was built for the idea of divinity; for the setting down in stone of the divine power of the kings of Angkor. But the kings and the nobles and the people did not live in these stone structures. They lived in houses of wood, or thatch, in and around the temples. Angkor is therefore the greatest complex of temples and monuments massed together in the world; none of these was ever intended to be utilised by mere mortals. The king who built his monument might live near it; and the monument assured his power, his *linga*, his rule, his worship. It was his divine substance; his body was the mere human envelope.

One night two thousand years ago, it is said, a god visited a youth in India and said to the young man, named Kaundinya: "Find a bow, board your boat, sail toward the rising sun." Kaundinya went to the temple next morning and there found, on the floor, a bow with a quiver full of arrows; he embarked and the god-driven wind blew him across the elephant-backed sea to a shore where Willowleaf, the beautiful queen and leader of the Khmer amazons, reigned. The queen launched her war canoe to repel Kaundinya, but the youth shot it through with his arrows, and she submitted to him. They were married, and thus was born the dynasty of the first Khmer kingdom.

… In the twelfth and thirteenth centuries, the kingdom was at the height of its power, under such monarchs as Suryavarman II and Jayavarman VII. The latter built many monuments, but his greatest undertaking was the Bayon temple at the centre of Angkor Thom, which was supposed to be the centre of the world, the umbilicus, the omphalos.

The Bayon is perhaps the most fabulous and strange monument in the world. It is a work of sculpture, not architecture, and it is a riddle until suddenly one looks at it and exclaims, "It is a lotus, a flower of stone!" For it is an enormous flower, with all its many towers, looking to encompass the whole world, up to the farthest horizon; the visible and the invisible; as the sun's eye makes the harvest ripen, so the eyes of the Bayon keep the world

in equilibrium, assure that the sun and moon do not change places; for sight is command and possession, sight is immortality through awareness. It is said that the heads and the faces are those of the great king Jayavarman VII, whose compassion was so great he suffered his subjects' woes, and thus his eyes multiplied many times to look to their welfare beyond death.

The Bayon is also an astrological monument; for today, as a thousand years ago, the Khmers believe in soothsayers and prophecies…. The Bayon housed within it a huge replica of Jayavarman VII as Buddha; it had no other purpose than the commemoration of the king's divinity. Today, no Khmer will come by night to the Bayon, nor venture near it, for it is said that to do so is to tempt fate, and a swift death follows…

Angkor Wat, the largest and the best proportioned and harmonious of all the temples, is like a prodigious funeral pyre of a divine king… And along the galleries, hundreds of yards long, are the scenes from the great Indian epics, the *Ramayana* and the *Mahabharata*…

One of the most popular of the Khmer monuments for many Westerners is Banteay Srei, "*The Citadel of Women*," a work much nearer to the Indian style. Personally, I do not feel so stimulated by it; it is too beautiful, too perfect – exquisite and small and charming in its pink stone…

To Keo, the crystal tower; Pre Rup, the pyramid with the name of "the body turning"; the enormous Bakong – these and so many of the other great temples are representations of Mount Meru, the great cosmic, five-tiered mountain of the world, which is also symbolised in the five-roofed pagodas of Nepal, in the *gopuras* of India, the pagodas of China, and Barabudur in Indonesia.… And wherever these temple-mountains appear, it is in celebration of the divine essence, the power and the glory, not in tribute to man. All the fabulous enormousness of Angkor is the tremendous expression in stone of man's will to live beyond himself, to govern time and space beyond the allotted span of his own days. Hinduism, Buddhism, the strong imagination and vivid skill of the indigenous Khmers – all combined to produce an order, a culture, which lasted many centuries, and died of its own profligacy, of its own lavish and heedless use of manpower to build for the gods, until no one was left for the wars or for the harvest.

For that is what happened. At the time of Angkor's greatest splendour, under Jayavarman VII, the Bayon was built. Yet parts of it have been left unfinished, as if some great war, some scourge, had stopped the sculptor's

chisels in place. After the Bayon, no more great monuments were built – the Bayon marks the end…

Thus Angkor died: it died of its own splendour, magnificence, architectural megalomania. In 1432 it was abandoned as the capital of the kingdom. The irrigation system that had kept it alive fell into disuse. Then another invader came – the jungle: trees ate into the heads and stones; they smothered Angkor. But Angkor was not forgotten by the Khmer peasants, although it appeared lost to those who knew only a later capital city, Phnom Penh… it was not until the nineteenth century that an adventurous Frenchman made his way through the jungle, perceived the cone-shaped towers of Angkor Wat, and then wrote about the Khmer monuments to bring them back to general public awareness.

The prophecy had predicted, the peasants said, that after 500 years Angkor would rise again. And it was in the twentieth century, almost exactly five centuries later, that the French School of the Far East, which had many eminent members, helped to reconstruct a large part of Angkor and made it the wonder and pride of Cambodia, a marvel of the world, an unbelievable, enriching experience for all those who are sensitive to beauty and great art.

“As the grace of spring on the gardens, as the night of fullness for the moon, thus, ravishing in its splendour the beauty of your body … and like the bees gathering at the hive, the eyes of men have turned toward you, to quench their thirst for beauty.”

.

CHAPTER — 18

IL YON

The ancient history of Korea, titled, *Samguk Yusa* or "*Annals of the Three Kingdoms*," hints at early ties between Korea and India. The reference to an Indian princess from Ayodhya, who married King Kim Suro, founder of the "Kaya" or Gaya Kingdom (42-562), which possibly stimulated direct contacts with India, is fascinating to scholars and general readers alike. According to the legend, the princess arrived at a Korean port with a *stupa* on 27 July, 48 AD. Parts of the *stupa* are still extant; the stones are not Korean, but imported. This unique *stupa* in front of the Ayodhya queen's tomb bears the Hindu symbol of "*Surya*," the sun god.

Samguk Yusa was compiled by the monk II Yon (also Ilyon) in the thirteenth century, with a view to foster Korean unity in the face of an impending Mongolian invasion. He claimed it to be a sketchy extract from *Karak-kuk-ki*, a narrative by Munin, magistrate of Kumgwan County during the reign of the Koryo King Munjong (1046-1083). It mostly comprises of legends, but some is based on fact. Karak lay on Korea's southern coast in ancient times and the tribes were known as *Kaya*.

Although Ilyon was not among the pilgrims who visited India, his narrative contains a Korean queen's claim: "I am a princess of Ayodhya," and thus links the region to India. Ayodhya, capital of King Dasratha, father of Sri Rama, is situated in present day Faizabad, Uttar Pradesh. Korean writer Lee Jong Ki visited Ayodhya in 1974 and found an amazing similarity between the motifs on certain temples in the Indian town and the royal tomb at Kimhae, ancient capital of Kaya. The symbol of two fishes depicted on the main beam under the eaves of the entrance to the queen's tomb in Kimhae, which long perplexed Buddhist scholars in Korea, was found upon virtually every house and hut in Ayodhya!

BOOK II

58. Karak-kuk[479]

[From the beginning of the creation, there was no national name and no king in the Kimhae region (north of the Naktong River delta). Nine chiefs

Ado-kian, Ypdo-Kan, P'ido-kan, Odo-Kan, Yusu-kan, Yuch'on-Kan Sinch'on-Kan, Och'on-Kan and Sinkwi-Kan ruled over 75,000 natives, who lived simple agrarian lives].

In the eighteenth year of the Kien-wu era of Emperor Kuang Wu of the Later Han in the year of the tiger (42 AD) on the day of the spring festival in Bathing Valley the villagers heard a strange voice calling from Kuji (Turtle's Back), the summit of North Mountain, saying "Does anyone live here?"

– "Yes," the chief replied.

– "What is this place?"

– "This is Kuji, the Turtle's Back, the highest peak of our North Mountain."

– "A heavenly god has commanded me to descend to earth, establish a kingdom, and become its king, and therefore I am here. You people must dig in the earth on the peak, while you dance and sing,

'Kuha! Kuha! (Turtle, Turtle) Push out your head!
If you don't, we'll burn and eat you.'
Then you will meet a great king."

[The people did as told]

The heavens opened and a purple rope descended to the earth, with a golden bowl wrapped in a red cloth tied to the end of it. When the cloth was removed the bowl was found to contain six golden eggs, round like the sun. The people worshipped the eggs, and, having replaced the cloth, took the heavenly gifts to the house of Ado, the paramount chief, where they laid them on a table and went home to rest. When they returned at sunrise and removed the cloth they found that the eggs had hatched into six boys of noble and handsome appearance. All the people bowed low and offered congratulations.

The boys grew rapidly day-by-day, and after ten days the height of the boy who had hatched first had reached nine feet. His face was like that of a dragon, his eyebrows like two eight-coloured rainbows (like those of Yao, sage-king of ancient China) and his eyes sparkled with double pupils (like those of Shun, Yao's son-in-law). On the fifteenth of the same month he was crowned king with the title "Suro". He named his kingdom Karak-kuk (or Kayaguk) and the other five men became the rulers of the five neighbouring Kaya tribes.

[The kingdom of Karak-kuk lay between the Hwangsan River on the east, the Ch'anghae (Blue Sea) on the southwest, Mt. Chiri on the northwest, Mt. Kaya on the northeast and the sea to the south. Initially, the king lived simply in a temporary residence of earth and uncut reeds, but soon after his coronation decided to build a capital in a valley surrounded by hills].

"Beautiful and wonderful!" the King exclaimed. "Though small and narrow as a blade of grass, this place is fit to be the abode of the sixteen Nahans (disciples of Buddha) or the seven sages (Legendary Chinese philosophers). With proper development of the surrounding country, this will make a fine place for people to live." And he selected the locations of the outer city walls, the royal palaces, government offices, armouries and storehouses before returning to his temporary headquarters.

[The project was completed within one year].

In the twenty-fourth year of Kien-wu of Kuang Wu-ti in the Later Han period in the year of the monkey (Mu-sin, 49AD) on the twenty-seventh day of the seventh month, the nine chief courtiers of King Suro repaired to the palace and were received in royal audience.

"It is not good for the King to be alone," they said, "Let Your Majesty choose the most beautiful and virtuous maiden from among the girls whom we shall bring to the palace and make her your queen."

"I was sent down from heaven to rule this land," the King replied, "and so my spouse will also descend from heaven at divine command. Sail toward Mangsan-do (Mountain-Viewing Island) in the south and see what happens."

The courtiers obeyed. When they were far out at sea, a ship with a red sail and flying a red flag appeared on the horizon, darting toward the north like an arrow. The Kaya sailors waved torches and made signs for the mysterious ship to come near. When it did so, they found that a beautiful princess was on board. The sailors escorted her to the shore, where a courier mounted a swift steed and galloped off to convey the news to the King.

The King was exceedingly glad. He commended the nine senior courtiers to meet the princess on the seashore and conduct her to the palace.

[The courtiers welcomed the princess and invited her to the royal palace].

"You are strangers," the princess modestly replied. "I cannot follow you, nor can I be so unmaidenly as to enter the palace without due ceremony."

The courtiers conveyed the princess' words to the King, and he was struck by her virgin modesty and queenly dignity. He ordered a tent pitched in front of his detached palace on a hill sixty feet south-west of the royal residence and awaited her arrival.

The princess left her ship with her suite, which consisted of the two courtiers Sin Po and Cho Kuang, their wives Mojong and Moryang and twenty slaves who carried gold, silver, jewels, silk brocade and tableware in countless boxes as her trousseau. When she reached the top of the hill she changed her brocade trousers and offered them as a gift to the mountain spirit. Then she approached the tent and the King rose to meet her…

"I am a princess of Ayuta (in India)," the princess said. "My family name is Ho, my given name is Hwang-Ok (Yellow Jade), and I am sixteen years old. In May this year my royal father and mother said to me, "Last night we had a dream, and in our dream we saw a god who said, 'I have sent down Suro to be King of Karak, and Suro is a holy man. He is not yet married, so send your daughter to become his Queen." Then he ascended to heaven. It is the command of the god, and his words are still ringing in our ears. My daughter, bid farewell to your parents and go.' So I started on my long voyage, with steamed dates of the sea and fairy peaches of heaven for my provisions. Now I blush to stand in your noble presence."

"I knew that you were coming," the King told her, "so I refused all the maidens whom my courtiers recommended as my spouse. Now my heart leaps with joy to receive a most beautiful and virtuous princess as my Queen."…

On the first day of the eighth month the King and his Queen entered the royal palace in colourful palanquins, accompanied by courtiers in carriages and on horseback and followed by a long train of wagons laden with trousseau which the princess had brought with her from India. She was escorted into the inner palace, and the two courtiers and their wives who had accompanied her from India were accommodated in separate apartments. The rest of her suite were given a guest house of twenty rooms and given food and drink, and her household articles and precious jewels were put in a store-room for her use at all times.

The marriage of the King and Queen was like the combination of two harmonious beings – heaven and earth, sun and moon, *yang* and *yin*. She was a faithful and true helpmeet to the King, shining like a ruby or a

sapphire – and indeed she was an Indian jewel and rendered valuable service in the rise of his royal household, like the vassals who assisted the King of Hsia[480] and the two daughters of Yao who attended Shun, their royal husband, in ancient China.

The royal couple lived happily for many years. In due time they both dreamed of seeing a bear, and sure enough the Queen conceived and bore a son. This was Crown Prince Kodung.

On the first of March in the sixth year of Chung-p'ing in the reign of Ling-ti, the year of the snake, Kisa (189) the Queen died at the age of one hundred and fifty-seven. The people mourned as if they had lost their own mothers and buried her on a hill northeast of Kuji. They changed the name of the beach where she first landed to Chup'och'on, that of the hill on which she changed her brocade skirt[481] to Nunghyon, and that of the seacoast where she waved her red flag at the shore to Kich'ulpyon, so that her arrival in Karak should always be remembered.

Sin Po and Cho Kuang, who attended the Queen on her voyage from India, each begat daughters about thirty years after their arrival, and both died a few years later…

The King spent many lonely hours in deep grief after the death of the Queen, and at last he also died ten years later at the age of one hundred and fifty-eight, on the 23rd of March in the fourth year of Kien-an during the reign of Hsien-ti in the year of the hare, Ki-myo (199).[482] The people wailed as if heaven had fallen and buried him in a mausoleum ten feet high and 300 feet in circumference to the northeast of the palace. A shrine was erected and sacrifices were offered annually on the third and seventh of January, the fifth of May and the 15th of August to the spirits of King Suro and his royal descendants for nine generations.

❑

.

ANNEXURE — 1

LIVES OF EMINENT KOREAN MONKS

HYEOP[483]

Sok Hyeop was a serene and profound man, solid in spiritual matters. Early in life he bade farewell to his remote country and went directly to the Middle Kingdom. During the era *chen-kuan* he travelled to the Western Regions, crossing the vast desert and the steep ridges of the Himalayas, suffering tremendous hardships. He took his life lightly for the sake of the Law, his only ambition being its propagation. At last he arrived at the Bodhi monastery and worshipped the sacred traces. He then stayed in the Nalanda monastery. He studied the *Vimalakirtinirdesa*, compared it with the T'ang translation, and expounded it thoroughly and systematically. The marginalia to the *Liang lun* reads: "A Silla monk, Hyeop, copied it under the Buddha's toothwood tree (*Dantakastha*)." Hyeop died at Nalanda, in his sixties; the texts he copied in Sanskrit are still in the monastery.

HYERYUN

Sok Hyeryun was a native of Silla; his Sanskrit name was Prajnsvarman (Chinese, Hyegap). From the time he left his family to become a monk, he yearned for the holy land. Finally, he sailed to Min and Yueh (modern Fukien), walked to Ch'ang-an, suffering cold and heat and all manner of hardships. Then, by imperial order, he went to the West as an attendant to the master of the Law, Hyonjo. Arriving in India, they made a pilgrimage to the miraculous traces of Buddha. Hyeryun stayed at the *Cinaccavihara* in Amravati for nearly ten years before moving east to the wealthy *Gandharachand* monastery. Most foreign monks from the north [Serindia] usually resided there, each studying his own discipline. Hyeryun knew Sanskrit well and studied the *Abhidharmakosa* deeply. I-ching noted that Hyeryun was around forty years old when he (I-ching) returned to China.

ARYAVARMAN

Sok Aryavarman possessed supernal wisdom, being self-enlightened. Coming to China from Silla in search of a good teacher to study under, he

was determined to set a standard for his contemporaries and to save future generations. His quest led him to seek the Law in western India; he scaled the distant Pamirs, and travelled far and wide and witnessed all the sacred traces. He exhausted his funds and food, and stayed at Nalanda monastery, where he died.

At this time, the eminent monk, Hyeop, was staying in the Bodhi monastery, while the monks Hyon'gak and Hyonjo were at the Mahabodhi monastery. These four monks completed their journey during the era *chen-kuan,* having left their native country to observe Indian manners. They acquired towering reputations in the east and west and left behind an undying legacy. According to the chronology, they probably departed for India around the same time as the master Hsuan-tsang (602-664),[484] but the exact year is not known.

❑

.

ANNEXURE — 2

CHINESE MONKS IN INDIA[485]

I-ching returned to Srivijaya[486] from India, and from there dispatched the manuscript of *Chei-Kuei* and the sketch of Nalanda monastery. After Fa-hien, many Chinese monks came to India to study the Law, disregarding the risk to their lives as they took the perilous road, crossing the Great Wall, or the sea route. Those who arrived suffered for want of a Chinese monastery, which made their study of Buddhism even more difficult. I-ching wished to honour them for posterity and garnered information about more than 56 monks who were still living or had passed away, though some remained unnamed. He could personally meet only five – Wu-hsing, Tao-lin, Hui-lun, Seng-che and Chih-hung. In the first year of the Ch'ui-Kung[487] era, I-ching set off for India with the *Dhyana*-master, Wu-hsing. Till the time of his departure, no Chinese commission had been set up to find out the fate of these monks; some were from Korea.

Sramana Hsuan-chao Fa-shih was a native of Hsien-chang (modern Che-kiang) in Tai-chou; his Sanskrit name was *Prakasamati* (Chinese *Jnanaprabha*). His grandfather and father both held high posts in the Imperial Service, but he underwent tonsure at an early age.

As he grew older, he wished to visit the sacred places, and went to the capital city Lan-chou for discussions on the Buddhist *Sutras* and *Sastras*. In the mid-Chen-Kuan[488] period, in the monastery of Ta-hsing-shan of Hsien-chang, he began learning Sanskrit literature with the monk Hsuan-chang. Then he set off with a mendicant staff towards the West as a *parivrajaka*, leaving the capital city and crossing the drifting sands, the Iron gate, the snow-clad mountains, the Pamir or Onion range, till he finally reached Jalandhara (Punjab).

Surviving such a hazardous journey, he fell into the hands of robbers just before entering the city, and despairing of human assistance, chanted some sacred words. The following night he had a dream that fulfilled his desire – he woke to find the robbers fast asleep and quietly escaped. Hsuan-chao Fa-

shih stayed in Jalandhara for four years, being warmly received by the king who patronised him. He practiced the Sanskrit language and studied Buddhist *Sutras* and *Vinaya* texts, with little success.

Moving on, he spent four years in the *Mahabodhi Sangharama*.[489] He studied *Chu-she Kosa*,[490] *Chieh-tui-fa I.E. Abhidharma*[491] and the *Vinayas* of the *Mahayana* and *Hinayana* schools. From here he went to the Nalanda monastery where he stayed for three years, studying the *Chung-lun*,[492] *Pranya-mula sastra* like *Sata Sastra* etc. with the Indian monk Sheng-kuang, Vijayarasmi, and *Saptadasabhumisastra-yogacaryabhumi*[493] with Bhadanta, the virtuous preceptor, *Pao-shih-tze*, Ratnasimha. He learned the various degrees of abstract meditation to free the mind from subjective and objective bondages. Then he moved towards the Ganga, receiving hospitality from the King of Shan-pu country, north of the Ganga. He resided at the monastery of the Hsin-che (Great Faith) and other monasteries for about three years.

Envoy Wang Hsuan-ts'e[494] from the Court of the T'ang Emperor, on return to China, gave a very good report about the monk Prakasamati, prompting the emperor to dispatch people to West India to escort the monk back to the imperial Capital. The journey took them to Nepal, where the King helped monk Hsuan-chao proceed towards Tibet. There he visited Princess Wen-Ch'ang[495] who financed the journey from Tibet to China.

In September, he left Shan-pu and arrived at Lo-yang in January, traveling over 10,000 *li* in five months. In Lin-te period the Emperor gave him a long audience in the Imperial Court and sent him to Kashmir to escort an old Brahmin named Lokaditya. In Lo-yang Hsuan-chao Fa-shih met several venerable monks and debated the fundamental principles of Buddhism. He undertook the translation of the *Vinaya* of the *Sarvastivada* School with the assistance of the great *Vinayacarya* Tao and *Dharmacarya* Kuan of the Ching-ai[496] temple. Soon after, however, he set off for India in deference to the Emperor's wishes, leaving behind all the Sanskrit manuscripts in the capital.

En route, he met a Chinese envoy sent by the T'ang Emperor, who was already escorting Lokaditya. The envoy commissioned Hsuan-chao, who

told them to accompany the band of travellers going to Lata (southern Gujarat), to collect medicinal herbs for longevity. This led him to Nava Vihara in Bukhara, where he saw a washing bowl and other relics of Tathagata. Then he reached Kapisa (Gandhara-Kashmir) and worshipped the *Usnisa* of Tathagata, offering flowers, burning incense, and inscribing a *prasasti*.

Then he moved towards Lata country in Hsin-tu (Sindhu), receiving a warm welcome from the king; he stayed for four years before going to South India, from where he sent various medicinal herbs to China. As the road from Nepal to Tibet and the road through the country of Kapisa to Tuo-tie (Tajiks, Tumasik) was blocked; travel was difficult. He proceeded to the *Grdhrakuta* mountain and Venuvana, Rajagriha. At the age of sixty, he fell sick and died at A-mo-luo-p'o in Mid-India.

Tao-hsi Fa-shih hailed from an aristocratic family of Ch'i-chou (Shan-tung); his Sanskrit name was *Srideva*. From childhood he was virtuous and kind, studied metaphysics and was deeply drawn to the Buddha's faith. He had a great desire to visit Mid-India. Proceeding towards Tibet, he found the road very dangerous and turned westwards, where he encountered even more difficulties. Traversing many countries, he reached the *Mahabodhi Sangharama* where he spent a couple of years in search of Buddhist Sutras and worshipped the sacred relics of the Buddha. He visited Nalanda and Kasi. The king of An-mo-luo p'o received him with great respect. He immersed himself in the study of the *Mahayana*, Ta-ch'ang *Sutras* at Nalanda. He studied the *Vinayapitaka* and the *Sabdavidyasastra* (science of grammar). As a renowned calligraphist and literary genius, he inscribed a memorial tablet in the Chinese language on a stone slab in the monastery of Great Enlightenment; at Nalanda he left more than four hundred volumes of old and new Chinese *Sutras* and *Sastras*. Srideva was residing at An-mo-luo-p'o when he fell sick and died at the age of around fifty. I-ching came to Amraka after his death and paid respects to the room where Srideva had lived.

Shih-Pien Fa-shih, Sri Kas, was a native of Chi'chou (Shan-tung), well versed in the Sanskrit language and *Vidyamantra*.[497] He followed monk Hsuan-chao to North India and then moved to city of Amraka and received

hospitality from the king. While in the Raja Vihara, he met *Dharmacarya* Tao-hsi, who hailed from his native place. They became close friends, but at the age of thirty-five, Pien fell ill and passed away.

A-nan Alyeh-po-mo, Anandavarman was a native of Hsin-luo (ancient name of Korea). During the Chen-kuan period (of the T'ang Emperor) he set off from Kuang-hsieh in the capital city of Ch'ang-an in search of the Truth and to pay homage to the sacred relics of the Buddha. At Nalanda, he studied the Vinayas and copied a large number of Sutras. He died in the west of the Lung-ch'uan, the mango grove to the south of the Nalanda monastry, at the age of more than seventy.

Hui-yeh Fa-shih, Jnanasampada, also hailed from Korea. In the Chen-kuan period, he went to India, lived in the Bodhi monastery and paid homage to the sacred relics of Buddha. He spent a few years at Nalanda, studying Buddhism and listening to religious discourses. While checking Chinese manuscripts, I-ching discovered the manuscript of Liang-lun (Liang Dynasty, AD 502-557) at Nanking, which said that the Korean monk (Jnanasampada) Hui-yeh recorded it under the shade of Buddha's Tooth-stick tree.[498] He inquired from monks living in Nalanda and learnt that the monk had died there at the age of over sixty. Whatever Sanskrit texts he copied, remained there.

Hsuan-t'ai Fa-shih also came from Korea; his Sanskrit name was *Sarvajnadeva*. During the Yung-hui[499] period, he went to Tibet and on to Mid-India via Nepal. He visited the Bodhi-Tree, the Wisdom Tree, and studied Buddhist *Sutras* and *Sastras* diligently. He visited many sites in the eastern region. While returning, he reached T'u-ku-hun (Lap Nor), where he encountered monk Tao-his, and they continued their journey together. They moved towards the monastery of Great Enlightenment and from there to China, but nothing was heard of them thereafter.

Hsuan-k'o Fa-shih, *Paramapujya*, was from Korea. In the Chen-kuan period, he and *Dharmacarya* Hsuan-chao left for pilgrimage to the monastery of Great Enlightenment. But he fell sick a few days later and died at the age of fifty.

There were two other monks from Hsin-luo (Korea), whose names and origins are unknown. They left Ch'ang-an and reached the South Sea, journeying to Srivijaya and P'o-lu'shih, the country west of Sribhoga, where they fell ill and died.

Fo-t'o-ta-mo, *Bodhidharma* belonged to Tu-huo-shu-li. He studied *Hinayana* Buddhism. He went to Shen-chou and entered monastic life in I-fu. He was very fond of travelling and visited many places in China. In India, he met I-ching at the Nalanda monastery. Thereafter, he left for north India; he was around fifty at this time.

Tao-fang Fa-shih, the Law Master *Dharmadesa*, was a native of Ping-chou. He left home for Nepal where he stayed at the monastery of Great Enlightenment for some years as head of the temple. Later, he returned to Nepal where he stayed till the time of I-ching. He was quite indisciplined and seldom studied the Buddhist Sutras; he was quite old.

Tao-sheng Fa-shih was also a native of Ping-chou; his Sanskrit name was *Candradeva*. In the last year of the Chen-kuan period, he went to Tibet and Mid-India. He visited the Bodhi monastery and worshipped *Caitagrha* with great reverence. At Nalanda, he was the youngest student and was treated very courteously by the king. He went to the Wang-Ssu Rajavihara[500] and lived there for a couple of years, studying the principles of *Hinayana* Buddhism and the essence of the *Tripitaka*. He carried many Buddhist texts and Buddha images to his own country, but on reaching Nepal on his way back home, fell sick and died at the age of fifty.

Ch'ang-min Ch'an-shih, *Nityadaksa Dhyanacarya*, hailed from Ping-chou. In childhood itself, he accepted the tonsure and wore Buddhist robes. Desiring to be born in India, he devoted himself to a life of purity and religion, chanting the name of Buddha. He visited the capital city of Lo-yang and decided to propagate Buddhism by writing the whole of the *Prajna Sutras* in 10,000 *chuan*. Keen to go to India on pilgrimage, he went to the palace for the Emperor's permission, which was granted. He travelled all over south China, copying the *Prajna Sutra*.

Then he sailed for Kalinga (Java) and the islands of the Eastern Archipelago, planning to reach Mid-India. He boarded a cargo vessel with heavy merchandise, which got caught in a sudden storm and began to sink. The captain, a follower of Buddha, boarded the safety boat and called him to join them for safety. But Ch'ang-min refused, asking the captain to save someone else, and fervently chanted the name of Amitabha. He was more than fifty when he died.

He had only one disciple with him, about whom little was known. He received help from his companions. This story was narrated by the survivors of the wrecked ship.

Mo-to-seng-ho, ***Matisimha***, came from Ching-chao;[501] his family name was Hsing-fu. His personal name was not known. He travelled widely with monk Pien, visiting Mid-India and the monastery of Great Faith Hsin-che-Ssu. He knew Sanskrit but did not learn the Buddhist *Sutras* and *Sastras* in depth, and decided to return to his land, but died on the way back in Nepal at the age of forty.

Hsuan-hui Fa-shih belonged to the Capital City of China, and was the son of General An. He took the overland route to Northern India, entering Kashmir and receiving the job of looking after the royal elephants. Daily, the King sent food to the N*agahrada Parvata Vihara* where monk Hsuan-hui lived, and five hundred *Arhats* also received the royal hospitality regularly. It was here that the venerable Madhyantika, disciple of Ananda, converted the dragon-king. The King of Kashmir was so impressed by the pilgrim monk that he pardoned over a thousand convicts condemned to death and set them free. After living some years as a royal guest, he became disappointed over something, and left for the South.

He visited the monastery of Great Enlightenment; worshipped the Bodhi Tree; and visited the Muchalinda lake. He often climbed the Grdhrakuta mountain. He overcame many difficulties to master Sanskrit pronunciations, but acquired very little knowledge in Sanskrit *Sutras* and religious thoughts, so decided to return home. But when he reached Nepal, he died at the young age of thirty odd years, possibly from consuming poisonous herbs there.

A person went with the Chinese envoy to Bukhara by the northern route and become a monk under the name of ***Cittavarman*****,** in the *Nava Sangharama* (*Hinayana* school). Having received the precept, he declined to eat the three kinds of pure food. The master of the monastery admonished him, saying "Tathagata himself took five kinds of food considered proper for a monk. It is not a crime. Why should you not eat?" Cittavarman replied that this was not the rule observed by the Hinayanists and he could not change his old habits, the master asserted that: "I have established a practice here in agreement with the three *pitakas*; I have never read such a rule. If you so please you may find out a suitable preceptor. I can no longer be your preceptor." Thus forced to eat the food, Cittavarman was reduced to tears. He knew very little Sanskrit. He took the northern route back to China, and no one knew where he went. His story was told by Indian monks from North India.

Two monks in Nepal were the children of the wet nurse of the princess of Tibet. They left home young to become monks, though one later returned to family life. They lived at the Rajavihara, and mastered the Sanskrit language and Sanskrit texts. One was thirty-five and the other twenty-five.

Lung Fa-shih *Gauravadharma* left home during the Chen-kuan period and took the northern route to India. He wanted to witness the transformating influence of Buddhism in Mid-India. He recited *Saddharmapundarika Sutra* in Sanskrit beautifully. He died on reaching Gandhara, according to monks coming from North India.

Ming-yuan Fa-shih came from the city of Ch'ing in I-chou;[502] his Sanskrit name was *Cintadeva*. He was given a religious education from childhood, and grew up virtuous, handsome, respectful, and dignified. He was respected in China, and was conversant in *Madhyamika* and *Satasastra* respectively. He could expound the discourse of philosopher Chuang-chou. While young, he visited many places in Hu-nan and in the area east of Yang-tze river valley. Later, he probed the Buddhists *Sutras* and *Sastras* and practiced meditation, spending the summer retreat in a lonely top of mountain Lu.

As Buddhism was already in a decadent state, he determined to restore its glory, became a mendicant and sailed to Chiao-chih.[503] He crossed the sea to K'o-ling and on to Simhala (Sri Lanka). When the King of the country was worshipping, he tried to steal the famous Tooth-relic to take back to his own country, but was detected and humiliated. Ceylonese sources say he moved to South India and while going to the monastery of Great Enlightenment, passed away. His age was not known. Following this incident, the King of Ceylon kept the Tooth-relic in a well-guarded and lofty tower for safety.

I-lang Lu-shih, ***Arthadipta***, came from Ch'eng-tu (Szu-ch'uan) in I-chou. He was knowledgeable in *Vinaya* and the interpretation of Yoga System. He set off from Ch'ang-an with **monk Chih-an** and **I-Hsuan**, for pilgrimage. They reached Wu-lei (Ch'in-hsien) and took a merchant ship to Fu-nan, and reached Pegu in Lower Burma where they were received by the king. The fellow monk Chih-an fell sick and died; Lang and his fellow companions sailed for Ceylon where they secured new religious texts and worshipped Lord Buddha's Tooth-relic. He then reached the Western country. I-ching collected this information; but no more could be learnt about his whereabouts.

Hui-ning Lu-shih, ***Mahabhisayanavinayacarya***, also hailed from Ch'eng-tu in I-chou. He was a very intelligent child, and visited visited temples and monasteries in pursuit of knowledge even as a young boy. He renounced the world and joined the Order (*pravrajya*), studying the Buddhist Sutras, *Sastras* and *Vinaya* canons. His quest for the Buddhist Law took him to the Western country. In Lin-te period (AD 665)[504] he reached the South Sea and sailed for K'o-ling, where he lived for three years with monk Jnanabhadra. He translated a portion of the *Agama Sutra*[505] with Jnanabhadra, concerning the last ceremony held after the *Mahaparinirvana*[506] of Tathagata. This work is different from *Nirvana* of the *Mahayana* Sutra. I-ching could find the *Nirvana Sutra* of the Mahayana comprising 25,000 *slokas*. More than sixty *chuan* were translated into Chinese; he wanted to collect the entire *Sutra* but failed; he got a collection of the first 4,000 *slokas* of the *Mahasanghika*.

Hui-ning translated the *Agama Sutra* only. He asked his disciple monk Yun-ch'i to go to China and present the *Sutra* with respect; he returned to Chiao-fu (Kuang-tung) from where it was taken by horses assigned by the Government. Yun-ch'i presented the book to the Emperor and requested him to propagate this book among the people of Tung-hsia (China). Yun-ch'i left the capital and reached Chaio-chih; he announced that he received a gift of hundred pieces of fine shining silk from the Court.

When he returned to K'o-ling he reported to Jnanabhadra that the monk Hui-ning wanted to meet him. But Hui-ning set off for the Western country. Yun-ch'i waited anxiously for Hui-ning, sending messengers to five Indies in search of him, in vain. Hui-ning travelled alone in search of Dharma. But in the very first leg of his travel, at Pao-chu (Ratnadvipa), he died at the age of thirty-four or five.

Yun-ch'i, ***Kalacakra***, was a native of Chaio-chou. He **travelled with T'an-rung**. He was ordained by Fu-chih-hsien. He acquired some knowledge of Sanskrit, but later retired to lay life and lived in Sri-vijaya up to the time of I-ching. Then, he was again moved by the Law of Buddha and again travelled over the island preaching the faith among non-believers. He breathed his last at the age of forty.

K'uei-ch'ung Fa-shih from Chiao-chou was a disciple of Ming-yuan; his Sanskrit name was *Citradeva*. He took a ship to Ceylon, whereafter he moved to western India, where he met the venerable monk Hsuan-chao and went to Mid-India with him. He was honest, sincere and intelligent, and proficient in reciting Sanskrit *Sutras*. He assiduously collected Sanskrit *Sutras* and recited them with tunes and actions. He paid homage to the Bodhi tree, and dwelt at length at the Bamboo Grove in Rajagrha. Here he fell sick and died at the age of thirty.

Hui-yen Fa-shih, ***Prajnaratna***, native of Chiao-chou, was a **disciple of Hsing-kung**, with whom he went to Simhala. Nothing is known of him thereafter.

Hsin-chou Fa-shih's native place is unknown; his Sanskrit name was *Sraddhavarman*. He took the northern route to India and lived in the

Monastery of Faith. Here he built a brick chamber and donated it for the use of those who retired from the cares of public life. Here he fell sick and just before his death one night he cried out that *Bodhisattva* with outstretched hands was beckoning him to his beautiful abode. He stood up with folded hands and breathed his last at the age of thirty-five.

Chih-hsing Fa-shih was a native of Ai-chou; his Sanskrit name was ***Prajñadeva***. Sailing from the South Sea, he reached West India and worshipped the sacred relics of the Buddha. He then went to the north of the river Ganga, dwelt in the Monastery of Faith and died there at the age of fifty.

Ta-ch'eng-teng Ch'an-shih also hailed from Ai-chou; his Sanskrit name was ***Mahayanapradipa***. While still young, he sailed for Dvaravati, ancient capital of Siam, with his parents and here became a monk. Thereafter, he followed T'an-su, envoy from the Imperial Court, and reached the capital. He lived in the monastery of Tz'u-en,[507] *Mahakaruna*, the great compassion monastery where the *Tripitaka* master Hsuan-chuang lived. Here Mahayanapradipa was ordained to the Buddhist faith. For some years, he studied the sacred Buddhist *Sutras* here, and nurtured a desire to visit India.

Carrying Buddhists images, *Sutras and Sastras*, he crossed the South Sea and reached Ceylon where he worshipped the Buddha's Tooth. Moving through South India he reached Eastern India and proceeded towards Tamralipti (Tamluk, W. Bengal). At the river, his boat and other valuables were robbed, but the pirates spared his life. At Tamralipti, he devoted twelve years to perfect himself in Sanskrit *Sutras*. He studied the *Nidana Sutra* and other important texts and entered into an ecclesiastical life.

He joined a group of merchants and **with the venerable I-ching** reached Mid-India, where they first visited Nalanda, then Bodhimanda and Vaisali, and finally Kusinagara. **Dhyana master Wu-hsing** visited these places with them.

It was his ambition to achieve Dharma and propagate it in China, and as he neared his end, he wished to accomplish this in his next life. He

expressed a desire to visit the home of Maitreya, daily drawing the picture of one or two branches of *Nagapuspa* (dragon flower) to express his sincerity. He lived in the old room of the monk Tao-his, who had already died, and whose Chinese and Sanskrit texts on Buddhist *Sutras* and Sastras were still present there. Looking at the books, he shed tears as they had previously always moved together, discussed Dharma together at Ch'ang-an, but could not meet in this foreign land. The Dhyana master died in the *Parinirvana Vihara* in Kusinagara.

Seng-chia-p'mo *Sanghavarman* was a native of K'ang-kuo, Sogdiana (Kirghiz). A wanderer from childhood, he walked through drifting sand and reached the Imperial city. He had a great passion for religion. During the Hsien-ch'ing[508] period, the Emperor ordered him to go on pilgrimage to the Western country along with the imperial envoy. At the monastery of Great Enlightenment, he paid homage to *Bodhimanda*. He lit the lamp for seven days and seven nights as offerings to the Council of discourses on Dharma, and under the Asoka tree in the courtyard of Bodhimanda he carved images of Buddha and *Bodhisattva* Avalokiteswara.

On his return to China, he was again sent to Chiao-chih to collect medicinal herbs at a time when the region was under the grip of severe famine and people were dying without food. He prepared and distributed food to the famine-stricken people daily. Because of his compassion he came to be known as 'Weeping Bodhisattva incarnate'. Some time later, he fell sick and died immediately at the age of sixty.

Pi-an Fa-shih *Dharmacarya Nirvana* and **Chih-an Fa-shih (*Jnanaparin*)** were both natives of Kao-ch'ang, Turfan (Central Asia). They went to the capital city to become monks, and were keen to visit Mid-India and to witness the transforming influence of the Doctrine there. They boarded a ship with the Chinese envoy Wang Hsuan-k'uo, but fell sick on board and died. Their copies of Buddhist *Sutras* and *Sastras* in Chinese translation, including texts on *Yoga*, were left in the country of Srivijaya.

T'an-jun Fa-shih, *Meghasikta*, was from-Lo-yang; he had deep knowledge of the art of exorcism and of metaphysics. He studied the *Vinaya* texts and practiced *Cikitsa Sastra* (science of medicine), and displayed a

keen desire to serve all living creatures. He sailed the South Sea and reached Chiao-chih where he stayed one year before sailing for West India. He reached K'o-ling, fell sick and died at the age of thirty at Po-p'en (Pempuan, Borneo).

I-hui Lun-shih, ***Artharasmi Sastracarya***, was a native of Lo-yang. An extraordinarily brilliant man, he strove for scholarship and Truth, listening to discourses on *Samparigraha Sastra, Kosa* etc. and acquired deep knowledge. Noting much discrepancy in the texts, he wished to see the original Sanskrit texts and personally hear the meanings. He came to Mid-India hoping to return to China, but died on arrival at Lang-chi, at the age of thirty odd years.

Three other Chinese monks took the northern route and reached Udyana country where they worshipped the relics of the Buddha's skull. Their whereabouts were not known thereafter, and I-ching learnt of them from monks coming from Udyana.

Hui-lun-shih was a native of Hsin-luo; his Sanskrit name was *Prajnavarman*. He renounced the world while in his hometown and set off on pilgrimage to the famous shrines of his faith. Arriving at Min-yeh (Che-kiang) in China, he travelled a long distance to Ch'ang-an, and received an imperial order to follow Hsuan-chao who had gone to the Western countries, find him, and assist him there. In India, he lived in the Monastery of Faith in the city of An-mo-luo-pa (Amravati) for nearly ten years. Moving east he visited Gandhara Sanda (Tukhara *Sangharama*), built to accommodate Buddhists monks from Tukhara. It was one of the richest *Sangharamas*. Hui-lun stayed there to study Sanskrit and *Kosa*. He was forty years old when I-ching met him there.

West of this monastery was the *Gunacarita*[509] monastery, for the people of Chia-pi-shih. It was renowned for its prosperity, moral virtues, and high standards of learning. The monks were Hinayanists.

Nearly forty yojanas east of the Nalanda Vihara, downstream of the Ganga, was Mrgasthapana, the Deer Park monastery. Nearby was another monastery in ruins, known as the Chih-na or Chinese monastery. It had been built by the great king Sri-Gupta. During his visit there were more

than twenty monks from China. They came via Ko-yang, through Shu-ch'uan (modern Sze-ch'uan)[510] and reached the *Mahabodhi Sangharama*. The King received them great respect and made an endowment of twenty-four villages for their maintenance. Later, all the Chinese monks died, and only three villages remained in the possession of the *Mrgasthapana* monastery. Five hundred years had elapsed since the Chih-na monastery was built. The Chin-kan-tso, *Vajrasana* and *Mahabodhi* temple were built by the King of Ceylon, and monks from Ceylon always stayed in this temple.

Tao-lin Fa-shih was a native of Chiang-ling in Ching-chou (Hunan); his Sanskrit name was ***Silaprabha***. He renounced the world at a very young age and resolved to become a Buddhist monk. At the age of twenty, he sought an able teacher, collected the *Vinaya Pitaka*, controlled his passions and spent most of his time in mediation. He seldom rested, spending the major part of the day and night in study; he took just one meal a day. Though Buddhism had come to China long ago, the Intuitional School[511] had just begun; nevertheless, the canonical texts stressing the importance of monastic discipline were rare. He thought of going to India to procure the sources and the history of the *Vinaya Pitaka* and set sail from the South Sea. He passed through copper pillar T'ung-chu and arrived at Lang-chia; crossed Ho-ling and Luo-kuo (Nicobar) and reached India, where he was warmly received by the kings of the countries he passed through. Spending some years there, he reached Tamralipti in East India and devoted three years in studying Sanskrit language.

Tao-lin rejected the old precepts, accepted the important ones and studied the *Vinayas* of *Sarvastivada* school. He studied the canonical rules of *Vinaya* and tried to make a synthesis of Knowledge with *Dhyana*-meditation. He scrutinised carefully the *Dharani Pitaka.* He witnessed the changing influences of the Law in Mid-India, paid homage to the sacred shrines of *Bodhimanda*, and went to the Nalanda monastery to learn the true significance of the *Mahayana Sutra* and *Sastras.* He lived there for many years to completely master the *Abhidharma Kosa.* Then he went to the Vulture's Peak mountain, *Yastivanagiri*[512] and Wild Goose Forest.[513] He travelled all over South India in search of monk Hsuan-mu.

Proceeding to West India, he spent nearly a year at Lata country where he established an altar and learnt Ming-chu[514] Vidya (*Vidyadhara Pitaka*). The Sanskrit text reputedly contained 100,000 *slokas*; possibly the Chinese translation comprised three hundred *chuans* (chapters), most of which were lost at the time of I-ching. After Buddha's *Mahaparinirvana*, Nagarjuna Bodhisattva preserved its true spirit. As this *Dharani Pitaka* was never very popular in China, Tao-lin desired to protect this mysterious *Sutra*. Tao-lin proceeded towards North India and witnessed the transforming influence of Buddhism in Kashmir. Arriving at Udyana, he sought proper guidance for meditation and collected the *Prajna -Sutra.* He worshipped the sacred lotus skull, *Usnisa* (cranium of the Buddha).

T'an-kuang Lu-shih, *Krsnamegharasmi* hailed from Chiang-ling in Ching-chou. He renounced the world and his native place and went to the capital city where he became a disciple of *Vinaya* master Ch'eng. T'an-kuang had a refined literary taste and was an eloquent speaker. He studied the classics of his own country and of other countries and observed the canonical rules of discipline.

Crossing the ocean to worship the sacred relics of Buddha, he first arrived in West India and there went to Harikela (*Chandradvipa*, Bakharganj, Bangladesh). At Harikela, aged fifty years, he met a monk from the land of the T'ang rulers. He was warmly received by the king of Harikela and appointed head of the monastery there. He acquired many sacred *Sutras* in original along with Buddha images. He fell sick and passed away in a foreign land.

Hui-ming-shih, *Prajnajnapti* came from Chiang-ling in Ching-chou. He was a man of high moral principles and clear understanding, and studied the classics of China and other nations. The desire to see the sacred Nairanjana river and Venuvana inspired him and he set for Champa (Vietnam region). He suffered much due to a typhoon at sea, reached the copper pillar of Ma-Yuan, rested, and returned to China.

Hsuan-k'eue Lu-shih, ***Mahamarga***, was a native of Chiang-ning in Jun-chou (Chiang-su), and hailed from a very noble clan Hu. He was educated

in history and literature. He left home at an early age, and quickly made progress in the field of religion. He thoroughly studied the *Vinaya* texts and specialised in meditation. He observed strict discipline and regularly attended discussions on the Buddhist Sutras; he made a special study in Hsuan-I.[515] He was skilled in ancient Chinese calligraphy. He used only three garments like a Buddhist *sramana*.

Travelling widely, he reached Tan-yang, where he made an agreement with a man to go to India on pilgrimage. He reached Kuang-chou (Canton) where he came down with pneumonia and returned disappointed to his native place; he was only twenty-five or twenty-six years old.

Shan-hsing, ***Sugati*** was a native of Chin-chou. He left home at a young age to seek the Way (Buddhism). He studied the rites on Discipline and wished to learn *Vidyamantra*, spells. He became a disciple of I-ching and followed him to Sri-vijaya. When he developed ulcers, he returned to China at the age of a little over forty.

Lian-yun came from Hsiang-yang (in Hu-pei); his Sanskrit name was ***Prajñadeva***. A man of uncommon qualities, he renounced the world when young, and determined to pay homage to the sacred relics of Buddha. He accompanied monk **Che** and reached India by sea. He studied the Sanskrit language and commanded respect and honour from the king and the people alike. His sketch of the image of Maitreya was an exact replica of the image under the Wisdom Tree. Later, he devoted his life to the cause of Buddhism in China and had a rare ability to translate Buddhist texts.

Seng-che Ch'an-shih, *Bhiksu Darsana Dhyanacarya*, hailed from Li-chou and was inclined towards Buddhism from childhood. He diligently studied the different collections of the *Vinaya* and mastered the entire system of *Dhyana*. Keen to visit the sacred places, he set sail for India and visited many places of surrounding countries before coming to Eastern India. He reached Samatata; its king was Hu-luo-she-po-t'o,[516] a great admirer of the "Three gems" (the Buddha, the Law and the Order). The monk Che lived in the Raja-vihara to study Sanskrit; he received special honour and respect from the king. I-ching could not meet him as he arrived in the monastery after the monk had left.

Hsuan-yu, disciple of monk Che, came from Kao-li. He accompanied his teacher to Simhala where he was ordained as a monk and remained there for the rest of his life.

Chih-hung Lu-shih, *Mahaprajña*, belonged to Lo-yang, and was nephew of Wang Hsuan-t'se[517] who had been sent by the Emperor as an envoy to the Western world. From childhood Chih-hung abhorred the company of rich, frivolous and worthless people. He left home, took refuge in Shao-lin monastery (in Hu-nan) and lived mainly on roots and fruits, studying the Chinese classics; he was himself a good writer.

He became a mendicant under the guidance of preceptor Dhyanarasmi. After many years of study, he went to Ch'i-chou (Hu-pei) where *Dhyana* master Jen taught; but he was still unsuccessful in his study. He crossed the Hsiang (tributary of Yang-tze) river, the Heng-ling mountains, and entered the Kuei-lin monastery where he studied for many years under *Dhyana* master Chi. Then he acquired knowledge from the teacher of San-wu and learned from the talented scholars of Chin-chiang.

Leaving China to pay homage to the western lands, he met *Dhyana* master Wu-shing and with him reached reached He-p'u (Lien-chou, Kuang-tung) and set sail, but was stranded for a while at Sheng-ching. However, he reached Chaio-chou where he passed the summer retreat. At the end of winter, he took a ship to Sri-bhoga in South Sea, and the journey was recorded by *Dhyana*-master Wu-hsing. They spent two years in the monastery of Great Enlightenment, where he improved his language. After learning the *Sabda Sastra* (Treatise on words and their meanings), he acquired the ability to understand Sanskrit scriptures. He studied the rules and ceremonies of the *Vinaya* texts and *Abhidharma.* He could expound *Kosa* and was accomplished in *Hetuvidya* (Logic).

At Nalanda monastery he learned the *Mahayana*, and at the *Bodhimanda* he learned the *Hinayana*. He studied the *Vinaya Sutras* composed by monk Te-kuang, *Punyaprabha*, and had the talent to translate into Chinese whatever he heard. He visited Vulture's Peak mountain near Rajagrha, Mrgadava or Deer Park, Jetavana Vihara, T'ien-chieh[518] Deva Sopana, Amravana or Mango grove, and the caves for meditation. After for eight years, he went to

Kashmir, accompanied by **monk Lin-kung**. I-ching did not know what became of him, but he contributed much in translating sacred texts into Chinese.

Wu-hsing Ch'an-shih belonged to Chiang-ling in Ching-chou; his Sanskrit name was ***Prajnadeva***. He was a gentle, humble and cultured man, with a great love for learning; from childhood he frequently visited the library. At twenty, he was honoured with an Imperial officer's post Chin-ma-men (Imperial Academy) where he studied the classics of hundred schools of philosophers and three Chinese Classics.

He admired the Buddhists doctrines, and met five eminent men who helped him pursue his quest. At the Teng-chieh monastery, he started studying Buddhism with other disciples under monk Hui-ying (*Prajnavira*) of the Ta-fu-tien monastery. Prajnadeva became the best disciple of the preceptor Chi-ts'ang (*Srigarbha*).

Travelling in search of perfect knowledge and wisdom, he often studied the world of Dignaga and Dharmakirti.[519] He lived by begging alms once a day. He devoted himself to translating the *Agama Sutra* and the events of the *Mahaparinirvana* of Tathagata. Before returning to China, he completed the translation of the *Vinayas* of the *Sarvastivada school*. I-ching came from Nalanda to see him off. Wu-hsing was fifty-six years old at that time.

Dhyana-master Fa-chen *Dharmavikampana* was from Ching-chou. A sincere follower of *Dharma*, he recited the rules and precepts of the *Vinaya* and the *Sutras*. Yearning to visit the Western regions and pay devotional homage to the sacred shrines, he and two friends embarked on a ship and arrived at Sheng-ching, from there to north of K'eling, on to Kedah. Soon after, he fell sick and passed away at the age of thirty-five or thirty-six.

Ta-t'sin, the Great *Vinaya* and Law master belonged to Li-chou and joined the monastic life at an early age. He hoped to visit the sacred shrines, especially the sacred city of Rajagrha. In the second year of Yung-shun (Ch'un)[520] period, he sailed the South Sea with many companions but later they decided not to proceed further and he was left alone. He followed the Chinese envoy with Buddhist *Sutras* and images, and they reached Sri-

Vijaya Island, where they remained for some years. He could not understand the language spoken by the people of K'un-lun, but studied Sanskrit books there. I-ching met him here. He wanted to return to China to urge the Emperor to build a monastery in the West. On the fifteenth day of the second month of the third year of T'ien-shou era,[521] he sailed for Ch'ang-an. He carried with him ten *chuan* of miscellaneous Buddhist *Sutras* and and *Sastras* newly translated, four *chuan* of the *Record of the inner law or religion sent from the South Sea country through one who returns* and two *chuan* of *Memoirs of eminent monks who visited Western region or India and its neighbouring countries in search of Law*.

Pi-ch'u-chen-ku Lu-shih, the *Vinaya*-master *Bhiksu* Chen-ku was known as *Salacitta* (firm and erect) in Sanskrit. He hailed from Jung-ch'uan in Cheng (K'aifeng, Honan) and his family name was Meng. From childhood he was drawn towards Hui-yuan.[522] The death of his father when he was fourteen made him realise the impermanence of life. He decided to visit the sacred places and went to the monastery of Teng-t'ze-Ssu,[523] where monk Yuan was living at Fan-shui. He learnt to recite the Buddhist *Sutras*, but his preceptor passed away after three years.

He went to Lin-lu and other monasteries in Hsiang-chou (modern Chang-te) to seek a teacher, and went further towards the Kingdom of the Eastern Wei ruler Tung Wei[524] to study the text *Wei-shih, Vijnapimatrata*. Moving to An-chou (in P'ing-an) he studied Fang-teng[525] under the Great *Dhyana*-master Yu.

The spiritual quest took him to Hsiang-chou and *Dhyana*-master Shen-tao who taught him the knowledge of victorious deeds of Amitabha. Then he went to the monastery of Great enlightenment, the place of *Dhyana*-master Pradipa, and learnt the canonical rules. He deeply studied various *Sutras* and *Sastras*, and was a strong upholder of Szu-I *Catursarana*.[526] He was anointed with the principle of Pa-chieh, eight stages of mental concentration, *asta vimoksa* (liberation in eight forms) that greatly influenced the different sects. He was specially invited and permitted to enter the divine capital, and lived many years in the *Purvarama* Tung-

Ssu[527] under the Dynastic rule of the Wei. He was a little more than twenty years old.

***Vinaya*-master Hsiu** was the best disciple of *Vinaya*-master Hsing (*Abhyudaya*) of Shu-chun (Sze-ch'uan). At the age of twenty he was fully ordained and continued living at Sze-ch'uan studying the *Vinaya* for four years from a monk teacher. He proceeded to Ch'ang-an and stayed for sixteen years with monk Hsuan. He immersed himself in the study of numerous schools of thought. Then he went to San-yang in Pa-shui, from there he went to Kuang-chou, his birthplace, to report his achievements. He moved to An-chou and taught the *Vinaya*. The princes showed him honour and respect. He lived in the *Dasabala* monastery and went to the abode of peace at the age of little more than seventy.

The monk Ku obtained the Vinaya texts and studied them, besides the Sutras and Sastras. He recited thousand times the *Saddharma Pundarika Sutra (*Lotus Sutra) *and Vimalakirtinirdesa Sutra* and followed the canonical rules. Though he believed in *karma*, he was equally interested in observing the four ceremonies Szu-i.[528] He went to Hsiang-chou and heard discourses on the *Sutras* (sermons of Buddha) and searched for the mystery *Abhidharmapitaka.* Crossing river Hsiang-shui, monk Ku went towards Lu-shan and lived in the Tung-lin monastery.

Keen to visit Ceylon and glimpse Buddha's Tooth and other sacred places, he went to Kei-lin in the Ch'ui-kung period.[529] He reached P'an-yu in Canton, where Buddhist disciples urged him to teach the *Vinaya* treatises.

Monk Ku wished for a life of rest and meditation in a monastery and to propagate the purity and richness of *Astavimoksa*, eightfold path of liberation. However, at the age of forty, at the invitation of I-ching, the monk agreed to travel with him. On the first day of the eleventh month (AD 689) they sailed by merchant ship for Fan-yu (in Canton), advanced towards Champa and hoped to reach Sri-vijaya. The duo reached Chin-chou (*Suvarnadvipa*). On reaching Sri-vijaya, he listened to discourses on religion which he had never heard before and observed practices and customs he had never seen before. He translated many texts and acquired much knowledge.

Monk Chen-ku had a disciple, Hsuan-yeh, whose family name was Meng and **Sanskrit name was *Sangadeva*.** Though his grandfather hailed from the north, he lived in the south as an Imperial officer; so the family also shifted to Kuang-fu. Hsuan-yeh was predestined to study Buddhism, and sailed for Sri-vijaya. He understood the local language of K'un-lun, studied Sanskrit books and chanted the *Abhidharma Kosa* verses and other Buddhist hymns. He became an attendant, and an interpreter. He was seventeen years old (in three editions it is 70 years old).

Bhiksu Tao-hung, ***Buddhadeva***, belonged to Yung-ch'iu in Pien-chou (K'ai-feng in north Honan) His family name was Chin. His father served a merchant and the family travelled extensively. He went to *Dhyana*-master Chi to study the mystery of the soul, and acquired knowledge about the essential meaning of the doctrine. Then he went to Hsia-shan. Tao-hung left home and became a monk, acquiring some knowledge in all branches at the age of twenty. He left for Kuang-fu and entered the Buddhist monastery.

Hearing of I-ching's arrival, he went to visit him at the Chih-chih monastery, where he discovered they had common ideals. He returned to Kuang-fu with monk Chen-ku, and thereafter embarked on a voyage to the South Sea and reached *Suvarnabhumi* to copy the *Tripitaka* so he would be remembered for thousands of years. Arriving in Sri-vijaya, he devotedly studied the *Vinaya Pitaka* and translated Buddhists texts and took notes on scriptures to propagate Buddhism. He was only twenty years old.

Pi'ch'iu Fa-lang, ***Dharmadeva***, a native of Hsing-yang in Hsiang-chou (Hu-pei province) lived in the temple of Ling-chi (Spirit temple). His surname was An-shih. He came from an enlightened aristocratic family which traditionally held high offices in the Imperial services. At young age he left home to enter the ecclesiastical life.

Lang desired to travel with I-ching on his sea-voyage, and a month later they arrived at Bhoga. Lang concentrated on the study of *Hetuvidya* and the mystical and abstruse doctrine of *Abhidharma*. He devotedly studied the *Tripitaka*, yet never shirked manual labour. He lived on alms and scrupulously observed the important ceremonies and rituals. He was only twenty-four years old.

The monk Chen-ku and four others also arrived in Sri-vijaya. He spent three years at Sri-vijaya, studied and acquired proficiency in Sanskrit and Han (Chinese) literature. After some time, monk Lang left for K'o-ling, where he passed the summer, fell sick and died.

Chen-ku and Tao-hung preferred to stay at Sri-vijaya and did not return to Fan-yu, but the rest of the monks went back to Kuang-fu. Chen-ku went to the *Tripitaka Dharmamanda* and widely taught the *Vinaya*. Tao-hung returned alone and spent the rest of his days in the South. No news was available about Tao-hung after that; I-ching occasionally wrote to him, but there was no reply from the other side.

The remains of the town still exist—23° 55’ N., 35o 34’E.

[←18]

In April 2004, archaeologists of the Centre for Heritage Studies, Thripunithura, excavated six copper coins and nearly 100 beads of the Adi Chera (Sangam) period from Pattanam, near North Paravur, Kerala. Previous excavations had yielded fragments of Roman amphora, rouletted wares and beads of semi-precious stones and glass, indicating the ancient port town of Muziris could have been in this vicinity rather than near Kodungalloor as popularly believed. Prof. M.G.S. Narayanan noted this was the first time Adi Chera era coins were excavated from Kerala. Hitherto, the State's historical connection with Muziris and the Adi Chera empire was restricted to references in Greek and Tamil literature and inscriptions.

[←30]

Scholars feel this is at odds with Greek brutality in other battles, notably Massaga, where Alexander violated the pact with the Queen and massacred nearly 7000 mercenaries whose safe passage had been negotiated. This was condemned as treacherous by Plutarch and Diodorus Siculus; Arrian defended it calling the mercenaries unreliable. The battles of Nysa, Sangala, and all fights on the return journey were equally brutal. See also Cartledge, Paul, Alexander the Great: The Hunt for a New Past. London: Macmillan, 2004: 183-94, cited in Garton, Stephen, in Memory As History, op. cit., 2007:11.

[←31]

I am indebted to Prof. Madhavan Palat for this insight.

[←32]

In the battle with Porus, Arrian claims almost 20,000 Indian infantry and 3000 cavalry were killed, as were the two sons of Porus, Spitaces, governor of the district, and several officers and generals of Porus' army (Chapter XVIII). The Macedonians lost only 80 of 6000 foot-soldiers, 10 horse-archers, 20 Companion cavalry, and about 200 other horsemen. If these figures are true, how does one account for the sheer decimation of the Greek forces that retreated from India?

[←33]

Curtius Rufus, Alexander the Great, Book IX, Chapter I.

[←34]

This suggests impoverishment of the army at this stage.

[←35]

Possibly the experience with Indian war elephants forced the Greeks to retreat; the war-fatigue of the army was thought up by Greek historians many centuries later, under the Roman Empire.

[←36]

I owe this insight to Prof. Lokesh Chandra.

[←37]

Ray, Himanshu Prabha, Alexander's Campaign (327–326 BC): A Chronological Marker in the Archaeology of India, in Memory As History, op. cit., 2007:106.

[←38]

Ray, Himanshu Prabha, ibid., p. 105-7.

[←39]

Nearchus' memoirs are now lost, but their contents are largely preserved in the works of Strabo and Arrian.

[←40]

Salles, Jean-François, ‘Travelling to India Without Alexander’s Log-books’, in Memory As History, op. cit., 2007:157-8.

[←41]

Nearchus' account makes it abundantly clear that the Greeks were in flight, unwilling to undertake further risks in India.

[←42]

The Indus Valley civilisation had developed a script many centuries previously, though it remains undeciphered to this day. Even Panini, who precedes Ashoka, mentions the written word.

[←46]

Interested readers can find the complete versions in the collections of J.W. McCrindle, R.C. Majumdar, and others.

[←47]

The Classical Accounts of India, R.C. Majumdar, Firma K.L. Mukhopadhyaya, Calcutta, 1960 and Ancient India as described in Classical Literature, J.W. McCrindle, First Indian ed. 1879 (rpt. 1901- Westminster), Oriental Books Reprint Corporation, New Delhi.

[←48]

Freed from paying taxes in lieu of the costs incurred in feeding the dogs.

[←49]

McCrindle believes this tribute was levied on countries west of the Indus as Persian power never extended beyond the Punjab and the lower Indus Valley. In Alexander's time it was bounded by that river. See McCrindle, op. cit.

[←50]

Hekataeus called Kaspapyrus a city of the Gandarians; Sanskrit Kasyapapur; some think it was Kashmir.

[←51]

Forerunners of the modern Pashtuns, Pathans.

[←52]

People of northern Afghanistan.

[←53]

Repeated by Megasthenes and Nearchus, who even claimed to have seen in India the skin of a gold-digging ant, possibly the skin of a marmot or other burrowing animal. McCrindle cites Dr. Wilson that the Sanskrit name for alluvial gold (gold dust) is paippilaka ("ant-gold," a reference to its size and form). Unable to grasp this symbolism, the Greeks gave it a literal meaning. The Mahabharata speaks of 'that gold which is dug up by Pipilakas (ants) and is therefore called Pippilikas (ant-gold).' Pippilikas may have been Tibetan miners as Megasthenes says the gold was carried away from the Derdai (people of Dardistan). Sir H. Rawlinson and Dr. Schiern of Copenhagen, learning of the customs of Tibetan gold-miners, concluded that the myrmeces of Herodotos and Megasthenes were Tibetan miners and their dogs, which can be identified with griffins – From a Paper read before the Royal Irish Academy, June 9, 1884, by Prof. V. Ball, Director, Science and Art Museum, Dublin.

[←54]

An error based on the silky fibres of the seed of gossypium arboreum (tree-cotton); used for padding cushions, pillows.

[←55]

Skylax probably sailed on the Hydaspes (Jhelum). As he was Herodotus' countryman, there is no reason to doubt, as some scholars have, that the voyage actually took place.

[←56]

Son of Darius I and grandson of Cyrus, founder of the Persian empire.

[←57]

For a complete translation of his surviving fragments, see U.P. Arora's Greeks on India. Skylax to Aristoteles, Indian Society for Greek and Roman Studies (ISGARS), Bareilly, India, 1996.

[←58]

Lassen suggests this passage means that auriferous ores were melted to obtain liquid gold. The spring must be an error, but there must have been a cistern to receive the gold. A pitcher need not be very large to contain one talent (approx. 53 pounds) of gold. This suggests Indians knew how to extract gold from ore by melting.

[←59]

Probably the magnet, whose properties were not properly known then.

[←60]

For unknown reasons this myth was already prevalent among the Greeks. Later, Alexander's historians located it in the realm of king Sopithes.

[←61]

Obviously incorrect.

[←62]

The bamboo can attain a height of sixty feet and may be two feet in diameter. Ktesias was the first to record that there are male and female reeds and that only the female had a pith, while the male was stronger and more compact. The same reed is mentioned by Herodotus (III, 98).

[←63]

Some think this uninhabited region was the Gobi desert; others believe the great desert east of the Indus where sun worship flourished in early times, which was also about fifteen days' journey from the mountains which produced onyx and sardine stones. Some think it is in the Vindhyas.

[←64]

Obviously a forest tribe; the claim that hair was so long as to substitute for clothes is, of course, fictitious.

[←65]

Indian silver mines occur only in Udayapura in Ajmer; Badakshan in the upper Oxus valley is rich in silver.

[←66]

Narratives like this gave Ktesias his bad reputation! See footnote 53 for an explanation.

[←67]

Lassen says this passage is remarkable because the Chinese pilgrim Fa-Hien noted something similar about Udyana, west of the Indus and north of Peshawar. Pliny mentioned an Indian plant (Hist. Nat. xxiv, 102). Guilty persons who swallowed pills prepared from its roots and mixed with wine were tormented by night visions and confessed their sins. No doubt some drink was used for judicial purposes.

[←68]

A misunderstanding based on some mythological tale or an excessive admiration for India.

[←69]

They appear to be a real tribe, despite the fictitious properties given to them. They probably kept big dogs for hunting wild oxen and other wild animals, and hence the confusion about them.

[←70]

A slightly inaccurate description of the cochineal insect.

[←71]

Obviously a talented tribe of cattle-herders, reputed for collecting forest produce, hunting and archery, and making weapons of war. The men obviously served the king in times of war; a common phenomenon in India.

[←72]

Indians were reputed for their sense of justice and Ktesias was deeply impressed by this fact.

[←73]

This could be the rhinoceros, though the colour and other details do not match.

[←74]

This suggests the rhinoceros despite certain errors in the narrative.

[←75]

Five kilos.

[←76]

Aelian gives more details. Lassen says Ktesias' report is the corruption of an ancient Indian idea based on the worship of snakes which was particularly current in north-western frontier region (vol. II, p. 468). It is probably based on the story of a fire-weapon lent to man by a serpent-god, which he depicts as real.

[←77]

Ktesias' description, though somewhat exaggerated, suggests the product was cinnamon oil.

[←78]

Balada in Sanskrit means ‘giving strength’; applies to a bullock and a medical plant (Physalis flexuosa).

[←79]

Ancient India as described in Classical Literature, John W. McCrindle, First Indian ed. 1979 (rpt. 1901- Westminster), Oriental Books Reprint Corporation, New Delhi.

[←80]

The kingdom of Pandion lay in the extreme south and was founded by the family of Pandu, father of the five Pandava brothers of the epic Mahabharata. The king and his capital were both named Madura (Mathura) after the celebrated north Indian city. The kingdom is mentioned by Pliny, by the author of the Periplus of the Erythroean Sea, and by Ptolemy. In the "Contemporary Review" of September 1891, Sir M.E. Grant Duff mentions a Roman coin – the Aureus of Claudius – found in Madurai district and now in the Madras museum, struck to commemorate the conquest of Britain! Duff himself had a coin of the Arian Emperor Valens, found in Madurai's Vaigai river.

[←81]

Three princes were called Porus in the Greek classics: (i) The great Porus defeated by Alexander on the banks of the Hydaspes (Jhelum); (2) a contemporary kinsman of Porus, who ruled a district east of the Hydraotes (Ravi); (3) the Porus here mentioned. They were descendants of king Puru of the Mahabharata.

[←82]

The Greeks believed India was limited to the eastern side of the Indus. But the name sometimes covered regions between the Indus and the Hindukush mountains and Paropanisos (see Pliny, vi. 23) as many names of tribes, mountains and rivers of Northern Afghanistan, as given by Alexander's historians and Ptolemy's Geography, were of Sanskrit origin.

[←83]

A reference to Seleukos Nikator's surrender to Sandrokottos of provinces westward of the Indus.

[←84]

India has two distinct species of cotton, gossypium herbaceum, which is woven into cloth, and gossypium arboreum or tree-cotton, which yields a soft and silky texture used for padding cushions, pillows, etc.

[←85]

Seric fabrics were silk-webs imported from the northern provinces of China.

[←86]

The reference is to sugar-cane. The author of the Periplus mentions honey from canes called sakkhar (Sanskrit sarkara, Prakrit sakhar).

[←87]

Mousikanos was a flourishing kingdom in Upper Sindh; now the ruins of Alor.

[←88]

Curtius (viii.9) says Indians drank much wine; Megasthenes insisted it was used only on sacrificial occasions. Brahmins of the Ganga punished intoxication severely, but the people of Punjab loved their drink and the Periplus lists wine as an Indian import.

[←89]

Indigo (Indikon Melan of the Periplus and Nili of Sanskrit).

[←90]

At the time of Alexander's invasion, Taxila was ruled by Omphis (Sansk. Ambhi), also called Taxiles, who surrendered meekly to the Greek warrior.

[←91]

Curtius (viii. 12) says Taxiles presented Alexander and all his friends with golden crowns, and eighty talents of coined silver. Alexander returned the presents and added a thousand talents with many banqueting vessels of gold and silver, Persian drapery, and thirty chargers from his own stalls, caparisoned as when he rode them himself. Maleager made the envious remark at supper, in Alexander's presence. The King, chastened by the murder of Kleitos, replied that envious persons only tormented themselves.

[←92]

Abisaros or Abisares ruled part or whole of Kashmir; he was as powerful as Taxiles and Porus. His name derives from that of his kingdom, Abhisara, now Hazara. After Alexander subdued Massaga, Abisares sent troops to help the Indus tribes; but could not arrive in time to help Porus, with whom he had an alliance. Porus' defeat caused him to surrender to Alexander.

[←93]

The Western Himalayas. Lassen derives the word from the Sanskrit haimavata, meaning ‘snowy’.

[←94]

A large and powerful breed of dogs is still found in the part of Punjab where the dominions of Sopeithes were situated. Aristotle, Diodoros, Pliny, and Aelian concur that tiger blood ran in the veins of these dogs. This story is also found in Curtius ix. I; Diodoros xvii. 92; and Aelian viii. I.

[←95]

Pataliputra, modern Patna, ancient capital of Magadha. The wooden wall mentioned was seen in the fifth century AD by the Chinese pilgrim Fa-Hian. Two centuries later, Yuan Chwang found nothing but ruins and an insignificant village of 200 to 300 houses. The inhabitants are Prasioi, Sanskrit Prachya (Eastern), probably given to them by the people of Punjab.

[←96]

The Indian King called Sandrokottos by the Greeks is generally identified with Chandragupta, founder of the Mauryan dynasty of Magadha, to which Asoka belonged.

[←97]

The account of Indian castes which Strabo extracted from Megasthenes is also found in Diodoros (ii. 40-42), and Arrian's Indika (cc. 11 and 12). Hindus have four varnas; possibly Megasthenes reported seven distinct occupations as castes.

[←98]

Strabo diverges into a discussion on gold-digging ants, claiming to have seen their skins which resembled the hides of leopards. He cites Megasthenes to locate them in Dardistan or north-west Kashmir, on the banks of the Indus. The gold is collected by the Derdai, the Daradas of Sanskrit literature.

[←99]

Strabo was in Egypt with his friend Aelius Gallus in 24 BC, six years after the death of Cleopatra.

[←100]

The Indian gharial is a fish-eater.

[←101]

The drachma was a silver coin nearly equal in value to the Roman denarieus.

[←102]

Megasthenes must have known that Indians knew the art of writing. He probably meant they did not have written laws.

[←103]

Curtius says this happens within the palace (viii.9): ‘ The palace is open to all comers, even when the king is having his hair combed and dressed. It is then that he gives audience to ambassadors and administers justice to his subjects. His slippers are after this taken off and his feet are rubbed with scented ointments’.

[←104]

Alexander's men identified Indian gods with Greek gods with similar attributes or similar rites of worship.

[←105]

Garmanes is an error; it should be Sarmanes, Sanskrit Sramana, ascetic. Megasthenes failed to grasp the philosophy of the Brahmins, but made some acute observations, noting that they recognize five principle things of which all things consist, for they add a fifth substance called akasa, i.e ether.

[←106]

The time period of studentship is exaggerated.

[←107]

This passage about ascetics is found also in Clemens Alexandrinus (Strom. i.) He calls them correctly Sarmanai, but errs in calling the ascetics of the woods Allobioi instead of Hylobioi, Sanskrit Vanaprastha.

[←108]

It was actually the younger man who went with Alexander; the Greeks called him Kalanos. His real name, says Plutarch, was Sphines. The elder was Dandamis, or Mandanes. These and other Indian philosophers were caught by Alexander while walking in the open meadow. At the sight of the king and his army they stamped their feet on the ground. Asked by interpreters what this meant, they replied: ' O King Alexander! Every man possesses as much of the earth as this upon which we have stepped, but you, though but a man like ourselves, only more arrogant and meddlesome, have traversed so much of the world troubling both yourself and others; and yet you must soon die and possess no more than the spot of earth which will suffice to bury you.'

[←109]

Onesikritos followed the Cynic School of Philosophy founded by Diogenes.

[←110]

Possibly a reference to the practice of Svayamvara, choice of husband by a princess or daughter of a Kshatriya at a public assembly of appropriate suitors.

[←111]

McCrindle says Kalanos burnt himself at Susa, not Pasargadai.

[←112]

Pramnai should be Sramanai, ascetics.

[←113]

The Classical Accounts of India, R.C. Majumdar, Firma K.L. Mukhopadhyaya, Calcutta, 1960 and Ancient India as described in Classical Literature, John W. McCrindle, First Indian ed. 1979 (rpt. 1901- Westminster), Oriental Books Reprint Corporation, New Delhi.

[←114]

The length of India from 350 N. Lat. to Cape Comorin 805' is about 1900 miles; its breadth, reckoned along the parallel of 250 N. Lat. eastward to the river Brahmaputra, is about 1400 miles.

[←115]

Greeks after Alexander remained for centuries in thrall of Indian philosophers and the severe austerities they practiced.

[←116]

A jugerum is 240 feet long by 120 broad; the pristis may be saw-fish.

[←117]

These eels are probably water-snakes, whose length has been grossly exaggerated.

[←118]

It appears that a school of whales, not tunnies, alarmed the fleet.

[←119]

Possibly dolphin of the Ganga, which has the muzzle and tail of the common dolphin, but its length has been exaggerated. The jaws have conical recurved teeth.

[←120]

Sola India nigrun Fert ebenum.- Georg. ii. 116, 117.

[←121]

Some think this is the banana tree, others the pomegranate; some say pala is the paquovera of India, the fruit of which is called pacona.

[←122]

This may be the tamarind tree – Tamarindus Indica – the pulp of which is slightly laxative.

[←123]

Pepper grew along the Malabar coast; Periplus of the Erythroean Sea lists Tyndis, Muziris, Nelkynda, and Bacare as ports from which pepper was exported.

[←124]

Possibly the clove-tree; possibly the Myrtus Caryophyllata of Ceylon whose fruit matches Pliny's description.

[←125]

The Periplus says lycion was exported from the port of Barbarikon on the Indus and Barygaza (Bharoch) on the Nerbudda. It is a thorny plant whose juice was used for dyeing yellow; a liquor prepared from it was used as a medicine.

[←126]

The first Western writer to mention sugarcane is Theophrastus, disciple of Aristotle. He called it a sort of honey extracted from reeds. Strabo, citing Nearchus, says Indian reeds yield honey without bees. Aelian mentions a kind of honey extracted from reeds which grew among the Prasii (people of upper Bengal).

[←127]

Costus (Sans. Kushtha) was prized as the best aromatic root; it was exported from Barbarikon and Barygaza.

[←128]

Nard-oil was extracted from a plant called jatamansi in Sanskrit, a species of valerian found in the mountainous parts of India, Nepal, Bhutan.

[←129]

There is no consensus among scholars about the identity of this plant.

[←130]

The cardamum is found in India, but not in Arabia.

[←131]

‘Blood-staunching.’

[←132]

The identity of this kind of calamus is uncertain. It may be a gramineous plant of the genus Andropogon, or the Indian Gentiana chirayta, called lemon-grass from its scent.

[←133]

This may refer to mangrove swamps, but the reference to the height of the trees is absurd.

[←134]

The oil is used for food, medicinal purposes, and as a cosmetic.

[←135]

The Salt Range between the Indus and Hydaspes (Jhelum).

[←136]

The preparation of the drug from the indigo plant has great antiquity in India.

[←137]

The electron or amber of trees was shellac; lac insects found with it yielded a red dye.

[←138]

Adamas was used for several minerals, such as quartz, specular iron ore, emery, and other hard substances, besides diamond. However, the reference to its hexangular and hexahedral forms suggests some other mineral.

[←139]

Actually opal is found in many parts of the world.

[←140]

The word sardonyx is compounded of the Greek words ‘ sard’ and ‘ finger-nail’.

[←141]

Onyx is an agate formed of alternating white and black or dark brown stripes of chalcedony.

[←142]

Possibly the cherry-coloured ruby, but could also be tourmaline, a silicate of alumina.

[←143]

Sarda is carnelian of a very deep red colour; it was first found at Sardis and thence its name.

[←144]

Star-stone, some kind of star-sapphire.

[←145]

Possiby refers to tree and moss agates.

[←146]

This stone gets its name from ‘ a tortoise;’ Pliny says it was used by magicians for divination.

[←147]

The Classical Accounts of India, R.C. Majumdar, Firma K.L. Mukhopadhyaya, Calcutta, 1960.

[←148]

They fought Alexander when he passed the Kunar river valley. Also Aspasiosi, Greek Hippasiosi; known for their horses, the name probably derives from Persian Aspa, Sanskrit Asva; identified with Asvakenos, Asvayanas of Panini; Encyclopaedia of the Hindu World; G.R. Garg, p. 711.

[←149]
Swat Valley

[←150]

Alexander continued his conquest, defeating the Glausians; the Assacenians and the puissant Cathaeans, Oxydracians and Mallians. After these bloody victories, his men refused to advance further.

[←151]

The Jhelum, Chenab, Ravi and the Beas rivers.

[←152]

Coenus' speech makes it clear that the Greek casualties in the Indian wars were far higher than stated by Greek historians after every battle. Alexander sulked for three days, but failed to change the minds of the Macedonians and Grecian allies. Retreating, he battled the valiant tribes he encountered, notably the Mallians, and was severely wounded in the chest and nearly bled to death. His army faced immense difficulties and privations on the way back.

[←153]

The Classical Accounts of India, R.C. Majumdar, Firma K.L. Mukhopadhyaya, Calcutta, 1960.

[←154]

Arrian repeats the by now entrenched Greek belief in seven castes, along with the prohibition on changing professions and marrying outside the caste. The discussion on capturing and taming of wild elephants is greatly elaborated by him, and taken up after the enumeration of castes.

[←155]

The commerce and navigation of the Erythraean Sea and Ancient India as described by Ktesias the Knidian (rp. 1984 of Calcutta-London 1879, 1882 editions), Today & Tomorrow's Printers and Publishers, New Delhi.

[←156]

Used by women to dye their nails and feet; also as a dye.

[←157]

Sanskrit Guggula, used as a tonic, and for skin and urinary diseases.

[←158]

More likely from Nepal, where it is called tejapat.

[←159]

Obtained from the root of Nardostachys jatamansi, a native of the eastern Himalayas.

[←160]

Nero paid 300 talents for one; equivalent of 58,125 a century ago. They were first seen at Rome in the triumphal procession of Pompey.

[←161]

Possibly lapis lazuli.

[←162]

Ariake or Aparantika, the author says, was the frontier of India. The part bordering Skythia was called Aberia or Abiria, from Abhira. The sea-board of Ariake was called Surastrene, Sanskrit Surashtra. Its capital was Minnagar, a city of the Min (Skythians), different from Minnagar which was the capital of Indo-Skythia. It lay south of Ozene (Ujjain) on the road to the Narmada, probably near Indore.

[←163]

The promontory Papike projects into the Gulf of Khambhat; its distance from Barbarikon on the Indus' middle mouth is correct. Astakapra has been identified with Hastakavapra (Hathab near Bhaunagar), a name found in a copper-plate grant of Dhruvasena I of Valabhi.

[←164]

The gulf beyond Papike is only the northern portion of the Gulf of Khambhat, which Periplus calls the Gulf of Barugaza. It receives the river Mais (Mahi). Barugaza (Bharoch) was the greatest seat of commerce in Western India.

[←165]

The aromatic spikenard was a product of three districts, hence known as the Kattybournine, the Patropapigic and the Kabolitic. The places indicated by the first two cannot be ascertained, but the last was undoubtedly the region round Kabul (Ptolemy called its inhabitants Kabolitai).

[←166]

Periplus places Paithana 20 days' journey to the south of Barugaza, and Tagara 10 days' eastward from Paithana. Tagara is not identified - some think it is Devagiri or Deogarh, near Ellora, about 8 miles from Aurangabad, but the distances do not match. It could be Junnar (i.e. juna-nagar=the old city.), which must always have been an emporium due to its location.

[←167]

Celobotras, Sanskrit Keralaputra; his capital was Karoura (Karur), an important town in Coimbatore district.

[←168]

Scholars have identified Muziris with the Muyiri of Muyiri-kotta; Tyndis with Tundi, and Kynda, of Nelkynda.

[←169]

Nelkunda probably lay between Kanetti and Kolum in Travancore.

[←170]

Sanskrit Pandu, father of the Pandava brothers. The capital of this prince was Modura, Sanskrit Mathura.

[←171]

Nelkunda was probably the limit of the author's voyage along the Indian coast, as the sequel of his narrative is vague about places and the details at times grossly inaccurate, eg: the Malabar Coast extends southwards beyond Cape Comorin and Ceylon stretches westward almost as far as Africa!

[←172]

Paralia is South Travancore and South Tinnevelly, it began at the Red Cliffs south of Quilon and included Cape Comorin.

[←173]

Kamara may be the emporium Ptolemy calls Khaberis at the mouth of the Kaveri; Sopatma is not identified.

[←174]

The last place mentioned in the Periplus is Thinai, an inland city of the Thinai or Sinai, with a large commerce in silk and woollen goods. It may be the city Marco Polo called Kenjan-fu (Singan-fu or Chauggan), the most celebrated city in Chinese history and capital of several important dynasties.

[←175]

Ray, Niharranjan et al, A Sourcebook of Indian Civilization, Orient Longman Ltd., 2000, p. 606-612.

[←176]

L. Casson, ‘New Light on Maritime Loans: P. Vindob G 40822’, Zeitschrift fur Papyrologie und Epigraphick, Band 84, 1990, pp. 195-206; quotation from p. 200-202.

[←177]

The Classical Accounts of India, R.C. Majumdar, Firma K.L. Mukhopadhyaya, Calcutta, 1960 and Ancient India as described in Classical Literature, John W. McCrindle, First Indian ed. 1979 (rpt. 1901- Westminster), Oriental Books Reprint Corporation, New Delhi.

[←178]

This palace is probably that of Sandrokottos at Palibothra (Patna) and the account maybe from Megasthenes.

[←179]

It is not clear what bird this is.

[←180]

This bird is not mentioned anywhere else; said to be like the attagen.

[←181]

People of northern Bengal and Bihar.

[←182]

‘ Sora,’ is the Sanskrit Chola and Tamil Sora or Chora. Soras would be the king.

[←183]

Eukratides, one of the most powerful of Graeco-Baktrian kings, reigned from 181 to 147 BC.

[←184]

Not identified.

[←185]

The panther, not the lion, was used for hunting.

[←186]

The Peripatetic school of philosophy associated with Aristotle and Theophrastus. The colonnade in which the philosophers discoursed is called peripatos in Greek.

[←187]

During Apollonius' visit, the king was Gondophares. Excavations at Taxila endorse Philostratus' account of the city: cf. Sir John Marshall, A Guide of Taxila, 4th edn., 1960, p. 28-30.

[←188]

This is the temple of Jandial; ibid., p 29, 88-9.

[←189]

This shrine has been identified in excavations at Taxila with the discovery of a stone image of the Sun-god, Marshall, op. cit., p. 30.

[←190]

Excavations have confirmed Philostratus' report of the modest proportions of the palace at Taxila, ibid., p. 30 and 69.

[←191]

Both the translator and editor consider ‘ and their fruit ’ to be an interpolation in the text.

[←192]

In antiquity, Red Sea was a generic term for the Indian Ocean and its offshoots, the Persian Gulf, Gulfs of Aqaba and Suez, and the Egyptian Red Sea.

[←193]

Erythros is Greek for ‘red’, hence Philostratus’ etymology.

[←194]

A rival philosopher and enemy of Apollonius.

[←195]

This was a mild rebuke that they went naked, not out of asceticism, but necessity or comfort.

[←196]

An ox on one's tongue was an allusion to keeping silent. Cf., for example, Aeschylus, Agamemnon, 36.

[←197]

Flavius Clemens, nephew of Vespasian, consul in AD 95, married Flavia Domitilla. They were probably executed soon after Clemens' consulate on charges of impiety; scholars believe they may have been Christians.

[←198]

The Classical Accounts of India, R.C. Majumdar, Firma K.L. Mukhopadhyaya, Calcutta, 1960 and Ancient India as described in Classical Literature, John W. McCrindle, First Indian ed. 1979 (rpt. 1901- Westminster), Oriental Books Reprint Corporation, New Delhi.

[←199]

The embassy probably came from the Maratha region, given the name of its chief, Sandanes, and the mention of the Rock-temple, which abound there, especially in the maritime district which Ptolemy called Ariake Sadinon, meaning Ariake ruled by the Sadaneis or Sandaneis. This district was commercially very active, and probably undertook the embassy to the Roman Emperor for this reason.

[←200]

Shiva as Ardhnarishwar; depicted in the rock temples and on Scythian coins.

[←201]

Lassen thinks the statue was made of teakwood.

[←202]

Lassen thinks this suggests an image of the river goddess Ganga.

[←203]

The cyst of the male, about the size of a hen's egg, contains a clotted, oily, friable matter of dark brown colour; this is the true musk.

[←204]

This chapter is based upon (i) Sastri, K.A. Nilakanta, A History of South India from Prehistoric Times to the Fall of Vijayanagar, Oxford University Press, 4th ed., Delhi, 2006; (ii) Travels of Fah-Hian and Sung-Yun, Buddhist Pilgrims from China to India (400 AD and 518 AD), translated from the Chinese, Samuel Beal, London 1869, rpt. Asian Educational Services, New Delhi 2003; (iii) The Soka Gakkai Dictionary of Buddhism, Soka Gakkai, Japan, 2002; (iv) Dictionary of Pali Proper Names, G.P. Latika Lahiri, Motilal Banarasidass, Delhi, 1986; (vi) Chinese Sources for Indian History, National Archives of India; and (vii) H.K. Kaul, ed., Travellers' India. An Anthology, Delhi, Oxford University Press, 1979.

[←205]

In our own era, Indian President Pratibha Patil revived the ancient civilisational ties between the two lands when on 29 May 2010, she inaugurated an Indian style Buddhist temple at the White Horse temple complex in Loyang, cradle of Buddhism in China. This is the first Indian-style Buddhist temple to be erected in China in 1,900 years, since the Indian monks Kashyapamatanga and Dharmaratna helped establish the first Buddhist shrine there. Built with red sandstone and Kota stone from India, the temple stands on 6,000 square metres of land allotted by the Chinese Government during the visit of the then Prime Minister Atal Bihari Vajpayee in 2003, Times of India, 30 May 2010.

[←206]

Chinese scholar Prof. Liang ch'i-ch'ao (1873-1929) listed as many as 180 monk-pilgrims in his essay "Chinese students going abroad 1500 years ago and afterwards" (See Chinese Sources for Indian History, National Archives of India, p. 83).

[←207]

Travels of Fah-Hian and Sung-Yun, Buddhist Pilgrims from China to India (400 AD and 518 AD), trans. from Chinese, Samuel Beal, London 1869, rpt. Asian Educational Services, New Delhi 2003. See also A Record of Buddhistic Kingdoms Being An Account By The Chinese Monk Fa-Hien Of Travels In India And Ceylon (AD 399–414) In Search Of The Buddhist Books Of Discipline, Trans. James Legge, Munshiram Manoharlal, Delhi, 1998; original Clarendon Press, Oxford.

[←208]

Former capital of the province of Shense.

[←209]

The Vinaya Pitaka, collection of sacred books relating to Discipline and Morality. The Sutra Pitaka contains the discourses of Buddha, and the Abhidharma Pitaka includes all compositions explaining doctrine.

[←210]

This should be the cyclical characters Kang tsze, i.e., 400-1 AD.

[←211]

Prince who ruled Yuen Chun in the western part of Shense.

[←212]

Prince who ruled Ho Si, to the west of the Yellow River.

[←213]

In the province of Kansu, just within the north-west extremity of the Great Wall.

[←214]

Tun-nieh of Liang Chow, who died in 401 AD.

[←215]

A frontier town of military significance, mentioned by Marco Polo as Sachion.

[←216]

The Chinese mile; five li equal one English mile.

[←217]

The Leou-lun of Yuan Chwang. Fah-Hian and Yuan Chwang departed from China through the Yuh Mun (Gem Gate) just beyond Su-Chow. Yuan Chwang proceeded northwards towards Kamil, while Fah-Hian advanced SW towards Lake Lob. Yuan Chwang returned to India by the outward route.

[←218]

Sanskrit Sramana; Pali Samana.

[←219]

Garden of the priests; includes the vihara, living quarters, and surrounding grounds.

[←220]

A being who has attained the Buddha knowledge, but remains in the world for the benefit of men.

[←221]

Asoka gave the whole of Jambudwipa to the monks and then redeemed it for a sum of money.

[←222]

Rémusat identifies this with Darada or Dardu, but Beal thinks it is a small town called Dhir, near River Tal.

[←223]

Rémusat thinks this refers to the office of interpreters in the foreign affairs department under the Han dynasty.

[←224]

A Chinese general in the reign of Wou-ti of the Han dynasty, 122 BC; he led the first memorable expedition into Central Asia.

[←225]

Sent to the Caspian Sea to subdue the Roman empire in the first century AD, he returned on being told it would take two years to cross the sea owing to an unfavourable wind.

[←226]

Eastern Han dynasty (25–190 AD).

[←227]

770 BC. It is a Chinese tendency to push back the date of the Buddha and Buddhism.

[←228]

Refers to the Buddha, the Dhamma, and the Sangha.

[←229]

Second emperor of the Eastern Han dynasty (discussed previously).

[←230]

A custom from the time of Alexander; Apollonius was permitted to reside in Taxila for three days.

[←231]

Nagarahara in the basin of the Kabul river; mentioned by Ptolemy; close to Jalalabad.

[←232]

Continent to the south of Mt. Sumeru, including India and China, according to Chinese accounts.

[←233]

The distance now comes to be measured in yojanas, which differ in different districts. In the north-west provinces a yojana = 7 miles, but in the Magadha region it is 4½ miles.

[←234]

The elevated skull-bone is an index of great religiosity of character. Called Sariras, these relics are supposed to be indestructible and are found among the ashes after the cremation of a great saint.

[←235]

These include gold, silver, lapis lazuli, crystal, cornelian, coral, ruby.

[←236]

Yuan Chwang also mentions this stupa, whose foundations alone remained; the relic had vanished.

[←237]

This absurd length is attributed to the fact that the Buddha is often given a stature of 12 or even 18 cubits.

[←238]

A meal prepared at an unusual hour; Buddhists do not eat after mid-day except when ill or travelling.

[←239]

Maha Kasyapa was the first Buddhist patriarch. One of three brothers who worshipped fire, he submitted to Buddha and converted his brothers, each bringing 250 disciples to the fold. These, with the 500 of Sariputra and Mogalan comprise the 1250 followers of Buddha frequently mentioned in the Sutras.

[←240]

A collection of Buddhist literature.

[←241]

A semi-historical character deified in Nepal and Tibet; the Chinese regard him as a great teacher.

[←242]

Near Farakhabad, the Kapitha of Yuan Chwang.

[←243]

Buddha's mother died seven days after his birth; later he ascended heaven to preach the Law for her sake.

[←244]

108 auspicious marks on each foot.

[←245]

Universal monarch in whom the chakra (discus) of Vishnu abides.

[←246]

The lowest heavens in the world of forms (Rupa loka).

[←247]

Cunningham visited the spot (1862) and found a pillar of the age of Asoka, with a well carved elephant on the top, minus trunk and tail. Possibly Fah-Hian mistook the animal for a lion.

[←248]

Error in text; it should be north and not south.

[←249]

Not to be confused with that of Yuan Chwang, which is in the Deccan (Dakshina Kosala).

[←250]

Buddha spent 25 years here after his enlightenment.

[←251]

Buddha's aunt (mother's sister); she nursed him after the death of his mother.

[←252]

Known as Anathapindika, he gifted the Jetavana Garden to Buddha.

[←253]

Yuan Chwang reported the pillars were 70 feet high, erected by Asoka, with a dome/cupola on one and elephant on the other. Cunningham thinks the elephant's trunk was broken; hence Fah-Hian mistook it for an ox.

[←254]

The son of Prasenajit; he exterminated the Sakya tribe of Buddha.

[←255]

Village Tadwa, nine miles west of Sahet-Mahet.

[←256]

Birthplace of the Buddha, on the river Rapti.

[←257]

Legend states Bodhisatwa descended from Tushita heaven in the form of a white elephant, surrounded by a halo of light and entered his mother's left side. The text says he descended seated on a white elephant.

[←258]

On a trip outside the palace, Buddha witnessed in succession an old man, a sick man, a dead man and a Shaman, and realized the ephemeral nature of life; he turned towards the spiritual life.

[←259]

The prince, his cousin Nanda and uncle Devadutta were leaving a sporting event when Devadutta spotted a huge elephant in the gateway and killed it with his fist. Nanda dragged the carcass to the side of the road. The Prince raised the carcass with one hand and flung it outside the city walls; it created a huge dyke in the earth, called Hastigarta.

[←260]

In a competition with the Sakyas at the age of fifteen, the prince with one arrow perforated seven golden drums, and with another seven iron blocks. The arrows went SE and struck the earth; water fountains gushed out.

[←261]

Viroudhaka abducted 500 Sakya women for his harem, but when they refused to submit to such disgrace, mutilated them and left them to die. They took recourse to Buddha and attained the condition of Devas (Jul. ii.307).

[←262]

Ramagamo of the Mahawanso; the distance between Kapilavastu and Ramagrama matches that given by Yuan Chwang.

[←263]

Originally divided into eight parts and given to eight claimants.

[←264]

Spelt variously in the text as Lichhavas, Lichchavis, etc.

[←265]

During the fifth year of his teaching.

[←266]

Ajatasatru, son of Bimbisara, king of Magadha; he flourished around 560 BC.

[←267]

Probably Mahendra, listed in Singhalese records as the son of Asoka.

[←268]

The description matches Buddha Ghosa, who translated Singhalese Buddhist scriptures into Pali, and must have been living in Patna at the time of Fah-Hian's visit.

[←269]

Beal says this account suggests Buddhist worship had already begun to change from original simplicity.

[←270]

Indrasilaguha, cave of the stone of Indra, identified with a peak called Giryek.

[←271]

Probably the Sangharama on the neighbouring peak, the Hansa (Wild Goose) Sangharama.

[←272]

As he had not yet attained the condition of a Rahat (attained full enlightenment).

[←273]

To break his fast, as six years of austerities had not given him complete wisdom.

[←274]

En route, the Brahman Santi gave him eight bundles of Kusa grass as he knew they would be required.

[←275]

The fourth dream of Buddha on the night prior to complete wisdom was that Lohini birds of different colours flew towards him from all quarters, but as they approached, they all became a golden hue.

[←276]

Names Tanha, Rati, Ranga.

[←277]

Bodhi-mandala, reputed to be in the exact centre of Jambudwipa.

[←278]

An obvious invention to give divine sanction to Asoka's later ascent; he was born long after Buddha.

[←279]

Buddhists believe in hells where sinners are punished for some time; these are normally situated between high mountains in particular parts of the earth.

[←280]

Yuan Chwang's account is very different (Jul. ii.415).

[←281]

Probably in the kingdom of Yuddhapati, mentioned by Yuan Chwang (Jul. i.134), near Ghazipura.

[←282]

Buddha first wanted to teach the Law to the ascetics Alara and Uddaka, but they were already dead. So he decided to seek the five ascetics who had practiced austerities with him for six years near Gaya, and now dwelt in the Deer Park. They were Adjnata Kaundinya, Asvajit, Vashpa, Mahanama, and Bhadrika.

[←283]

Beal says this is significant as it shows that even at this time the different Buddhist centres were preserving the doctrine mainly by tradition. This could account for the various schools which came up later.

[←284]

Later date sutras with repetitions of the same ideas.

[←285]

A work reputedly delivered by Buddha prior to his Nirvana.

[←286]

Near the mouth of the Hooghly; port of intense traffic with Ceylon and the southern coasts of India.

[←287]

Possibly refers to the Maldives.

[←288]

Possibly the carbuncle; greatly valued by Buddhists, as seen in the Tibetan prayer "Om mani padme hum."

[←289]

Devanampiyatissa sent the embassy shortly after the arrival of Mahindo; he also invited Sanghamitta to come to Lanka.

[←290]

On account of a patron he found on board.

[←291]

The Mission of Hwui Seng and Sung Yun to obtain Buddhist Books in the West (518 AD) [Trans. from the 5th Section of the History of the Temples of Lo-Yang (Honan Fu); in Travels of Fah-Hian and Sung-Yun Buddhist pilgrims from China to India (400 AD and 518 AD), trans. from Chinese, Samuel Beal, London, 1869; rpt. Asian Educational Services, New Delhi, 2003. All spellings are as in the text.

[←292]

Probably the Pi-Mo of Yuan Chwang (Julien iii.243). He also alludes to the figure in the Text, identified with the sandalwood image of Oudyana, king of Kausambi.

[←293]

This implies the use of magical influence to compel Buddha to send Rahula.

[←294]

Possibly Hi-mo-ta-la country of Yuan Chwang, bordering the Hindukush range.

[←295]

The La-la or Lara people were probably a Northern Scythian tribe, perhaps akin to the Paralatæ of Herodotus.

[←296]

It is a Chinese custom to receive royal messages with great ceremony.

[←297]

There is no other way of translating this passage, yet it is puzzling how they could carry such a head-dress.

[←298]

Possibly refers to some local legends.

[←299]

Sudatta, Bountiful Prince, gave the King of Kalinga a white elephant with the power to cause rainfall. This made the subjects force king Sanda to banish the prince with his wife, Madri Devi and his two children, to the rock Wankagiri, where the events alluded to in the text occurred.

[←300]

Possibly Madri Devi, but the passage is obscure.

[←301]

An ascetic called Achhuta in Singhalese accounts.

[←302]

Possibly Dragon Apalala, whose fountain to the N.E. of Moungali (capital of Udyana) gave rise to the river Subhavastu that flows through this territory.

[←303]

Then in the possession of the Great Yuchi, whose capital was Kabul.

[←304]

Possibly Onowei, known as "the Prince who seizes and holds firmly." He refused homage to the Wei Tartars, alluding probably to the circumstances recorded in this account of Sung-Yun.

[←305]

Possibly the Fa-hsienti (Betik) of Yuan Chwang, 400 li to the west of Bokhara.

[←306]

The Varousha (Po-lou-sha) of Yuan Chwang.

[←307]

Probably the Pilousara Stupa of Yuan Chwang.

[←308]

Tsioh-li means a sparrow; possibly a corruption of She-li (Sariras), relics in this celebrated pagoda.

[←309]

Yuan Chwang says it was a li and a half in circumference.

[←310]

Possibly a mistake in the text, as the height of the pillar should be 30 feet.

[←311]

Khakkaram Temple or Temple of the Religious Staff (vide Fah Hian, cap. xiii).

[←312]

Lokesh Chandra, Preface, The Life of Hsuan-tsang By his disciples Hui-li and Yen-ts'ung, complete Chinese text translated into English by Li Yung-his, Akshaya Prakashan, New Delhi, 2005 (original 1959).

[←313]

The subsequent selections are based upon Buddhist Records of the Western World, Trans. from Chinese of Hiuen Tsiang, AD 629, Samuel Beal, Munshiram Manoharlal Publishers Pvt. Ltd., 2004 (original 1884). Supplementary selections from The Life of Hsuan-tsang By his disciples Hui-li and Yen-ts'ung are given separately thereafter as they make interesting reading and deepen the narrative.

[←314]

Copper-water may refer to the size of the small hole made in the tamri (copper) cup for admission of water.

[←315]

The five degrees of religious advance among Buddhists: (I) The Vehicle of Buddha, (2) of the Bodhisattvas, (3) of the Pratyeka Buddha, (4) of the ordained disciple, (5) of the lay disciple.

[←316]

The order in which the four Vedas are mentioned here: Ayur Veda, Yajur Veda, Sama Veda, Atharva Veda.

[←317]

These are explained at length, but need not detain us.

[←318]

There seems to be a corruption in the text.

[←319]

This legend gave the place the name Taksha-siri, "the severed head," as noticed by Fa-hian and Sung-yun. The man for whose sake he gave his head was the wicked Brahman Rudraksha.

[←320]

The white-robed Svetambara Jaina munis; Yuan Chwang says their original teacher achieved enlightenment and first preached at Simhapura and there was an inscription to that effect.

[←321]

A sectarian prejudice!

[←322]

The images are similar, except that the Digambara images are without clothing.

[←323]

Kasmir was a large kingdom in ancient times; originally Kasyapapura; Kasmir was used in the Mahabharata.

[←324]

Meaning, did not distinguish holy from ordinary men.

[←325]

Supernatural beings who guard treasures.

[←326]

The country from the Ravi to the Sutlej; Cunningham placed it 11 miles north of Amritsar.

[←327]

Cunningham says there can be no doubt about the introduction of the China peach as it is still so-called in NW India.

[←328]

Kanishka and his associates hailed from the Gushan tribe of the Yuei-chi, who originally came from the borders of China.

[←329]

Katyayana probably flourished around 20 BC. The Abhidharmajnana-prasthana Sastra was translated into Chinese by Sanghadeva and another in AD 383, and by Yuan Chwang in AD 657.

[←330]

Probably the name of a kingdom of which Sarhind was the chief town, referred to in the text.

[←331]

Beal feels these trees are amla trees and mango trees; in other places in the text, An-mo-lo is said to be amra (mango).

[←332]

400 li north-east from Sthanesvara; capital at or near Kalsi.

[←333]

A river cannot be three-quarter miles wide at its source.

[←334]

Madawar or Mundore, in Western Rohilkhand, near Bijnore; the people may be the Mathai of Megasthenes.

[←335]

Mayapura or Haridwara; now on the western bank of the Ganga.

[←336]

Present Sankisa, 40 miles (200 li) south-east of Atranji.

[←337]

Possibly means the Rajput clan of Bais or Vaisa, not the mercantile caste.

[←338]

The town of Ranjamati, 12 miles north of Murshidabad in Bengal.

[←339]

This was Sasangka Narendragupta, king of Gauda or Bengal.

[←340]

Bana, author of Harshacharita, says his name was Bhandin. Siladitya patronised the best writers at his court.

[←341]

The promise of this oracle appears to be that if the advice is followed, then by mysterious energy the neighbouring kingdoms will have no one strong enough to resist the king. Siladitya indeed conquered the whole of north India and was checked in the south only by Pulikesi (Pulakesa), who received the title of Paramesvara for his victory.

[←342]

Possibly the mats or seats for discussion or religious services.

[←343]

Temporary, portable rest-house.

[←344]

Siladitya patronised all religious groups.

[←345]

Yuan Chwang was invited by the ruler of Kamrup, the western portion of Assam.

[←346]

Kajinghara, a small kingdom on the banks of the Ganga, 92 miles from Champa.

[←347]

A reference to the first emperor (Hwang-ti) of the Ts'in dynasty (221 BC), who broke up the feudal dependencies and centralized the government; he built the Great Wall to keep out invaders.

[←348]

Probably refers to the troubles which prevailed at the end of the Chow dynasty, which preceded the Ts'in.

[←349]

The Chinese believe the first Buddhist monks arrived there in the reign of the Ts'in emperor.

[←350]

The Akashya Vata, "undecaying banyan tree," which Cunningham found still worshiped at Allahabad.

[←351]

Kosambi-nagar, an old village on the Yamuna, 30 miles from Allahabad (Cunningham); mentioned in the Ramayana.

[←352]

Sravasti, in north Kosala, has been identified by Cunningham with a great ruined city on the south bank of the Rapti, called Sahet Mahet, 58 miles north of Ayodhya. Yuan Chwang apparently took a longer route.

[←353]

Buddha was born here.

[←354]

Kusinagara, where Buddha died, has been identified by Wilson and Cunningham with the present village of Kasia, 35 miles east of Gorakhpur.

[←355]

Most records speak of two sala trees (Shorea robusta), as does Yuan Chwang himself in the following extract.

[←356]

Exaggeration, based on information of local people; scholars think it could not be so large.

[←357]

Horse-faced musicians of Kuvera; the Chinese depict them as "something different from men."

[←358]

Mentioned also by Fa-hien.

[←359]

Fa-Hian's version (chap.xxxii) is different; the story seems to have been embellished with time.

[←360]

This prediction actually refers to Kalasoka, grandson of Ajatasatru, who made his capital at Pataliputra.

[←361]

Twenty-one miles west of Nalanda.

[←362]

His descendant Nagadasaka, who preceded the nine Nandas, seems to be the same as Maha-Nandin.

[←363]

Female deity of Tibetan origin; worshipped by the Yogachara school.

[←364]

Buddha was in doubt if there were men fit to hear the doctrine.

[←365]

This mountain corresponds to the lofty hill of Handia, 1463 feet in height (Cunningham).

[←366]

Fa-hien also said the five hills surrounding the town were like the walls of a city (ch. xxviii.)

[←367]

No caves have been discovered on this hill; but many later sutras relate to this hill.

[←368]

The famous Sattapanni cave housed the seven month long First Buddhist Council, Dipavamsa (Oldenberg, v. 5).

[←369]

The hall was constructed; the cave at the back was natural. See Fergusson, Cave Temples of India, p. 49.

[←370]

Others date the Sthavira school from the second convocation at Vaisali.

[←371]

Perhaps the Sannipata-nikaya.

[←372]

This account differs from common tradition, which dates this great assembly from the schism at Vaisali. Yet Yuan Chwang's statement that additional pitakas were collected at this assembly is useful and suggestive.

[←373]

That is, the walls of the citadel.

[←374]

Identified with village Baragaon, 7 miles north of Rajgir.

[←375]

The normal order of the sangha is that Bhikshus are classed according to the number of years in the sangha. But in Baladitya's vihara, they were classed according to their natural age. The king, though a disciple, was not fully ordained.

[←376]

Could also mean the stone foundation.

[←377]

The water of immortality.

[←378]

Communicate to the other.

[←379]

This Brahmin is well known from a work called Dirghanakha parivrajaka pariprichcha.

[←380]

Capital of Anga; country around Bhagalpur.

[←381]

An islet or detached rock; Cunningham identifies it with the rocky island opposite Patharghata with its temple-crowned summit (Anc. Geog. of India, p. 477).

[←382]

The Mahabharata mentions a kingdom of Kalingha in eastern India.

[←383]

Includes the districts of Rajashahi, Dinajpur, Nadiya, Birbhum, Bardwan, Midnapur, Jangal Mahals, Ramgadh, Pachit, Palaman and part of Chunar.

[←384]

Jack or bread fruit.

[←385]

A root that grows under old fir trees in China.

[←386]

Pragjyotisha; the kingdom included Manipur, Jaintia, Kachhar, West Assam, and parts of Mymensingh and Sylhet.

[←387]

Coconut.

[←388]

Modern Tamluk above the Selai, just above its junction with the Hooghly.

[←389]

The coast is a large bay.

[←390]

Devadatta appears to have had his own followers. Due to his inferiority vis-à-vis the Buddha, he became his enemy. One rule of his sect was not to use butter. A sect revering him as a Buddha existed up to AD 400.

[←391]

Identified as Jajipura on the Baitani; Fergusson suggests Midnapur.

[←392]

Remains, possibly of a stupa, have been found near Aska.

[←393]

Means divine beings. Cunningham thinks these hills are Udayagiri and Khandagiri, wherein many Buddhist caves and inscriptions have been found; they are 5 miles west of the grand temples at Bhuvaneswara.

[←394]

Cunningham thinks this is Ganjam.

[←395]

Different from Sravasti or Ayodhya, which was also called Kosala.

[←396]

Some say he lived 600 years; others say the 400-600 years accorded him refers to the development of the Mahayana.

[←397]

These forms of life are creatures oviparous, viviparous, born from spawn, or by transformation.

[←398]

The six ways of birth are as Devas, as men, as asuras, as pretas; as beasts; and in hell.

[←399]

There are many caves in a hill south of Bejwada.

[←400]

The passage is obscure. It seems Bhavaviveka challenges Dharamapala on the ground that his aim has not yet been accomplished and worshipping the Bodhi tree is foolish and inoperative. "Vow to accomplish your purpose, and it shall be accomplished irrespective of worship or humility" was probably the slant of Nagarjuna's teaching; Bhavavikeka, though a follower of Kapila, was full of Nagarjuna's spirit.

[←401]

This is an important passage. It shows that Bhavaviveka, imbued "with the spirit of Nagarjuna" though a follower of Kapila, exhibited his faith by going to Avalokitesvara.

[←402]

Either the Malabar Ghats or the ghats south of Coimbatore.

[←403]

Two hundred years after the introduction of Buddhism to Sri Lanka would be about BC 75, when the three pitakas were reduced to writing there.

[←404]

The Mahavihara was south of Anuradhapura.

[←405]

Probably the vihara with the tooth-relic.

[←406]

Possibly an error in the text; could be 30 li.

[←407]

Not identified clearly.

[←408]

Probably the famous rock-temples at Ajanta, in the Indhyadri range of hills.

[←409]

The ascetic Sthavira Achala; mentioned in an inscription on Caitya cave no. xxvi.

[←410]

An exaggerated account of the Chaityas; Yuan Chwang doesn't seem to have visited them personally.

[←411]

Seems to refer to two elephants sculptured on the rock in front of Cave XV, now scarcely recognizable.

[←412]

Confirmed by a grant of Dharasena II of Valabhi; the Sanskrit name of the founder is given as Atharya.

[←413]

A famous disciple of Vasubandhu.

[←414]

The old Prakrit name of Girnar near Junagadh in Kathiawar.

[←415]

Barmer in Rajasthan; many Kathiawar clans hailed from here.

[←416]

Extracts from The Life of Hsuan-tsang by his disciples Hui-li and Yen-ts‘ung; written after the pilgrim’s return to China, it shows his religious studies, royal patronage, and success in gathering manuscripts.

[←417]

The pilgrim's wishing thinking; the Ganga remains a potent force in Hindu belief to this day.

[←418]

Supplements the narrative of his visit to Sravasti.

[←419]

Monks, nuns, laymen, and laywomen.

[←420]

Freedom of life; freedom of mind; freedom of having the conducive requirements; freedom of karma; freedom of rebirth; freedom of understanding; freedom of will; freedom of supernatural powers; freedom of Dharma; and freedom of wisdom.

[←421]

The glory of wisdom and of blessed virtues.

[←422]

Identified with the ruins of Atranjikhera, four miles south of Karsana.

[←423]

Ketas on the north side of the Salt Range, 16 miles from Pind Dadan Khan.

[←424]

A Record of the Buddhist Religion as Practised in India and the Malay Archipelago AD 671-695; I-Tsing, translated by J. Takakusu, Munshiram Manoharlal, 1998; originally pub. Clarendon Press, London, 1896.

[←425]

Nanjio's Catalogue of the Chinese Buddhist Books, No. 1492.

[←426]

These included Nagarjuna's Suhrillekha, Matriketa's hymn in 150 verses, the Anitya-sutra.

[←427]

There are four sub-divisions, though I-Tsing mentions only three. One school is called the Mulasarvastivada, and as it is the same name as that of the original school, I–Tsing does not list is separately.

[←428]

According to the Samyuktavastu, Book vi (Nanjio's Catal., No. 1121), two Bhikshus from the south set out for Sravasti to see the Buddha. As the water around them was full of insects, the elder did not drink and died, and was born in heaven. The younger drank and was censured by Buddha. A similar story is told in the Jataka Commentary (Rhys Davids' Buddhists Birth Stories, vol. I, p. 278; and in Kullavagga V, 13, 2).

[←429]

Supposed to have happened in the sixteenth year of Buddha's ministry; see Rhys Davids, Buddhism, p. 73.

[←430]

Katurmaharagadevas, Mahavagga I, 6, 30.

[←431]

The Samyuktavastu, chap. xxxi; Samyuktaratna-sutra VII, 106.

[←432]

The five assemblies (parishads) are Bhikshus, Bhikshunis, Sikshamanas, Sramaneras, and Sramaneris.

[←433]

Mukilinda, in Mahavagga I, 3 comes to protect Buddha and hear his sermon; see SBE vol xiii, p. 80.

[←434]

Yojanas, spelt as yoganas throughout original text.

[←435]

A Chinese priest I-tsing met unexpectedly in India; his Sanskrit name was Pragnadeva.

[←436]

Three kinds of pure meat: (i) when it is not seen that it is being killed for oneself; (2) when it is not heard that it has been killed for oneself; (3) when it is not suspected that it may have been killed for oneself. See Mahavagga VI, 31,14, 2, SBE, vol. xvii, p. 117.

[←437]

The eight Chaityas are: Lumbini Garden at Kapilavastu; the Bodhi tree at Magadha; in Varanasi; Geta Garden at Sravasti; Kanauj; Rajagriha; Vaisali and Kusinagara.

[←438]

Gandhamadana, ‘Fragrant Mountain,’ lies in the region of the Anavatapta lake from which the four rivers, Sita, Ganga, Sindhu and Oxus originate. This is perhaps Manasarowar lake (lat.310N., long. 8103).

[←439]

Indians had an impression that Manjusri dwelt in China in I-tsing's time.

[←440]

Buddhaghosa in Mahavagga VI, 14, 7: Mutta-haritakan ti gomutta paribhavitam haritakam.

[←441]

The identity of this king is uncertain.

[←442]

A song about Buddha's last but one birth.

[←443]

The first Indian Buddhists who visited China in AD 67 and translated several sutras.

[←444]

Paramartha visited China in AD 548 and translated 31 works.

[←445]

Kumaragiva (Kumarajiva) visited China in AD 401 and translated 50 Sanskrit books into Chinese.

[←446]

The seven constituents of Bodhi are: recollection; investigation; energy; joy; calmness; contemplation; and equanimity.

[←447]

Two priests came to China AD 67; translations of Buddhist texts came loaded on a white horse, the White Horse Monastery was built at Loyang. Kasyapamatanga did one translation and Dharmaraksha five; Nanjio's Catal., App. ii, 1-2.

[←448]

K'ang-seng hui was an Indian of Tibetan origin who visited China in AD 241; Fa-hien visited India in AD 399–414 and is probably the 'dark elephant.'

[←449]

Tao-an died AD 389; Hui-yen submitted to the Eastern Tsin AD 317–419 and founded the White Lotus Society; he sent his disciples to Udyana to procure Sanskrit texts AD 408.

[←450]

Hui-hsiu and Fa-li lived under the Sui dynasty (AD 589–618); the former was a teacher of the Mahayana Samparigraha School.

[←451]

The Hye Ch'O Diary: Memoir of the Pilgrimage to the Five Regions of India (Religions of Asia Series, No 2) by Hyecho, Jan Yun-Hua, Iida Shotaro, Yang Han-Sung, Laurence Preston (Ed.), Asian Humanities Press, PO Box 3056, Berkeley, California 94703 and Po Chin Chai Ltd. 8 – 5 Ga Dangsan-Dry Yeongdueng po-ku, Seoul, Korea, Year not stated.

[←452]

The Buddha, the Dhamma, and the Sangha.

[←453]

Absence of slavery in India impressed the Greeks who came with Alexander the Great as well.

[←454]

Statues of the first five converts; now in the Calcutta Museum.

[←455]

Excavations show the column measured over 27½' in height and tapered from 2'4" diameter at the bottom to 1'10" diameter at the top; column was a short distance west of the main shrine.

[←456]

Identical with Yuan Chwang's record.

[←457]

Cunningham noted that all excavations near Sarnath have "revealed traces of fire, I myself found charred timber and half-burned grain. The same things were also found by Major Kittoe... [who] summed up his conclusions to me in a few words: 'All has been sacked and burnt, priests, temples, idols, all together. In some places, bones, iron, timber, idols, etc. are all fused into huge heaps; and this has happened more than once.'" Cunningham reports that some scholars believe "the place might have been burnt down by the Huns when they invaded northern India during the 5th and 6th century... [while others believe that] the Buddhist monuments might have suffered from the fury of the Moslem conquerors."

[←458]

This king should be Yasovarman, who sent his minister, Bhandanta Po-ta-hsin to the Chinese emperor Hsuan-tsang of the T-ang dynasty for diplomatic ties.

[←459]

Presumably Vatapi or Badami, capital of the Western Chalukyas, as this was the most important dynasty of the region at the time of Hye Ch'O's visit; though scholars argue that the Eastern Chalukyas of Vengi could equally be indicated. A solution is not possible due to the brevity of the account.

[←460]

Fa-hien and Yuan Chwang mention a cave temple called Bhramara in the mountain of Undavilli near Bezwada.

[←461]

Nagarjuna actually requested a Satavahana king.

[←462]

Oriens Extremus, p. 176: "The King of Kashmir, in 713 AD, when the Korean general Ko Hsien Chih was alive, applied to the Chinese Emperor for aid against the Arabs."

[←463]

Gandhara was Buddhist under Kanishka; famous for its sculptures.

[←464]

Vasubandhu was born in Peshawar in 400 AD; Asanga was his younger brother.

[←465]

A popular story in the Jataka tales in which Gautama, king of Sibi, was tested by Sakra (as a pigeon) and Brahma (as an eagle). The king offered his own flesh to the eagle to save the life of the pigeon.

[←466]

Damascus was the capital of the Arab empire which extended from Spain and Morocco to Turkestan and Sind by 715 AD, and dominated the Mediterranean.

[←467]

The Eastern Roman Empire. Hye Ch'O says the clothing of Eastern Romans, Arabs and Persians was similar.

[←468]

Possibly a reference to the Parsi faith.

[←469]

According to National Geographic Magazine, December 1959, Atlas Plate 44, Ferghana lies between Tadzhik SSR and Kirgiz SSR.

[←470]

Shignan, Shughnan in Badakhshanskaya, Tajikistan (former USSR), is north-west of Gilgit, Kashmir, in Yuan Chwang.

[←471]

Since Yuan Chwang did not go to Shignan, Hye Ch'O's descriptions here are very valuable.

[←472]

According to Fujita, King P'ei-hsing's ancestral home was Kashgar.

[←473]

In Kucha, the Tokharistan language was used by the people of Tarim basin at Kucha and Karashr, which are part of Sin-kiang in China; this language is classified as Indo-European.

[←474]

The general protectorate of An-hsi maintained control of all nations of the Tarim basin and monitored nations to the west of Tashkurgen, and controlled the traffic and trade.

[←475]

Khotan along with Kucha and Kashgar directly belonged to the general protectorate of Anhsi; Chinese officials ran the civil administration. The Khotanese language is classified as Indo-European.

[←476]

The Ancient Khmer Empire, Lawrence Palmer Briggs, Transactions of the American Philosophical Society, New Series, Vol. 41, Part I, 1951, p 17. I am grateful to Prof. Lokesh Chandra for this information.

[←477]

Briggs' comments are inserted in brackets. Material in parentheses is either a literal translation of the original source or indicates what was implied by the original author.

[←478]

Monuments of Civilization. Ancient Cambodia. Donatello Mazzeo and Chiara Silvi Antonini. Foreword by Han Suyin, Cassell, London, 1978. I am grateful to Prof. Lokesh Chandra for this information.

[←479]

Samguk Yusa. Legends and History of the Three Kingdoms of Ancient Korea, Il Yon; Trans. Tae-Hung Ha, Grafton K. Mintz, Yonsei University Press, Seoul, Korea, 1972. I am indebted to Prof. Lokesh Chandra for this information.

[←480]

Hsia is the name of the earliest Chinese dynasty of which there is actual evidence.

[←481]

Previously described as a trouser.

[←482]

There is obviously some confusion in these dates.

[←483]

Based on the Lives of Eminent Korean Monks, Trans. with introduction by Peter H. Lee, Harvard-Yenching Institute Studies XXV, Harvard University Press, Cambridge, Massachusetts, 1969. It gives the reader an idea of the religious traffic to India.

[←484]

Yuan Chwang was in India between 629-645 AD.

[←485]

Based on Chinese Monks in India. Biography of Eminent Monks Who Went to the Western World in Search of the Law During the Great T'ang Dynasty, I-Ching, trans. Latika Lahiri, Motilal Banarasidass, Delhi, 1986

[←486]

Sumatra; I-ching came to India by sea and stayed here seven years from AD 688-695 en route to India, as also on his return voyage.

[←487]

In AD 685 the Dowager Empress Wu of the T'ang Dynasty usurped the throne for twenty years, and started this era and the Dynastic title of Chou from this date.

[←488]

T'ai-Tsung, the second Emperor of the T'ang Dynasty started this era in AD 627.

[←489]

In Bodhgaya, Bihar; the Sangharama was erected in the Gupta period.

[←490]

Vasubandhu's Abhidharmakosa, a general exposition of Abhidharma.

[←491]

Third section of the Tripitaka, Abhidharmapitaka.

Discourse on the Madhyamika Sastra.

[←493]

One of the works of Asanga of the fourth century AD; reputedly dictated to him by Maitreya Bodhisattva.

[←494]

Came to the court of Kanauj in AD 655; Harsha had already died, and he was not received with honour.

[←495]

Wife of the most powerful Tibetan ruler, Srongstan-Gampo, who compelled the Emperor of China to give him a lady from the Imperial Court in marriage. She was a devout Buddhist and brought her faith to Tibet.

[←496]

Built by Emperor Wu of the Liang Dynasty in the period of P'u-t'ung (AD 520-527).

[←497]

Dharani, a collection of protective magical mantras.

[←498]

Tree near the Dragon lake which grew out of the twig thrown by Buddha after cleaning his teeth.

[←499]

The third T'ang Emperor Kao-Tsung started this era in AD 650.

[←500]

A vihara established by a king in present Bangladesh is mentioned in the Gunaighar plate inscription of Gupta ruler Vinayagupta, dated AD 507, 18 miles north-west of Comilla.

[←501]

A district of Ch'ang-an in Shen-si province under the Han dynastry. Peking was called Ching-Chao under the Republic.

[←502]

Under the Western Hans, I-chou comprised parts of Szu-ch'uan and Yun-an.

[←503]

Modern Hanoi near Tonkin in North Vietnam was a Chinese province from 111 BC to AD 939.

[←504]

Started by the third Emperor Kao-Tsung of Ta'ng Dynasty in AD 664.

[←505]

Generic term for Hinayana texts.

[←506]

The Mahaparinirvana of the Hinayanist was first translated into Chinese by Po Fa-tsu in AD 290-360 and by Fa-hsien between AD 417-420 in Tao-Ch'ang monastery. The Chinese Tripitaka contains three Hinayana translations and seven of the Mahayana.

[←507]

Built in AD 648 at Ch'ang-an in the reign of the great T'ang Emperor T'ai-Tsung.

[←508]

Started by third Emperor Kao-Tsung of Ta'ng Dynasty in AD 656, six years after his ascension to the throne.

[←509]

Sangharama donated by Calukya dynasty for Buddhist monks, sixth century AD.

[←510]

Besides the Central Asian route, there were two more overland routes from China to India. One was through Yunan province, Upper Burma and Assam, but was not commonly used; the other was through Tibet and Nepal.

[←511]

First founded in China by Bodhidharma who probably arrived in China in the mid-sixth century AD.

[←512]

Jethian, six miles south-west of Rajagriha; Buddha visited the place and Asoka built a stupa there. B.C. Law says it is two miles from Tapavana in Gaya, Bihar.

[←513]

The eastern peak of Indra sala-guha mountain at Rajagriha, where a wild goose fell dead to satisfy the hunger of the Hinayanist monks in the monastery there.

[←514]

Mantras of mystic knowledge.

[←515]

Method of teaching of the T'ien-t'ai school in China, sixth century AD.

[←516]

Dr. N.R. Ray thinks this king is Rajaraja (bhata) of the Ashrafpur copper plate inscriptions.

[←517]

Envoy to Harsha, king of Kanauj, in AD 641.

[←518]

The place where Buddha descended from Trayastrimsa heaven accompanied by Indra and Brahma.

[←519]

Eminent monk of South India, AD 635.

[←520]

Started by third Emperor Kao-Tsung of T'ang Dynasty in AD 662.

[←521]

The Dowager Emperor Wu of the T'ang Dynasty usurped the throne for 20 years and changed the dynastic title to Chou in AD 690; to commemorate this event she began a new era in the same year.

[←522]

Celebrated monk of the T'ang period, AD 618-907.

[←523]

Constructed in the Chen-Kuan period, AD 627-650, of T'ang Emperor T'ai-Tsung in Ch'ang-an.

[←524]

Ruled sixteen years from AD 534 to 550. Their capital was at Yeh in Honan province.

[←525]

The Vaipulya Sutras or Sutras of' infinite meaning' are the Mahayana Sutras, supposed to be preached by the Buddha before he first moved the Wheel of Law. They are nine, and among the Mahayana Sutras have the greatest merit.

[←526]

Four requisites of the Bhiksu: civara, pindapata, senasana, and gilan-paccaya-bhesajja (Majjhima Nikaya I.33)

[←527]

Monastery of the Eastern grove built by the authorities at the request of a Buddhist monk Hui-yung at Lu mountain, called Purva Vihara.

[←528]

The four rituals taught by Confucius: Literature, Personal Conduct, Being one's true self, Honesty in social relationship.

[←529]

Started AD 685 by Empress Wu of the T'ang Dynasty.

PUBLISHER'S NOTE

In the year 2004, on returning from South East Asia, Nobel Prize recipient, Sir Vidia Naipaul requested us to arrange a meeting with a group of Delhi based thinkers to share the impressions of his visit. He was simply overwhelmed with what he saw in South East Asian countries like Indonesia, Thailand, Cambodia etc. We hurriedly, invited about twenty people to a get together with Sir Vidia. The meeting held on June 15, 2004 was attented by Sarva Shri Dinanath Mishra, Balbir Punj, Brij Kishore Sharma, Shankar Saran, Meenakshi Jain, Sandhya Jain, Ram Madhav, Devendra Swarup and some others. Sir Vidia described how he was astonished to see deep Indian cultural influence in the region not only in the past but even today. He felt sad that present day Indians appeared to have little recollection of the grandeur of their ancient civilization and its lasting contribution to the world civilization. He felt strongly that it would be a worth while endeavour to prepare a compendium of foreign perceptions of India down the ages.

During later discussions, it was decided that the project would cover the period from earliest times up to the mid-nineteenth century, the changed sensibility towards India thereafter consequent to the establishment of the British Colonial rule, being well known. The present volumes are the result of these deliberations.

We are thankful to Sandhya Jain and Meenakshi Jain for agreeing to take up the project despite their other professional commitments and completing it so meticulously. We are grateful to Prof. Devendra Swarup for having agreed to coordinate the project till its fruition. Sandhya Jain compiled and edited the material for the first volume, while Meenakshi Jain prepared the remaining three volumes. Both of them have recorded their experiences and impressions in detailed Introductions to their respective volumes separately.

We wish to place on record our heartfelt gratefulness to Sir Vidia for not only conceiving the project, but also for painstakingly going through volumes I and III and making many valuable suggestions which the editors have attempted to incorporate. We feel indebted to Prof. Lokesh Chandra and Dr. B.M. Pande for their valuable contribution in the preparation of the first volume. We are highly grateful to Prof. Devendra Swarup, without

whose continuous active guidance and involvement, this ambitious project would not have seen the light of the day.

We are conscious that many other compilations of foreign accounts on India are already available, but we do feel that this series of four volumes will add much to the present knowledge of our readers in this area and also pave the way for publication of many other volumes based on the first hand study of the original sources in foreign languages other than English as, it was painfully discovered during the preparation of these volumes that most of the material still lies untranslated into English, which is the only window available to most of the Indian Scholars. With this Note, we offer these volumes to our readers and cordially invite their comments and suggestions, which would help us to improve the quality of the later editions.

INTRODUCTION

The classical accounts of Greek and Roman writers, and subsequently, the works of Chinese pilgrims vividly portrayed the splendour of civilisation in ancient India. The last notable account of that era was by I-tsing, who visited the country towards the close of the seventh century.

The world scenario had by then altered significantly with the advent of Islam and the attendant era of Arab expansion. The Arabs conquered Baghdad in A.D. 634, Syria in A.D. 636, Persia between A.D. 636 and 650, Egypt in A.D. 642 and Carthage on the northern Africa coast in A.D. 698. In A.D. 711, they crossed the Gulf of Gibraltar and entered the Iberian Peninsula. The following year Sindh also came under their control. The string of conquests from Spain to India enabled the Arabs to link the two major economic units of the Mediterranean and the Indian Ocean and dominate all the important maritime and caravan routes.

As a consequence of Muslim dominance, direct links between Europe and the East ceased. Europe became pre-occupied with the threat of Islam and fought nine Crusades between A.D. 1096 and 1291, albeit without any notable success. During these centuries, Europe almost wholly lost sight of the East as 'a land of reality.' The Bible increasingly became the primary source of geographical knowledge. The term 'India' was used to denote the subcontinent, the East Indies, indeed everything in the distant East. Many legends grew in Europe about a Christian community and a Christian king in India, who would assist the Crusaders in the fight against Islam. Europe during those centuries had only a hazy and distorted picture of the India known to the Greeks and Romans.

The age of Arab travellers, geographers, merchants and historians commenced with the Islamic ascendancy. Many Arab merchants and travellers to India kept diaries of their journey, while others conveyed information to geographers who wrote valuable accounts of the country. Among the earliest diaries of that period was of the merchant Sulaiman, written around A.D. 851.

India was then at a high point in her intellectual and cultural attainments. Masudi recorded the contemporary belief that 'wisdom (*hikma*) originally came from al-Hind.' The Arabs transmitted knowledge of Indian numerals, mathematics, philosophy and logic, mysticism, ethics, statecraft, military

science, medicine, pharmacology, toxicology (works on snakes and poison), veterinary science, astronomy and astrology to the outside world. Games like chess and *chausar* were also taken from India. An Arab author from Andalusia referred to an Indian book on tunes and melodies. Indian fables and literary works found reflection in the *Thousand and One Nights*. The early Arab attempts to study Indian culture and social life were manifested in the works of Sulaiman, Ibn Khurdadbib, Masudi, among others. Even before his arrival in India, the celebrated Alberuni had some Indian works in his library, which were translated into Arabic under the Abbasid caliph, Al Mansur (754-775), and the Barmakid *vazirs* of Harun ar-Rashid. Among these were the *Brahmasiddhanta* and the *Panchatantra*. This tradition ended with Alberuni in the first quarter of the eleventh century.

Arab travellers described the grandeur and wealth of the kings of India, singling out for special mention the Palas, the Gurjara Pratiharas and the Rashtrakutas. The Arab appellation for the Pala kingdom was 'the kingdom of Dharma,' after Dharmapala (r. 769-815), the greatest ruler of the dynasty. According to Arab accounts, Dharmapala possessed the largest armed force in the country, and was accompanied by as many as fifty thousand elephants when he went on war. The number of washermen in his army was reported to be an astounding ten to fifteen thousand. Arab writers relate that in the Pala country was woven a cotton cloth so fine that it could pass through a ring.

The Gurjara Pratiharas, the Al-Jurz of Arab writers, were depicted as the 'enemies of Islam' par excellence. They were said to possess a cavalry unrivalled by any other king of India. The Rashtrakutas, who ruled in the Deccan from about A.D. 743 to 974, were presented by Arab geographers as the greatest kings of al-Hind and the fourth greatest monarchs of the world.

Arab accounts also detailed the infinite variety of Indian products that had entered long distance trade. The importance of the trade in pepper was additionally testified by the growth of expatriate communities of Muslims, Jews and Christians on the Indian coast. Besides pepper, other items in demand included various kinds of ointments, medicinal substances, poisons, antidotes, perfumes, incense, ginger, aloe-wood, spikenard, camphor, cloves, nutmeg, sandalwood, musk, cinnamon, camphor, and rhinoceros

horn. In Arabic, words of Indian origin were mostly for spices, medicines and perfumes.

In addition, precious stones and diamonds, elephant tusks, and textiles like silk, brocade, cotton and jute were valuable items of trade. India had early mastered the technique of fast dyeing from natural sources. Indian steel and metallurgical products like swords were also highly prized.

Politically, while north India was being subjected to Arab and Turkish invasions which culminated in the establishment of the Delhi Sultanate in A.D. 1206, the south moved on a different trajectory. In the last quarter of the tenth century, the Cholas on the Coromandel Coast (known as Mabar to the Arabs) replaced the Rashtrakutas as the paramount kings of India. The eminent rulers of that dynasty included Rajaraja (r. 985-1014) and his son Rajendra (r. 1014-1044). The Chola kingdom, based in the fertile Kaveri delta, also enjoyed proximity to the active sector of long-distance trade extending from southern India through Southeast Asia into South China. It was probably the desire to strengthen control over international trade that led Rajaraja to annex the northern part of Sri Lanka (Ceylon) between India and the regions to its east.

His successor, Rajendra, completed the conquest of Sri Lanka and thereafter dispatched a naval expedition against Srivijaya, a maritime trading kingdom in the island of Sumatra. The victory of the Chola fleet led to fifty years of Indian dominance over the Strait of Malacca, the vital sea passage between the Malayan peninsula and Indonesia, through which all trade to, and from, China was routed. By A.D. 1200, the Chola kingdom had withered away.

In A.D. 1336, was established the Vijayanagar kingdom, which stood as a bulwark against Muslim attacks from the north for over two centuries. It eventually became the largest empire ever created in South India. The capital city was a massive site; the defensive walls, intended to ward off invaders, overwhelmed viewers by their sheer scale. Recent research indicates that about 650 square kilometres were encircled by these walls. A cultural highlight was the nine-day Mahanavami festival associated with veneration of goddess Durga. In 1347, the Muslim Bahamani kingdom was also founded in the South.

Meanwhile, European leaders, still convinced they would receive assistance from the East in their struggle against Islam, began to view the

ascendant Mongols as possible allies. They persisted in this belief despite Mongol depredations in Poland and Hungry in A.D. 1240. The Mongols had then refrained from attacking the heart of Christendom, possibly because of the death of their leader, Genghis Khan.

In 1245, from the Council of Lyons, Pope Innocent IV dispatched two embassies to Mongolia. A Franciscan, John of Plano Carpini, accompanied by the Polish Friar Benedict as interpreter, was to go to the headquarters of the Grand Khan through Poland and Russia. John was the first European to travel east of Baghdad and return to tell his tale.

Shortly after John commenced his journey, the Council of Lyons declared that missions should be undertaken to Mongolia as part of Christendom's efforts to win a powerful Asiatic ally against Islam. The sack of Baghdad by the Mongols, in 1258, strengthened Christian hopes for an anti-Islam alliance. By the mid-thirteenth century, two routes to the Mongol Empire were opened, one in northern Europe through Poland, the other through Syria and the old trade routes of southwestern Asia.

The opening of the land routes between Europe and Mongolia was followed, in 1264, with the Mongol ruler, Kublai Khan, extending his sway over China south of the wall. That year he established his residence at Peking. Among his first visitors were the Venetian merchants, Nicolo and Maffeo Polo. Unable to satisfy Kublai Khan's curiosity about Europe, they returned as his emissaries with a request to the Pope to send a hundred learned men to Peking to instruct the Mongols about Europe. When the Polo brothers set out for Peking again in 1271, they were accompanied by Nicolo's young son, Marco.

Marco Polo passed through parts of India on his return journey home after seventeen years of stay in China. His visit marked the recommencement of direct contact between Europe and India after an interval of over a thousand years. Marco Polo found the commerce of India extending from the territories of Kublai Khan to the Persian Gulf and the Red Sea. He described the shore of India as abundant in nature's choicest products. The palm tree gave its milk in lieu of wine, the bread fruit tree afforded wholesome food, the betel nut and spices, everything to satisfy the palate was available in profusion.

Around this time, the Popes became interested in the prospects of conversion to Christianity of people in Central and Eastern Asia who had

not embraced Islam. They urged zealous monks as well as traders to make their way through Tartar and Turkish countries to the Far East. Several monks indeed undertook the journey to China, visiting India en route, or on their return journey. Among them may be mentioned John of Monte Corvino (Italy), who was commissioned to carry the Gospel to the Grand Khan in 1289, and spent thirteen months in India. He foresaw a rich harvest of souls in India.

The Franciscan friar, Odoric of Pordenone (probably German or Bohemian in origin), also selected for apostolic duty in China, passed through western India in A.D. 1321. He described the cultivation of pepper and ginger in Malabar. He lived in China for at least three years and left a complete account of his travels.

Giovanni Dei Marignolli was the last of the Franciscan Papal envoys sent to China in the period of Mongol dominion. He reached China in 1342, stayed for three or four years, and sailed for India in 1346 or 1347. In A.D. 1368, with the overthrow of the Mongols in China, the curtain between China and Europe came down once again.

In A.D. 1321, Jordanus or Jordan (a French Dominican monk of Severac in south-west France) sought to establish a Catholic mission on the Malabar Coast in India. His account of India was the best produced in the Late Middle Ages.

By the mid-fourteenth century, Italian merchants, especially the Genoese, were active in India and China. As early as 1224, a society for the promotion of trade with India had been established in Genoa. Information about Chinese silk and Indian spices was current in the mercantile world of Italy. The commercial revolution in the Mediterranean world from the twelfth to the fourteenth centuries was accompanied by a steady increase in population in Europe and a consequent growth of the European market. The Crusades had given the people of southern Europe a commercial frontier in the eastern Mediterranean region.

The growing demand in Europe was accompanied by an enhanced purchasing power. European merchants were quick to take advantage of the land routes opened by the Mongol conquests. In the attempt to gain direct access to emporiums in Asia, the Genoese led the way. The Venetians had also established friendly relations with the Mamluk Sultans of Egypt. Thus, occasionally, Christian Italians were able to travel in Arab ships from the

ports of Egypt and eastern Arabia to southern India. Among them was the Venetian merchant, Nicolo di Conti.

Besides the works of European travellers, several Chinese accounts of India are also available from the twelfth century.

This volume covers the period from the eighth to the fifteenth centuries. A general paucity of foreign works marks this epoch. In certain instances there are also problems in identifying the names and places mentioned in the accounts. The translation, too, appears faulty at times. Some statements are incredible and seem obvious exaggerations. Nonetheless, the accounts attest to Indian achievements in various fields like science, technology, architecture and crafts.

SELECT LIST OF TRAVELLERS AND WRITERS

(in chronological order)

Arab and Muslim writers

Sulaiman, the merchant, undertook several voyages to India and China during the first half of the ninth century. His travel diary, known as the *Akhbar us Sind wal Hind*, dated 851 AD, is the earliest by an Arab to have come down to us.

Jahiz (d. 864), a native of Basra, wrote a book exclusively on Indian religion which seems to have perished. Two of his *risalas* contain brief accounts on the religious practices and intellectual attainments of Indians.

Yaqubi (d. 900) was an officer in the Department of Correspondence under the Abbasids. He traveled widely and his universal history has a section on India.

Ibn al-Fakih (c. 902) was an Iranian geographer who wrote a five-volume work, the *Kitab ul Buldan,* an abridged version of which has survived. It contains valuable information on the social and economic life in the coastal regions of India.

Ibn Khurdadba (d. 911) attained high office under the Khalifas and employed his leisure times in geographical researches.

Abu Dulaf (d. 942), was an Arab poet and traveller, who visited Multan and the southern coast.

Buzurg bin Shahryar (10th century) as a ship captain used to sail from the ports of Iraq up to China. He recorded his experiences and those of other travellers in his work, *Ajaib ul Hind* (Marvels of India).

Abu Zaidul Hasan of Siraf (950) revised and supplemented the work of Sulaiman by reading and questioning travellers to those countries, among them Al Masudi.

Al Masudi visited nearly all the countries subject to Muslim rule and others besides. He said he travelled so far to the west (Morocco and Spain) that he

forgot the east and so far to the east (China) that he forgot the west. He was among the most admired writers in Arabic. He died in A.D. 956.

Al Istakhri was a native of Istakhr or Persepolis, and traveled through the Muhammadan countries from India to the Atlantic Ocean, from the Persian Gulf to the Caspian Sea. He seems to have written in the mid tenth century (951).

Ibn Haukal was a native of Baghdad. He left Baghdad in A.D. 943 and after travelling to various lands under Muslim rule returned to the city in A.D. 968. The following year he went to Africa. He completed his work around A.D. 976 (or 989?).

Al Biruni, a native of Birun, near Khwarizm, was born around A.D. 970-1. He was an astronomer, geometrician, historian, and logician. He entered the services of Sultan Mahmud Ghaznavi and accompanied him to India. He spent a long time in Hindustan, chiefly in the Punjab, and learnt the Sanskrit language. He acquired an intimate knowledge of Hindu philosophy, religion, customs and beliefs. He died in A.D. 1038-9.

Al Utbi was Secretary to Sultan Mahmud. His work covers the entire reign of Subuktigin and of Mahmud up to A.D. 1020.

Abul Fazl Al Baihaki covers the period till A.D. 1059. He gives a graphic account of roughly fifty years of history of the Ghaznavids, including personal interviews with Mahmud Ghaznavi.

Muhammad U'fi lived in the reign of Iltutmish and dedicated his work to his minister, Nizam ul Mulk Muhammad. He was born in Bukhara and appears to have been a traveller.

Al Idrisi was born in Morocco towards the end of the eleventh century. He travelled in Europe and eventually settled in Sicily at the court of Roger II, at whose instance he wrote his book on geography. In the preface of his work, he cited the various authors he had consulted. Additional information was obtained from travellers, whose statements he compared and tested.

Ibn Asir, author of the *Kamilu-T Tawarikh,* was born in 1160 near Mosul. The work is a valuable account of the Ghaznavids and Ghorians. It contains few references to the Jats and interesting details on the Arab occupation of Sindh.

Hasan Nizami was born in Naishapur. Troubles in his native country led him to seek residence elsewhere. After a stay at Ghazni, he arrived in Delhi. He began his work in A. D. 1205, just a few months before the death of Muhammad Ghori. The history traces developments from the year A.D.1191 till part of the reign of Iltutmish.

Alauddin Juwaini was a native of Juwain, in Khurasan. He accompanied his father in the train of the Mongol governor in Persia, Arghun, to pay respects to the new emperor Mangu Khan. He was appointed governor of Baghdad by Hulaku Khan. His history stops at A.D. 1257. Its objective was to perpetuate the memory of Mangu Khan.

Minhaj us Siraj's family originally hailed from Juzjan, the country between Merv and Balkh. Minhaj came from Ghor to Sindh, Uch and Multan in 1227 and to Delhi in 1228. He was appointed to various posts by Iltutmish and successive Sultans of Delhi. He wrote a general history from the earliest times to A.D. 1259.

Zakariya Al Kazwini was born in Kazwin in Persia. He was not a traveller but compiled his works from other writings which he cited. He wrote around A.D. 1263 or 1275.

Rashiddun's *Jamiut Tawarikh* was completed in A.D. 1310. It was really the work of Al Biruni who had written almost four centuries earlier.

Abdullah Wassaf, the great historian of Shiraz, begins his work with the death of Mangu Khan and covers developments till the year A.D. 1328. His work is highly rated as a history on the Mongol dynasty; it has some references to India, particularly politics in the Pandyan kingdom.

Abul Feda (1273-1331) was a Syrian prince, who wrote several books including a universal history down to A.D. 1329. His *Taqwin ul Buldan*, a descriptive geography, contains information on India.

Ibn Battuta (d. 1377) was a Moorish scholar, who arrived in India in 1333. He held several posts under Sultan Muhammad bin Tughlaq and travelled extensively in the country. He left in 1344.

Shihabuddin al Umari (of Damascus), in his *Masalik –ul Absar,* has provided a very important account of India in the fourteenth century. His

work is based primarily on the accounts of reliable eye-witnesses. It provides valuable information about Muhammad bin Tughlaq.

al-Qalqashandi, an Egyptian scholar, based his work, the *Subh-ul Asha,* on information derived from the *Masalik –ul Absar.*

Sharafuddin Yazdi wrote a partial biography of Timur in A.D. 1424. As far as the Indian expeditions of Timur are concerned, it just embellishes the *Malfuzat-I Timuri*.

Abdur Razzak was the ambassador of Timur's son, Mirza Shah Rukh, to the Vijayanagar court in 1442.

Historians and histories of Sindh

The ***Chach-Nama*** deals with the usurpation of the Brahman Chach and the Arab conquest of Sindh. It was translated from the Arabic by Muhammad Ali in the time of Nasiruddin Kabacha. It is difficult to fix the precise period of the composition of the original text in Arabic. It appears to have been written before A.D. 753, when a significant section of the people were Buddhists.

Al Biladuri lived in the mid-ninth century at the court of Khalif Al Mutawakkal. He died around A.D. 892-93. His work contains an account of the first Arab conquests in Syria, Mesopotamia, Egypt, Persia, Armenia, Transoxiana, Africa, Spain and Sindh. His work is among the earliest Arab chronicles, and deals with events till A.D. 842. He does not appear to have visited Sindh, but cites the authors on whom he relied for information.

The unknown author of the ***Majmalut Tawarikh*** says that his father was the compiler of a historical work, and that he himself had written a history of the Barmekides. He informs us that he began his book in A.D. 1126. It covers events till A.D. 1193.

European travellers

Benjamin of Tudela (1159-73), a Spanish Jew, in the year 1159 or 1160 started from Tudela on a journey of thirteen or fourteen years during which he visited large parts of the known world.

Marco Polo, the celebrated Venetian, whose father and uncle had visited Central Asia between 1260 and 1271, started his journey in 1271. He reached the court of the Mongol, Kublai Khan after a hazardous journey of three and a half years. He stayed in China for 17 years and left in 1292. He visited parts of India on his way back home.

John of Monte Corvino (Italy) was the first of three monks who visited India soon after Marco Polo. John was a Franciscan friar who was sent as a missionary to China and subsequently appointed Archbishop of Peking by the Pope. He reached India in 1292 overland through Persia. From south India he crossed over to the Malay Peninsula and thence to Canton and Peking. He was the first European missionary to preach Christianity in India and China. With him begins the stream of Christian missionary criticism of Indian life and habits.

Odoric of Pordenone (probably German or Bohemian in origin and a friar of the Franciscan order), left home in 1316 to become a missionary in China. He went by sea from Italy to Trebizond on the coast of the Black Sea. From Ormuz he sailed to Salsette, near Bombay and reached Surat in about 1325. From Salsette he took a ship again to continue his journey to China. He sailed past the southern extremity of India to the vicinity of Madras, whence he crossed the Bay of Bengal to Sumatra and made his way past Java and Borneo till he reached China. He stayed in Peking for three years and returned to Europe through Tibet, Afghanistan, and Northern Persia.

Jordanus or Jordan, a French Dominican monk of Severac in south-west France, was sent by Rome to evangelize India in 1321. He was accompanied by three Italian friars and an Armenian lay brother. They followed the customary route by the Black Sea to Persia and the Persian Gulf, and thence to south-west India. According to his own statements, he was imprisoned four times in Muhammadan dungeons on the coast of India. His account of the Parsis is among the earliest by a foreigner.

Giovanni Dei Marignolli was sent by Pope Benedict XII with three other envoys to the great Tartar Khan then ruling China and Central Asia, and to the Christian princes of the Alan tribe of the Turks. After three years in Peking, they journeyed southwards down the coast of China in 1346 and

around the Malay Peninsula to Southern India. Marignolli stayed at Kulam in Travancore for sixteen months.

Nicolo Di Conti, a Venetian merchant, who had resided for some time at Damascus, and acquired fluency in Arabic, started on a journey to the East about 1430, taking his wife with him. For greater security for himself and his family, Conti posed as a Muhammadan. He traveled across Northern Arabia to Baghdad, thence to the Persian Gulf. In Persia, Conti learnt Persian and adopted the Persian dress. He came with some Persian merchants to Cambay from where he visited the great city of Vijayanagar. He returned to Venice in 1444, after an absence of twenty-five years. He dictated his narrative to Poggio Bracciolini, Secretary to Pope Eugenius IV.

Geronimo de Santo Stefano, a Genoese, at the close of the 15th century (1494-9) proceeded to India by way of the Red Sea. He followed much the same route as Conti and repeated many of his observations.

Athanasius Nikitin, a Russian, travelled to Persia and then to Gujarat. He stayed at Bidar and provides a vivid description of the Bahamani kingdom. His account of Vijayanagar, which he did not visit, is based on second-hand information.

Chinese travellers

Chou Kiu-fei, writing in A.D.1178, gave a valuable account of China's trade with other countries.

Chau Ju-kua, an inspector of foreign trade, compiled his work about A.D.1225. He has provided one of the most valuable notices on the kingdoms of South India.

Wang Ta –Yuan, a Chinese merchant, was a contemporary of Ibn Battuta. He visited foreign countries for purposes of trade.

Ma Huan was a Chinese Muslim interpreter to the expedition of 1412-1413. His work was first published in 1451.

Cheng Ho, a eunuch, was a Mussalman and the son of a *hajji*. He was accompanied in his voyages by Fei Hsin, whose account dated 1436 has survived.

Ma Twan-lin wrote in the mid-thirteenth century.

A. Some Descriptions of the Land

1. Isidore of Seville on eastern geography [c. 638 A.D.][1]

India derives its name from the river Indus, by which it is enclosed on the West. It stretches out from the southern area to the rising of the sun, and it extends on the North as far as the Caucasus mountain. It has many nations, towns and also the land of Taprobane which is filled with elephants. It has (the islands of) Chryse and Argyra which are rich in gold and silver, and also (the island of) Tyle which is never wanting in foliage. It has both rivers Ganges and Indus and Hyphasis which make the Indian famous…

2. Comparison of India and China, *Akhbar Al-Sin wa'l Hind,* An Account of China and India[2]

India is much more spacious than China and is twice the size of the latter and the numbers of its kings are more [than those of China]. But China is more populated. Date palm is neither found in China nor in India [?], but they have the rest of the trees and fruits which we do not have. In India there are no grapes, while in China it is found in small quantities, but other fruits are found in abundance. They have more pomegranates in India [than in China]…

The rivers in both the countries are all of huge sizes: some of these are larger than our rivers. Rainfall throughout the two countries is heavy. In India there are many deserts while China is entirely populated.

3. The country about Cape Comorin, Abu Zaidu-l Hasan of Sira[3]

Among the stories which are current in the country (of Zabaj) [Java] about ancient times, there is one concerning a king of Kumar, the country which produces the aloes called kumari. This country is not an island, but is

situated (on the continent of India) on that side which faces the country of the Arabs.

4. Vast country, Al Masudi[4]

India is a vast country, extending over sea, and land, and mountains; it borders on the country of Zabaj [Java], which is the kingdom of the Maharaj, the king of the islands, whose dominions separate India and China, but are considered as part of India. India extends on the side of the mountains to Khurasan and Sind, as far as Tibet.

5. State of India, John of Monte Corvino in a letter written 22 December 1310[5]

The condition of the country of India aforesaid is this. The land is well enough peopled; and there be great cities therein, but the houses are wretched, being built of sandy mud, and usually thatched with leaves of trees. Hills there are few; rivers in some places are many, in others few. Springs there are few or none; wells in plenty; and the reason is this, that water is generally to be found at the depth of two or three paces, or even less. This well water is indeed not very good to drink, for it is somewhat soft and loosens the bowels; so they generally have tanks or excavations like ponds, in which they collect the rain water, and this they drink.

6. The Russian version of the letter reportedly sent by the Indian priest-king Prester John to the Greek ruler, Manuel Commenus, appeared in early thirteenth century. It was called, *The Story of the Indian Kingdom, of the great and famous state and all its wonders: how great its territory is, how many wonders and treasures there are and what its people, animals, birds and all sorts of jewels are like*[6]

[There were] wild elephants, unicorns, aurochs with golden horns, camels and all kinds of ferocious beasts…pepper grew there and there was a precious stone called emerald…an abundance of everything…[but] neither thief nor bandit nor envious person [were to be found].

7. Eulogium upon the Countries of Hind, Abdullah Wassaf[7]

India, according to the concurrent opinion of all writers, is most agreeable abode on the earth, and the most pleasant quarter of the world. Its dust is purer than air, and its air purer than purity itself; its delightful plains

resemble the garden of Paradise, and the particles of its earth are like rubies and corals…

It is related by sufficient informants, experienced travellers, who have long fixed their staff in the country of Hind and raised the standards of enquiry and research, that the length, breadth, and the number of its most celebrated provinces are as follows: Malibar, from the borders of Khor to the country of Kulam, is about 300 parasangs; that Bula, from the beginning of Kambayat to the borders of Malibar, is more than 400 parasangs; that Sawalik contains 125,000 cities and villages; and Malwa 1,893,000 towns and villages.

8. Cannot be compared with any other country, Shihabuddin al Umari[8]

This is a most important country which cannot be compared with any other country in the world in respect of its extensive territories, its abounding wealth and numerous armies, the grandeur of its Sultan [Muhammad bin Tughlaq] when he travels or is in residence and in respect of the might of his empire. The fame and renown of this country is well known.

…it is the country in whose seas there are pearls and in whose land there is gold, and in whose mountains there are rubies and diamonds, and in whose valleys there is aloe-wood and camphor, and in whose cities there are the thrones of the kings. Among its animals there are elephants and rhinoceros; from its iron are made the Indian swords; in it there are mines of iron, quick-silver and lead, and from some of its places there comes saffron, and in some of its valleys there are crystals; in it the good things of life are in abundance, prices here are cheap; its armies are numberless, and its territories are limitless.

9. Length of country three years by ordinary journey, Shihabuddin al Umari[9]

The learned and blessed Shaikh [Mubarak-Ibn-i-Mahmud al-Khambati]… says that this country is extremely extensive so that its length is three years by ordinary journey and its width is also three years, and its latitude is that which lies between *Somnat* and *Sarandib* [Ceylon] up to Ghazna and its longitude from the *Bay apposite to Aden* to the *Wall of Alexander* [the Great Wall of China] where the Indian Ocean meets the Atlantic Ocean. There are

closely situated towns with *mimbars,* thrones and districts, villages, market-places and bazars. No desolated place comes between them…

10. Healthy country, Shihabuddin al Umari[10]

I say: The Qadi Nizamuddin Yahya bin-Hakim brought to my knowledge an old work on the country. In it is mentioned that the whole of Multan consists of 1,26,000 villages (recorded) in the Diwan. Multan and Delhi are situated in the 3rd climate while the greater part of the country is situated in the 2nd and 3rd climates. It is a large country and is healthy except the rice growing fields. They are unhealthy and the low-lands are unwholesome. It is related in the same work that Mubarak b. Yusuf ath-Thaqafi obtained in Sind 40 *behar of gold,* every behar consisting of 333 *mann.* He said: From the countries of Ghazna and Qandhar (begin) the frontiers.

I inquired from Shaikh Mubarak about the mainland of India and the borderlands. He replied to me: in it there are about 1000 rivers, big and small, some of which resemble the Nile in length, others are smaller than it, others are still smaller and others are like the ordinary rivers. On the banks of the rivers are villages and cities and dense trees and verdant meadows…

11. Abundance of aromatic plants, *Subh-ul-A'sha*[11]

The author of *Masalik ul Absar* [Ibn Fazullah ul-Umari]…says, "in their mountains and islands there grow the trees of aloes-wood and camphor and all sorts of aromatic plants e.g. clove tree, spikenard (sunbul), dar-chini, Cinnamon (girfa), salikha, cardamom (qaqullah), cubeb, mace and many kinds of drugs of vegetable origin (aqaqir). And they have musk deer and civet cat. This together with all that is found in this country is on account of the extensiveness of the provinces, the remoteness of the sides and the distance of its boundaries.

12. Boundaries of India, Abul-Fida, the fourteenth century Syrian prince-geographer[12]

India is surrounded on the west by the Sea of Fars and the rest of it are the borders of Sind and the parts adjacent to it; on the south it is surrounded by the Indian Ocean; on the east by a desert, which separates India from China; and on the north by (the lands of the Turkish clans).

13. Extensive areas, Marvazi[13]

Their lands are numerous, with extensive areas, and the outlying parts of them are far-flung, stretching as they are down to the limit of habitation where cultivation and procreation cease and the existence of animals comes to an end.

14. Wealth of India, Timur[14]

…the Prince Muhammad Sultan said: "The whole country of India is full of gold and jewels, and in it there are seventeen mines of gold and silver, diamond and ruby and emerald and tin and iron and steel and copper and quicksilver, etc., and of the plants which grow there are those fit for making wearing apparel, and aromatic plants, and the sugar cane, and it is a country which is always green and verdant, and the whole aspect of the country is pleasant and delightful. Now, since the inhabitants are chiefly polytheists and infidels and idolaters and worshippers of the sun, by the order of God and his prophet, it is right for us to conquer them."

15. Ibn Majid, in a work dated 1489-90, on navigation which shows that Malaka was then in regular communication with India, Southern Arabia and the Red Sea[15]

As to what concerns the entry to Malaka while coming from Kalikut, sometimes the monsoon scatters the ships and sometimes carries them beyond it. The only exception is in the case of the well-armed ships coming from Campa, ready to set sail at the commencement of niruz or about that time. The monsoon brings back to Malaka ships from Hormuz and from Mekka and the late ships enter there (Malaka) on the 120th (day of niruz).

16. Pedro Covilham, who left Lisbon in May 1487 and was the first Portuguese to sail on the Indian Ocean on a Moorish ship and visit Cananore, Calicut and Goa, sent back the following report to King John[16]

That the ships which sailed down the coast of Guinea might be sure of reaching the termination of the continent, by persisting in a course to the south; and that when they should arrive in the eastern ocean, their best direction must be to inquire for Sofala, and the Island of the Moon [Madagascar].

17. Vasco da Gama comes in search of Christians and spices[17]

[Calecut] *[Arrival.]* That night [May 20] we anchored two leagues from the city of Calecut, and we did so because our pilot mistook *Capua,* a town at that place, for Calecut. Still further there is another town called *Pandarani.* We anchored about a league and a half from the shore. After we were at anchor, four boats *(almadias)* approached us from the land, who asked of what nation we were. We told them, and they then pointed out Calecut to us.

On the following day [May 21] these same boats came again alongside, when the captain-major sent one of the convicts to Calecut, and those with whom he went took him to two Moors from Tunis, who could speak Castilian and Genoese. The first greeting that he received was in these words: "May the Devil take thee! What brought you hither?" They asked what he sought so far away from home, and he told them that we came in search of Christians and of spices.

18. King Manuel, in a letter of July, 1499, relaying news of the Portuguese arrival in India to King Ferdinand and Queen Isabella, his recently acquired parents-in-law[18]

We learn that they did reach and discover India and other kingdoms and lordships bordering upon it; that they entered and navigated its sea, finding large cities, large edifices and rivers, and great populations, among whom is carried on all the trade in spices and precious stones…Of these they have brought a quantity, including cinnamon, cloves, ginger, nutmeg, and pepper, as well as other kinds, together with the boughs and leaves of the same; also many fine stones of all sorts, such as rubies and others.

SOME REGIONS OF INDIA

1. The Laccadive and Maldive Islands, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[19]

The third sea is the Sea of Harkandh [from Sanskrit *Harikeliya*, Bay of Bengal]. Between it and the Sea of Larvi there are numerous islands. It is said that they are one thousand and nine hundred islands, and they mark the boundaries of these two seas, namely Larvi [Lata for Gujarat] and Harkandh...

In these islands, ruled by the woman, coconut palms grow in abundance. The distance between one island and the other is two, three or four *farsakh,*

and each one of these is inhabited by people and has coconut palms. Their wealth consists of cowry shells and the queen hoards them in her treasury… The cowry shell comes above the surface of water when it is alive; so a branch of the coconut palm is taken and thrown on the surface of the water, and the cowry shell clings to it. They call it *al-kastaj.*

2. Multan, Al Masudi[20]

Multan is seventy-five Sindian parasangs from Mansura. Each parasang is eight miles. The estates and villages dependent on Mansura amount to three hundred thousand. The whole country is well cultivated, and covered with trees and fields.

3. Dabul [a famous seaport of Sind on the site of modern Karachi, named after a Buddhist temple *devalya*, destroyed by Muslims in A.D. 711], *Subh-ul-A'sha*[21]

Daybul: It is a city on the sea-shore situated in the second of seven climates…Ibn Sa'id says, "it lies on an entrance to the inland in the Bay of Sind and is the biggest and the most famous of the sea-ports of Sind and the articles of Daibul are exported from it." The author of *Taqwim ul-Buldan* mentions, that in it are found plenty of sesam…

4. Makran, Ibn Haukal[22]

Makaran contains chiefly pasturages and fields, which cannot be irrigated on account of the deficiency of water.

5. Budha [Sind], *Subh-ul-A'sha*[23]

Ibn Hauqal says, "it lies between the boundaries of Turan, Mukran and Multan and the cities of Mansura; it lies on the western side of the river Mihran. Its people have camels like the Bedouins; they live in huts and booths."

6. Janani [Sind], Ibn Battuta[24]

After crossing the river of Sind called Panj Ab, our way led through a forest of reeds, in which I saw a rhinoceros for the first time. After two days' march we reached Janani, a large and fine town on the bank of the river of Sind. Its people are a people called the Samira [probably Rajput Sammas], whose ancestors established themselves there on the conquest of Sind in the time of al-Hajjaj [712 A.D.]. These people never eat with

anyone, nor may anyone observe them while they are eating, and they never marry outside their clan.

7. Sehwan, Ibn Battuta[25]

From Janani [Sind] we travelled to Siwasitan [Sehwan], a large town, outside which is a sandy desert, treeless except for acacias. Nothing is grown on the river here except pumpkins, and the food of the inhabitants consists of sorghum and peas, of which they make bread. There is a plentiful supply of fish and buffalo milk, and they eat also a kind of small lizard stuffed with curcuma.

8. Marvels of some places, Gardizi[26]

The towns in which (*andar u*) these marvels are produced or found are situated from Quandahar (Gandhara) towards Kashmir, and also in (?) the province of Ganges (*Gang*). One of these towns is JALLANDHAR, in whose province is found much myrobalam, *terminalia bellerica, embilica officinalis*, and the *jashak* tree. The Indians say that a king of this country would live up to 250 years, while at any time he would ride, hunt, and have intercourse with women, just like young men, all this being due to medicines and wiles (*hila*)....

CHITRAKOT, which produces *shaytara yi hindi* while in its mountains there are numerous *jashak* trees and other things; here is the abode of the great men (nobles ?) and here their sages learn charms and every science. The towns UJJAYNI (*sic*) belongs to the worshippers of Mahakali and the astronomical tables of 'Arkand' were calculated from its longitude. In it are situated numerous repositories of books and wisdom.

9. Sindbad the Sailor's voyages may have been imaginary but were based on the knowledge of the Arabs of the time[27]

Thence we sailed to the island of pepper and to the peninsular of Comorin, in which is found the aloes wood, called *santy*. Thence we went to the pearl fisheries. I made a bargain with the divers, who brought me up a considerable number of beautiful pearls, and God heaped me with blessings…

10. Pearls in Malabar, Chau Ju-Kua[28]

The Nan-p'i country [the country of Nairs, Malabar] is in the extreme south-west. From San-fo-ts'i one may reach it with the monsoon in a little

more than a month. The capital of the kingdom is styled Mie-a-mo [Malabar], which has the same meaning as the Chinese expression *li-ssi* [priests]…

The climate is warm; there is no cold season. Rice, hemp, beans, wheat, millet, tubers and green vegetables supply their food; they are abundant and cheap…

The native products include pearls,…and *tou-lomien* (cotton cloth)…

11. Chinese come to trade in Nan-pi [Malabar], Ma Twan-lin[29]

The inhabitants of Nan-pi are very warlike. They manage skillfully the saber and the lance. They are shrewd archers. They know to mint and strike silver coins with alloy which bear the royal seal of the State and which serve as currency for commerce. They fish for pearls and make cotton cloth of all colours. Because of its distance, this country lived without any relation with China, when two merchants who were natives of the land and who were called Chi-lo-pa-tchi-li-yu, father and son, came to establish themselves in the centre of the town of Tsiouen-tcheou (of Fo-kien). After this, many Chinese vessels took the route to Nan-pi in order to carry on trade.

12. Quilon - land of spices, Rabbi Benjamin Of Tudela[30]

The pepper grows in this country; the trees which bear this fruit are planted in the fields, which surround the towns, and everyone knows his plantation. The trees are small and the pepper is originally white, but when they collect it, they put it into basins and pour hot water upon it; it is then exposed to the heat of the sun and dried in order to make it hard and more substantial; in the course of which process it becomes of a black colour. Cinnamon, ginger and many other kinds of spices also grow in this country.

13. Malabar, Abulfeda[31]

All Malabar is covered with forest and with trees entangling one another, thanks to the abundance of water. From Hannaur [Honavar] one goes to Basarour (Barcelore), a small place; beyond it, one comes to Manjarur (Mangalore), one of the largest towns of Malabar. Its king is an infidel. Manjarur is to the East of the localities already mentioned. After a three days' journey from Manjarur, one comes across a big mountain which projects into the sea and is seen by sailors from a distance; it is called Ra's Haili (promontory of Illy). At the extremity of Malabar we have Tandiyur, a

small place to the east of Ra's Haili, and there we find many gardens. The other localities of Malabar are Schaliyat (Jaliat) and Schinkili. One of these places is inhabited by Jews, but the narrator has omitted to note which. Kaulam is the last town of Malabar, the pepper country.

Cape Comorin

The first locality in the Coromandel from the side of Malabar is Ra's Komhori (Cape Comorin), mountain and town. Another town of Coromandel, Manifattanis, situated on the coast. The capital of Coromandel is Biyyardawal. It is the residence of the Sultan of Coromandel. Horses are brought to him from other countries.

Coromandel [Ma'bar]

The Coromandel, says Ibn Said, is celebrated by the reports of travellers. It is from there that they export muslin which has passed into proverb for its fitness. To the north lie the mountains adjacent to the country of Balhara, who is one of the kings of India; to the west the river of Suliyan falls in the sea. The Coromandel is three or four days' journey to the East of Caoulem. I should add that this ought to be with an inclination toward the south.

Caoulem [Kaulam]

Caoulem, says Ibn Said, is the last town in the pepper country towards the east. One sets sail from this town in order to go to Aden. A traveller has told me that Caoulem is a town situated on a gulf at the very end of the pepper country and that it includes a quarter for the Mussalmans and a Mosque. The town is built on a Sandy Plain. The orchards there are always numerous. One notices the *boqqam* tree (Brazil) which looks like a pomegranate and whose leaf is like that of a Jujube tree.

14. Calicut, Girolamo Sernigi, the Florentine merchant, in a letter to a colleague in Florence in July 1499[32]

[Calicut is] bigger than Lisbon, and peopled by Christian Indians…[The Zamorin of Calicut] keeps regal state…[The vessels in the harbour] carry neither arms nor artillery…in payment they [the Calicut merchants] only take gold and silver; coral and other merchandise of our parts they esteem but little…

15. Abundant Gujarat, Abdullah Wassaf[33]

Gujarat, which is commonly called Kambayat, contains 70,000 villages and towns, all populous, and the people abound in wealth and luxuries. In the course of the four seasons of the year seventy different species of beautiful flowers grow within that province. The purity of its air is so great that if the picture of an animal is drawn with the pen, it is life-like. And it is another matter of wonder that many plants and herbs are found wild and uncultivated there. You may always see the ground full of tulips even in the winter season. The air is healthy and the earth picturesque, neither too warm nor too cool, but in perpetual spring. The winter cultivation is brought about only through the moistness of dew, called *barasi.* When that harvest is over they begin summer cultivation, which is dependent upon the influence of the rain. The vineyards in this country bring forth blue grapes twice a year; and the strength of the soil is so great that the cotton plants spread their branches like willows and plane trees, and yield produce for several years successively.

Had the author full leisure to express fully the circumstances of that country, and to ascertain them from trustworthy men and historians, and to devote a long period of his life to explain them, still he would not be able to record even a portion of the marvels and excellences of that country.

16. Incomparable Kashmir, Timur[34]

Kashmir is an incomparable country…In the midst of that country there is a very large and populous city called Naghaz. The rulers of the country dwell there. The buildings are very large and are all of wood, and they are four or five stories high. They are very strong and will stand for 500 or 700 years. A large river runs through the middle of this city, as large as the Tigris at Baghdad, and the city is built upon both sides of it. The source of this river is within the limits of Kashmir in a large lake, some *parasangs* in length and breadth, which is called Vir-nak. The inhabitants have cast bridges over the river in nearly thirty places. These are constructed of wood, stone, or boats; seven of the largest are within the city, and the rest in the environs…

17. Bengal – a hell full of good things, Ibn Battuta[35]

This is a vast country, abounding in rice, and nowhere in the world have I seen any land where prices are lower than there; on the other hand it is a gloomy place, and the people of Khurasan call it “A hell full of good

things." I have seen fat fowls sold there at the rate of eight for a single dirham, young pigeons at fifteen to the dirham, and a fat ram sold for two dirhams. I saw too a piece of fine cotton cloth, of excellent quality, thirty cubits long, sold for two dinars, and a beautiful slave-girl for a single gold dinar, that is, two and a half gold dinars in Moroccan money. The first city in Bengal that we entered was Sudkawan [Satgaon or Chittagong], a large town on the coast of the great sea. Close by it the river Ganges, to which the Hindus go on pilgrimage, and the river Jun [Jumna, here obviously the Brahmaputra] unite and discharge together into the sea. They have a large fleet on the river, with which they make war on the inhabitants of the land of Laknawti.

18. Among the early Spaniards to write a travel narrative of India was an anonymous Franciscan monk who in the mid-fourteenth century wrote *Book of the knowledge of all the Kingdoms, Lands, and Lordships That Are in the World* [36]

It contains extensive lands, very rich and populous. The cities I came to were nine, called *Noncla* and *Chequimo, Demonela, Coximocha, Granbaet, Ganarrac, Mahobar, Gomar* and *Colon.* Know that in this kingdom...the pepper and ginger and aloe ripen, and many other spices, of which there are great harvests which are taken over all the world.

They call this province India the sandy [Sind and Rajputana], and the colour of the people is black. They use Turkish bows. They are wise people with good memories, and learned in all kinds of knowledge. The device of the King is a white flag with a gold pale.

I departed from the kingdom of *Dilini* and entered that of *Viguy* [Vijayanagar?] which is on the other coast of the Indian Sea. It is a very rich land, well supplied with all good things. The cities which I visited in the kingdom of *Viguy* were *Panona, Framisia. Tusi, Artillo, Corsa, Rusna, Armonea, Androuar, Moncaspi,* and *Pascar.*

...This kingdom of *Scim* [the India beyond the Ganges], is in India the high, which borders on the eastern sea. And from this kingdom of *Scim* comes the great mountain *Caucasum* which extends from the eastern sea to India the low. The kingdom of *Trimic* [Tibet] is all surrounded by mountains which give rise to many fountains and rivers. This land has a

very healthy climate…so that those who are born and live here have very long lives.

RIVERS AND SEAS

1. The Mihran [Indus] river in Sind, Al Masudi[37]

The river Mihran takes its course through the country of Mansura, and falls near Debal into the Indian Ocean. In the bays of this sea there are many crocodiles, as in the bay of Sindabur in the kingdom of Baghara [Balhara], in India; the bay of Zabaj, in the dominions of the Maharaj, and the gulfs of the aghyab [aghbab], which extend towards the island of Sarandib [Ceylon]. Crocodiles live more particu-larly in sweet water, and, as we have said, in the estuaries of India, the water of which is for the most part sweet, because the streams which form them are derived from the rains.

2. The Sea of India, John of Monte Corvino[38]

The state of things in regard to the Sea of India is this. The sea aboundeth greatly with fish; and in some parts of it they fish for pearls and precious stones. The havens are few and bad; and you must know that the sea here is the Middle Sea or Ocean. Traversing it towards the south there is no continent found but islands alone, but in that sea the islands are many, more than 12,000 in number. And many of these are inhabited, and many are not…

The shores of the said sea in some places run out in shoals for 100 miles or more so that ships are in danger of grounding. And they cannot make the voyage but once a year, for from the beginning of April till the end of October the winds are westerly, so that no one can sail towards the west; and again ’tis just the contrary from the month of October till March. From the middle of May till the end of October the wind blows so hard that ships which by that time have not reached the ports whither they are bound, run a desperate risk, and if they escape it is great luck. And thus in the past year there perished more than sixty ships; and this year seven ships in places in our own immediate neighbourhood, whilst of what has happened elsewhere we have no intelligence.

3. Meghna River, Ibn Battuta[39]

I journeyed to Habanq, an exceedingly large and beautiful city, traversed by the river, which descends from the Kamaru mountains. This river is

called the Blue River, and is used by travellers to Bengal and Laknawti. On its banks there are water wheels, orchards, and villages to right and to left, like the Nile in Egypt. Its people are infidels under Muslim rule, who are mulcted of half their crops and pay taxes over and above that. We traveled down the river for fifteen days between villages and orchards, just as if we were going through a bazaar. There are innumerable vessels on it and each vessel carries a drum; when two vessels meet, each of them beats its drum and they salute one another.

B. Climate

1. Winter in India, Al Masudi[40]

Anyone who passed winter in India during the season when we have summer in our country, it is said, 'so and so passed winter (*yassara)* in India.'

2. Climate of Mabar, John of Monte Corvino[41]

In India it is always warm, and there never is any winter; yet the heat is not extravagant. And the reason is, that there be at all times winds which temper the heat of the air. And the reason why there can be no winter is the position of the country with respect to the zodiac, as I shall now tell. That is to say, the sun when entering *Virgo, i.e.* on the 24th day of August, sends down his rays, as I have seen and in particular noted with my own eyes, quite perpendicularly, so as to cast no shadow on either side. And in like manner when he is entering *Aries, i.e.* at the end of March. And when he has gone through *Aries* he passes onwards the north, and casts shadows towards the south until...[the summer solstice] and then turns to *Virgo,* and after he has past through the sign of *Virgo* he then casts his shadow towards the north. And thus there is never so great an elongation of the sun as to admit of cold, and there are not two seasons. Or, as I have said before, there is no winter or cold season.

3. Climate temperate, Shihabuddin al Umari[42]

India has a temperate climate, the conditions of the seasons of which do not much change. It is neither extremely hot nor cold as if all the time were spring. In this (country) wind and pleasant zephyr gently blow. The rains fall continually for a period of four months, mostly towards the end of spring till the beginning of summer.

4. Heat 'perfectly horrible' in India the Less [includes Sindh, and probably Makran and India along coast as far as some point immediately north of Malabar], Friar Jordanus[43]

The days and nights do not vary there more than by two hours at the most...The heat there is perfectly horrible, and more intolerable to strangers that it is possible to say.

5. Days and nights are almost equal in India the Greater [extends from Malabar eastwards], Friar Jordanus[44]

In this Greater India, in the place where I was, the nights and days are almost equal, nor does one exceed the other in length at any season by so much as a full hour. In this India the sun keeps to the south for six months continuously, casting the shadows to the north; and for the other six months keeps to the north, casting the shadow to the south. In this India the Polestar is seen very low, insomuch that I was at one place where it did not show above the earth or the sea more than two fingers' breadth.

There the nights, when the weather is fine and there is no moon, are, if I err not, four times as clear as in our part of the world. There also, if I err not, between evening and morning, often all the planets may be seen; there are seen their influences (as it were) eye to eye, so that 'tis a delightful thing there to look out at night!'

From the place aforesaid is seen continually between the south and the east a star of great size and ruddy splendour, which is called Canopus, and which from these parts of the world is never visible. There are many marvelous things in the cycle of those (heavenly bodies) to delight a good astronomer.

6. A hot land, anonymous Franciscan monk of the *Book of the knowledge of all the Kingdoms, Lands, and Lordships That Are in the World* [45]

[Speaking of Scim, the India beyond the Ganges] Beyond these are the people of India who are near the equinoctial line. Their land is very hot. Most of their towns are on the sea shore and there are many islands. So that the air receives moisture from the sea, and tempers the dryness and heat. In this way are formed beautiful bodies and graceful forms, with fine hair; which are not produced by the heat except that it produces dark colour.

India the high is bounded by the eastern sea which is called Mare Sericum or Mare Cansasus.

7. Climate in Cochin, Ma Huan[46]

In this country there are two seasons, the wet and the dry. In the first two months of the rainy season there are only passing showers, during which time the people lay in a stock of provisions: in the next two months there is a continual downpour day and night, so that the streets and market places are like rivers, and no one is able to go out of doors; during the last two months the rain gradually ceases, and then not a drop falls for another six months. The soil is unproductive, pepper, however, grows on the hills and is extensively cultivated; this article is sold at five taels the Po-ho which is 400 cattis of Chinese weight.

C. Nature's Bounty – Flora and Fauna

FLORA

1. Coconut wine in the Nicobar Islands, Sulaiman[47]

…if it is drunk soon after it is extracted from the coconut tree, it is as sweet as honey, but if it is left for an hour it turns into wine, and if it is left for several days it turns into vinegar.

2. Trees at Mansura, Abu Ishak al Istakhri[48]

The date tree and the sugar cane grow here. The land of Mansura also produces a fruit of the size of the apple, which is called Laimun [sour lemon], and is exceedingly sour. The land also produces a fruit called Ambaj (mango), which is like the peach. The price of them is low, and they are plentiful.

3. A wide variety of trees, John of Monte Corvino[49]

And they have trees which produce fruit continually, so that on them you find fruit in every stage up to perfect ripeness at one time. In like manner they sow and reap at almost all seasons, and this because it is always warm and never cold. Aromatic spices are to be had good cheap, some more so and some less so, according to what spices they be. They have trees that produce sugar, and others that produce honey, and others that produce a liquor that has a smack of wine. And this the natives of those countries use

for drink. And those three things are to be had at very small cost. And the pepper plant is here also. It is slender and knotty like a vine; and indeed 'tis altogether very like a vine, excepting that it is more slender, and bears transplanting.

Ginger is a reedlike plant, and, like a cane-root, it can be dug and transplanted. But their canes here are more like trees, being sometimes a cubit in girth and more, with slender prickly branches round about, and small leaves.

The Brazil tree is a slender lofty and thorny tree, all red as it were, with leaves like fern. The Indian nuts are as big as melons, and in colour green like gourds. Their leaves and branches are like those of the date tree.

The cinnamon is of a medium bulk, not very high, and in trunk, bark, and foliage, is like the laurel; indeed, altogether it resembleth the laurel greatly in appearance. Great store of it is carried forth of the island which is hard-by Maabar [among the earliest references to the Ceylon cinnamon trade].

4. Many kinds of grains and fruits, Shihabuddin al Umari[50]

In it are many kinds of grains, wheat, rice, barley, peas, lentils, mash [Indian peas], lobiya [haricot] and sesame. As regards broad beans (ful), they are hardly found there. I say I think the absence of broad beans is due to the fact that it is a country of philosophers and according to them the beans spoil the essence of the intellect. Therefore, the Sabeans too have forbidden the use of them. He said: In it there are fruits; figs, grapes, plenty of pomegranates, sweet, sour and acid, bananas, peaches citron, lemon, lime, orange, sycamore, black mulberries which are called 'firsad', water-melon (Khiyar), yellow and green cucumber (qiththa) and melon. Figs and grapes are found in smaller quantities than the other fruits. As regards the quince it is found there and (also) imported to this (country). As regards pears and apples they are still rarer than quince. There are other fruits which are not known in Egypt, Syria, and Iraq; mangoes and mahwal and laha and naqhzak and other excellent and delightful fruits. As regards the coconut which is called 'Indian nut' no other thing can be compared to it and it is green and full of oil. As regards the *hammar,* it is called the 'Indian Tamarind.' It is a wild tree growing in abundance on the mountains. Coconut and bananas are less plentiful in Delhi than in neighbouring provinces where they are found in large quantities. Sugarcane is generally

found in plenty throughout the country. One of it is of a black variety which is bad as regards its cane. It is the best (variety) for chewing but not for crushing; it is not found elsewhere. From other varieties sugar is prepared in large quantities and is cheap as candy and the ordinary sugar. But it does not crystalise and is rather like white flour.

According to the report of Sheikh Mubarak bin Muhammad Shadhan there are in this country twenty-one varieties of rice. They have also turnips, carrots, pumpkin (vegetable marrow), badinjan (egg plant), asparagus, and ginger. They cook it when it is still green in the same manner as the carrot is cooked and it has an exquisite taste with which nothing can be compared. And there is also garden-beet, onion (garlic fum), fennel, thyme, and sweet smelling plants as rose, water-lily, violet, ban (nutmeg), and this is the same as Khallaf. Egyptian willow, narcissus, and this is (also called) abbar, narcissus, Jesamine, henna plant and this is faghiya. Similarly there is sesame oil and they use it for lighting purposes.

As regards olives they are obtained only by import. Honey is extremely abundant. Wax is only found in the palaces of the Sultan and its use is not allowed to anybody.

5. Trees and fruits in India the Less, Friar Jordanus[51]

In the entrance to India the Less are (date) palms, giving a great quantity of the sweetest fruit; but further on in India they are not found…There be always fruits and flowers there, divers trees, and fruits of divers kinds; for (example) there are some trees which bear very big fruit, called *chaqui* [jackfruit]; and the fruit is of such size that one is enough for five persons.

There is another tree which has fruit like that just named, and it is called Bloqui, quite as big and as sweet but not of the same species. These fruits never grow upon the twigs, for these are not able to bear their weight, but only from the main branches, and even from the trunk of the tree itself, down to the very roots.

Mango

There is another tree which has fruit like a plum, but a very big one which is called Aniba [mango]. This is a fruit so sweet and delicious as it is impossible to utter in words.

There be many other fruit trees of divers kinds, which it would be tedious to describe in detail…

Coconut

First of these is a certain tree called *Nargil* [cocoanut]; which tree every month in the year sends out a beautiful frond like (that of) a (date), palm-tree, which frond or branch produces very large fruit, as big as a man's head. There often grow on one such stem thirty of those fruits as big as I have said. And both flowers and fruits are produced at the same time beginning with the first month and going up gradually to the twelfth; so that there are flowers and fruit in eleven stages of growth to be seen together. A wonder! And a thing which cannot be well understood without being witnessed. From these branches and fruits is drawn a very sweet water. The kernel (at first) is very tender and pleasant to eat; afterwards it waxeth harder still, an oil is made from it of great medicinal virtue. And if anyone careth not to have fruit, when the fruit-bearing stem is one or two months old he maketh a cut in it, and bindeth a pot to this incision; and so the sap, which would have been converted into fruit, drops in; and it is white like milk, and sweet like must, and maketh drunk like wine, so that the natives do drink it for wine; and those who wish not to drink it so, boil it down to one-third of its bulk, and then it becometh thick, like honey; and 'tis sweet, and fit for making preserves, like honey and the honeycomb. One branch gives one potful in the day and one in the night, on the average throughout the year; thus five or six pots may be found hung upon the same tree at once. With the leaves of this tree they cover their houses during the rainy season. The fruit is that which we call *nuts of India;* and from the rind of that fruit is made the twine with which they stitch their boats together in those parts.

Palmyra

There is another tree of a different species, which like that gives all the year round a white liquor pleasant to drink, which tree is called Tari [tadi]. There is also another, called *Belluri,* giving a liquor of the same kind, but better.

Banyan

There be also many other trees, and wonderful ones; among which is one which sendeth forth roots from high up, which gradually grow down to the ground and enter it, and then wax into trunks like the main trunk, forming as it were an arch; and by this kind of multiplication one tree will have at

once as many as twenty or thirty trunks beside one another, and all connected together. 'Tis marvelous! And truly this which I have seen with mine eyes, 'tis hard to utter with my tongue. The fruit of this tree is not useful, but poisonous and deadly. There is (also) a tree harder than all, which the strongest arrows can scarcely pierce.

The trees in this India, and also in India the Greater, never shed their leaves till the new ones come.

To write about the other trees would be too long a business; and tedious beyond measure; seeing that they are many and divers, and beyond the comprehension of man…

Ginger

In this India there is green ginger, and it grows there in great abundance.

There be also sugarcanes in quantities; carobs also, of such size and bigness that it is something stupendous. I could tell very wonder-ful things of this India; but I am not able to detail them for lack of time. Cassia fistuala [an inferior cinnamon] is in some parts of this India extremely abundant…

There is no pepper there, nor any kind of spice except ginger.

6. Spices in India the Greater, Friar Jordanus[52]

In this India there are pepper and ginger, cinnamon, brazil [sappan-wood], and all other spices.

Ginger is the root of a plant which hath leaves like a reed. Pepper is the fruit of a plant something like ivy, which climbs trees, and forms grape-like fruit like that of the wild vine. This fruit is at first green, then when it comes to maturity it becomes all black and corrugated as you see it. 'Tis thus that long pepper is produced, nor are you to believe that fire is placed under the pepper, nor that it is roasted, as some will lyingly maintain.

Cinnamon is the bark of a large tree which has fruit and flowers like cloves.

7. World's pepper produced in Quilon, John De Marignolli[53]

And sailing on the feast of St. Stephen, we navigated the Indian sea until Palm Sunday, and then arrived at a very noble city of India called *Columbum,* where the whole world's pepper is produced. Now this pepper grows on a kind of vines, which are planted just like in our vineyards. These vines produce clusters which are at first like those of the wild vine, of

a green colour, and afterwards are almost like bunches of our grapes, and they have a red wine in them which I have squeezed out on my plate as a condiment. When they have ripened, they are left to dry upon the tree, and when shrivelled by the excessive heat the dry clusters are knocked off with a stick and caught upon linen cloths, and so the harvest is gathered.

These are things that I have seen with mine eyes and handled with my hands during the fourteen months that I stayed there. And there is no roasting of the pepper, as authors have falsely asserted, nor does it grow in forests, but in regular gardens; nor are the Saracens the proprietors but the Christians of St. Thomas. And these latter are the masters of the public steel-yard, from which I derived, as a perquisite of my office as Pope's legate, every month a hundred gold *fan,* and a thousand when I left.

8. Hili – "impossible to state the number of plants which cover the hills," Wang Ta-Yuan[54]

This country is between Hsiao Ku-nan (Kain Colan) and Ku-li-fo (Calicut) [Mt. Ely is actually north of Calicut], it is also known (to the Chinese) as the Hsiao Chiang- keou, or 'Little Harbour.' The hill is bare and flat, it extends over several thousand *(sic) li.*

The dwellings of the people are scattered about close together on every side with a sufficiency of land to supply the wants of each family, though the soil is far from good for tilling...

The natural products are pepper, superior to that of any other foreign port. It is impossible to state the number of plants which cover the hills (of Hsia-li). It is a creeper which grows like a wistaria vine, and which blooms in winter and bears fruit in summer. The people gather it and dry it in the sun to remove its pungent flavour. The pepper gatherers for the most part do not mind its flavour, but if they do, they get relief by using a decoction of C*h'uan-hsiung.* The pepper of all other foreign parts is all the surplus product of this county.

9. The Loahc tree, Odoric of Pordenone[55]

In this country there are trees which give wine which they call *loahc* and which is very intoxicating.

10. Pepper in Malabar, Odoric of Pordenone[56]

And now that ye may know how pepper is got, let me tell you that it groweth in a certain empire whereunto I came to land, the name whereof is Minibar [Malabar], and it groweth nowhere else in the world but there. And the forest in which the pepper groweth extendeth for a good eighteen days' journey, and in that forest there be two cities, the one where of is called Flandrina [Bandiranah, sixteen miles north of Calicut] and the other Cyngilin [Shinkali, port next below to Calicut]…

Now, in this country they get the pepper in this manner. First, then, it groweth on plants which have leaves like ivy, and these are planted against tall trees as our vines are here, and bear fruit just like bunches of grapes; and this fruit is borne in such quantities that they seem like to break under it. And when the fruit is ripe it is of a green colour, and 'tis gathered just as grapes are gathered at the vintage, and then put in the sun to dry. And when it is dried it is stored in jars [and of the fresh pepper also they make a confection, of which I had to eat and plenty of it]…At the extremity of that forest, towards the south, there is a certain city which is called Polumbum, in which is grown better ginger than anywhere else in the world. And the variety and abundance of wares for sale in that city is so great that it would seem past belief to many folk.

11. Ginger at Pacamuria and Helly, Nicolo Conti[57]

Proceeding onwards he sailed [from Cambay] for the space of twenty days, and arrived at two cities situated on the sea shore, one named Pacamuria, and the other Helly. In these districts grows ginger, called in the language of the country *beledi, gebeli,* and *neli.* It is the root of a shrub, which grows to the height of two cubits, with great leaves, similar to those of the blue lilies called *Iris,* with a hard bark. They grow like the roots of reeds, which cover the fruit. From these the ginger is obtained, on which they cast ashes and place it in the sun for three days, in which time it is dried.

12. The palm tree at Cahila, Nicolo Conti[58]

Beyond this city [of Mylapore] there is another, which is called Cahila, where pearls are found. Here also there grows a tree which does not bear fruit, but the leaf of which is six cubits in length and almost as many broad, and so thin that when pressed together it can be held in the closed hand [the palmyra tree]. These leaves are used in this country for writing upon instead

of paper, and in rainy weather are carried on the head as a covering to keep off the wet. Three or four persons travelling together can be covered by one of these leaves stretched out.

13. The jack tree in Malabar, Nicolo Conti[59]

A tree grows here in great abundance, the trunk of which produces fruit resembling the pineapple, but so large as to be lifted with difficulty by one man; the rind is green and hard, but yields nevertheless to the pressure of the finger. Within are from two hundred and fifty to three hundred apples, resembling figs, very sweet to the taste, and which are separated from each other by follicles. They have a kernel within, resembling the chesnut in hardness and flavour, flatulent, and which is cooked in the same manner as the chesnut; when thrown upon live embers, unless previously incised somewhat, it bounces up with a crackling noise. The external bark is used as provender for cattle [the jack tree]. The fruit of this tree is sometimes found under the earth in its roots; these excel the others in flavour; and for this reason it is the custom to set these apart for royal use. This fruit has no kernel. The tree is like a large fig tree, the leaves being in-tercised like those of the palm: the wood is equal to box-wood, and is therefore much prized for its applicability to many purposes. The name of this tree is *cachi.*

There is also another fruit, called *amba* [mango], green and resembling very much a nut, but larger than the nectarine; the outer rind is bitter, but within it is sweet like honey: before they are ripe they steep them in water to remove the acidity, in the same manner as we are in the habit of steeping green olives.

14. Ku-li, Calicut, Ma Huan[60]

To return to Calicut, much pepper is grown on the hills. Cocoanuts are extensively cultivated, many farmers owning a thousand trees; those having a plantation of three thousand are looked upon as wealthy proprietors…The jackfruit and the plantain abound in this country, which is also well supplied with melons, gourds, and turnips, and every other kind of vegetable.

15. Spices at Calicut, Hieronimo di Santo Stefano[61]

We found that pepper and ginger grew here. The pepper trees are similar to the ivy, because they grow round other trees wherever they can attach themselves; their leaves resemble those of the ivy. Their bunches are of the length of half a palm or more, and as slender as a finger: the grain grows

very thickly around. The reason why pepper does not grow in our region is, that we have none of the trees to plant. It is not true, as reported amongst us, that the pepper is scorched in order that it may not grow. When it is ripe and gathered in it is green, like ivy; it is left to dry in the sun, and in five or six days it becomes black and wrinkled as we see it. For the propagation of ginger they plant a piece of a small fresh root, about the size of a small nut, which at the end of a month grows large: the leaf resembles that of the wild lily.

FAUNA

1. Sperm whale in Indian Ocean, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[62]

In this [sea] is found a fish that appears occasionally. It has herbs and shells growing on its back. The captains of boats, sometimes, lay anchor against it thinking it to be an island, but when they realize their mistake they set sail from it. Sometimes, when this fish spreads out one of its two wings on its back, it appears like the sail of a ship. When it raises its head above water, you can see it as an enormous object. Sometimes it blows out water from its 'mouth', which resembles a lofty tower. Whenever the sea is calm and the fishes gather together, it collects them round with the help of its tail. Then it opens its mouth and the fishes dive into its belly as if diving into a well. The boats sailing on this sea are scared of it, so during the nightfall they blow the trumpets resembling those of the Christians, for they are afraid that it might lean heavily against their boat and cause it to be drowned.

This sea has a fish that we have caught. It is twenty cubits long. Then we opened up its stomach and took out from inside another fish belonging to the same species; and when we opened up the stomach of this second one, we again found a similar [fish] inside it. Each one of these was alive and wriggling and resembled one another in shape. This huge fish called *al-wal,* even though it has an enormous constitution, has an [enemy] fish called *al-Lashk,* which is about a cubit long. Thus, whenever this fish *(al-wal)* becomes violent and oppressive and starts doing harm to the other fishes of the sea, this small fish sets against it and, sticking itself at the root of its gill (lit. ear), does not leave it till it has killed it. It [small fish] usually clings to

the boat, so this large fish does not come near the boat to avoid the small one.

There is another fish in this sea whose face, it is related, resembles that of a human being. It flies above water. This fish is called *al-mij*. There is another fish that lies in wait for it under water, and as soon as it drops this fish swallows it. It is called *alanqatus*. All the fishes eat up each other.

2. Rhinoceros, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[63]

In his country is also found the marked *al-bishan* [Sanskrit visana, a horn] and that is *al-karkaddan* [Sanskrit khadgadanta, rhinoceros]. It has a single horn on the front side of its forehead, and inside the horn one finds the impression of the image of a creature, for example, the image resembling a human being. The horn is all black and the image inside it is white. In stature this rhinoceros is smaller than the elephant and tends to be black in colour. It resembles the buffalo and is strong; no animal commands the same strength as he does. It has no joints in its knees nor in its forelegs. From its legs up to its armpit it is one [solid] piece, and the elephant runs away from it. It ruminates like the oxen and the camels, and its meat is allowed [to be eaten], and we have eaten it. It is found in large numbers in the forests of this kingdom, and is found all over India except that the horns of this [particular type] are excellent. Sometimes one finds inside the horn the image of a man, a peacock, a fish or other images. The Chinese manufacture girdles out of it. The price of a single girdle in China goes up to two thousand, three thousand or even more *dinars* depending upon the beauty of the picture. All this is purchased in the kingdom of Dharma with cowry which is the money of this kingdom.

3. A rare animal, Muhammad U'fi[64]

Abu Rihan mentions in his writings that within the boundaries of Hindustan, to the east of the Ganges, in the forests of Oudh, there exists an animal called Sharu. It is larger than a rhinoceros, and has two long horns and a small trunk. On the back it has four protuberances resembling four feet. It is so powerful that it will attack an elephant and tear him asunder. No animal has strength enough to contend against it, nor does man venture to hunt it, in fact nothing has power over it except death. Besides natural death, one cause of its destruction is that it often takes up an animal on its

horns and tosses it in the air. The flesh adhering to the horns creates worms, which falling on its back, eat into the flesh till it becomes very sore; they then attack its stomach and destroy it. Or, if there be a high mountain near, when it thunders, it will rush as if to attack (some unseen foe) and falling from the mountain destroy itself. People go out to pick up its horns. Its specific peculiarities (*khassiyat*) are not known.

This animal resembles a camel. It has two protuberances on the back and it generally has teeth, the limbs and organs of the body are venomous, and no other animal can escape it. Its spittle, dung, etc., are all deadly poison. Whatever meets its eye becomes its prey, for it runs as swift as the wind, and overtakes all creatures. It kills every animal that it may encounter. If anyone takes refuge from it in the top of a high tree which it cannot get up, it stands at the foot, and curling its tail into a sort of ladle, it tosses its water up – this in a very few moments brings its victim down. If any one to avoid it gets into a well, it will stand at the brink and cast its dung and urine down, and if one drop of this falls upon a man he will die.

4. Horses imported, Shihabuddin al Umari[65]

Camels are few; they are only for the Sultan and for those from among the Khans, Amirs, Wazirs and high office-bearers who are with him.

Horses are numerous, there are two kinds: Arabian and pack horses, and mostly their work is not worth the praise. Therefore, they are imported to India from the neighbouring countries of the Turks. Arabian horses are brought from Bahrain, Yemen and Iraq in spite of the fact that in the interior of India there are Arabian horses of noble descent: which are cheap in price, but they are only few in number. When the horses stay in India for a long time, their legs become weak.

As regards the mules and donkeys, it is according to their opinion, a great disgrace and a shame to ride them. No jurist or man of letters will think it proper to ride a mule. As regards the donkey, it is a great insult and disgrace to ride it according to them, but everyone rides the horse. The loads of the noblemen are carried on horses, and common people carry them on oxen. They are quick-footed and go with long strides.

5. Trained elephants in India the Greater, Friar Jordanus[66]

These animals [elephants] are marvellous; for they exceed in size and bulk and strength, and also in understanding, all the animals of the world. This

animal hath a big head; small eyes, smaller than a horse's; ears like the wings of owls or bats; a nose reaching quite to the ground extending right down from the top of his head; and two tusks standing out of remarkable magnitude (both in) bulk and length, which are (in fact) teeth rooted in the upper jaw. This animal doth everything by word of command; so that his driver hath nothing to do but say once, 'Do this,' and he doeth it; nor doth he seem in other respects a brute, but rather a rational creature. They have very big feet, with six hoofs like those of an ox, or rather of a camel. This animal carrieth easily upon him, with a certain structure of timber, more than thirty men; and he is a most gentle beast, and trained for war, so that a single animal counteth by himself equal in war to 1,500 men and more; for they bind to his tusks blades or maces of iron wherewith he smiteth. Most horrible are the powers of this beast, and specially in war.

Two things there be which cannot be withstood by arms; one is the bolt of heaven; the second is a stone from an artillery engine; this is a third! For there is nothing that either can or dare stand against the assault of an elephant in any manner. A marvelous thing! He kneeleth, lieth, sitteth, goeth, and cometh, merely at his master's word. In short, it is impossible to write in words the peculiarities of this animal.

6. The elephants of Hindustan, Timur[67]

It had been constantly dinned into the ears of my soldiers that the chief reliance of the armies of Hindustan was on their mighty elephants; that these animals, in complete armour marched into battle in front of their forces, and that arrows and swords were of no use against them; that in height and bulk they were like small mountains, and their strength was such that at a given signal they could tear up great trees and knock down strongly built walls; that in the battle-field they could take up the horse and his rider with their trunks and hurl them into the air. Some of the soldiers, in the doubt natural to man, brought some little of what they had heard to my attention, so when I assigned their respective positions to the princes and *amirs* of the right and left wing and of the centre, I enquired of the learned and good men that accompanied my army, such as…where they would like to be placed in the day of battle. They had been with me in many campaigns and had witnessed many a great battle, but the stories about the elephants of India had so affected them that they instantly replied that they would like to

be placed with the ladies while the battle was in progress. So to allay the apprehensions of this class of men I gave orders that all the buffalos which had been taken and placed with the baggage should be brought up; I then had their heads and necks fastened to their legs, and placed the animals inside the *abattis*.

7. Elephants of the Delhi Sultan, Timur[68]

I sent a party of men into the city to bring out the elephants which Sultan Mahmud had abandoned when he fled. They found 120 enormous elephants and several rhinoceroses, which they brought out to my Court. As the elephants passed by me I was greatly amused to see the tricks which their drivers had taught them. Every elephant, at the sign of the driver, bowed his head to the ground, made his obeisance, and uttered a cry. At the direction of their drivers they picked up any object from the ground with their trunks and placed it in their driver's hands, or put it into their mouths and kept it. When I saw these mighty animals, so well trained and so obedient to weak man, I was greatly astonished, and I ordered that they should be sent to Turan and Iran, to Fars, and Azur, and Rum, so that the princes and nobles throughout my dominions might see these animals. Accordingly I sent five to Samarkand, two to Tabriz, one to Shiraz, five to Hirat, one to Sharwan, and one to Azurbaijan.

8. "A very intelligent animal," Gonzalez de Clavijo, emissary of Enrique III of Castile to Tamerlane from 1403-1406[69]

The elephant is a very intelligent animal and obeys readily what his guide wishes him to do. The man who guides him, sits on his neck, with his legs across the beast's ears. He carries a goad in his hand, with which he scratches its head, and makes it go where he wishes, for when he makes a sign with the goad, it goes in the direction pointed out. When it fights, the guide is armed, as well as the elephant. It walks like a bear, it jumps, and at each jump, it wounds with swords fastened to the trunk. When they wish these elephants to fight, the guides hit them on the forehead with the goad, and make great wounds; and when they feel the wounds, they give loud grunts, like pigs, and with open mouth, rush on in the direction pointed out by the guide. The wounds heal in the night, if they leave the beasts in the open air, but if they are put under a roof, they will die. When the guide orders the elephant to take anything off the ground, however heavy it may

be, it raises it with its trunk and gives it to the men who are in the castle on its back; and when those in the castle want to come down, they order it to stoop, and it stretches out its fore and hind legs in opposite directions, and touches the ground with its belly, while the men descend by cords which hang from the castle…

I hold it to be true, from what I…saw; that one elephant is worth a thousand men in a battle; for when they are amongst men, they rush about wounding everyone; and when they are themselves wounded, they become more fierce, rush about more wildly, and fight better. As the tusks are too high up for them to wound with them, they fasten swords to them, so that they may wound the people under them. They go a day or two without eating, and they are even able to go three days without food.

9. Royal elephants at Vijayanagar, Abder Razzak[70]

Although the king possesses a considerable number of elephants in his dominions, the largest of these animals are kept near the palace, in the interior of the first and second fortress, between the north and the west. These elephants copulate, and bring forth young. The king possesses one white elephant of an extremely great size, on whose body are scattered here and there grey spots like freckles. Every morning this animal is led out before the monarch, and the sight of him seems to act as a happy omen. The elephants of the palace are fed upon *kitchri*. This substance is cooked, and it is taken out of the copper in the elephant's presence; salt is thrown on it, and fresh sugar is sprinkled over it, and the whole is then mixed well together. They then make balls of it, weighing about two *man,* and, after steeping them in butter, they put them into the elephant's mouth. If one of these ingredients has been forgotten, the elephant attacks his keeper, and the king punishes this negligence severely. These animals take this food twice a day.

Each elephant has a separate compartment, the walls of which are extremely solid, and the roof composed of strong pieces of wood. The neck and the back of these animals are bound with chains, the end of which is strongly fastened to the top of the roof. If they were fixed otherwise, the elephant would easily undo them: the fore feet also are held by chains.

10. Mode of catching elephants, Abder Razzak[71]

The mode of catching the elephant is as follows. On the road which the animal takes when he goes to drink, they dig a trench, and cover the mouth of it over, but very lightly. When an elephant falls into it, two or three days are allowed to elapse before anyone goes near him. At the end of that time a man comes and strikes the animal with several blows of a stick well applied: upon this another man shows himself, and violently drives away the man who struck the blows, and, seizing his stick, hurls it a great way off; after which he throws some food to the elephant, and goes away. For several days the first of these men comes to beat the elephant, and the second prevents him from continuing to do so. Before long the animal becomes very friendly with this latter individual, who by degrees, approaches the elephant, and offers him fruits, for which this animal is known to have a liking. He then scratches him and rubs him, and the elephant, won over by this maneuver, submits without resistance, and allows a chain to be passed round his neck.

Elephant hunting by kings

Even the sovereigns of Hindoostan take part in hunting the elephant. They remain a whole month, or even more, in the desert or in the jungles, and when they have taken any of these animals, they are very proud of it. Sometimes they cause criminals to be cast under the feet of an elephant that the animal may crush them to pieces with his knees, his trunk, and his tusks. The merchants who trade in elephants go to seek them in the island of Ceylon, and export them to different countries, where they sell them according to the tariff, which varies by the *ghez.*

11. Serpents in Malabar, Nicolo Conti[72]

There are also serpents without feet, six ells in length, wild, but harmless unless irritated [pythons]. They are pleased with the sight of little children, and by this means are enticed into the presence of men. In the same province, and also in another called Susinaria, there is found another kind of serpent with four feet, and an oblong tail like that of large dogs, which are hunted for food. It is as harmless as kids or goats, and the flesh is prized as the best kind of food.

This region also produces other serpents of a remarkable form, one cubit in length and winged like bats. They have seven heads arranged along the body, and live in trees. They are extremely rapid in flight, and the most

venomous of all, destroying men by their breath alone. There are also flying cats, for they have a pellicle extending from the fore to the hinder feet and attached to the body, which is drawn up when they are at rest. They fly from tree to tree by extending their feet and shaking their wings. When pursued by hunters they fall to the earth when fatigued by flying, and so are taken.

12. Wildlife in Aland, Athanasius Nikitin[73]

In that Aland (Aladinand?) there is a bird, *gookook,* that flies at night and cries 'gookook,' and any roof it lights upon, there the man will die; and whoever attempts to kill it, will see fire flashing from its beak. Wild cats rove at night and catch fowls; they live in the hills and among stones. As to monkeys, they live in the woods and have their monkey *kniaz,* who is attended by a host of armed followers. When any of them is caught they complain to their *kniaz*, and an army is sent after the missing; and when they come to a town they pull down the houses and beat the people; and their armies, it is said, are many. They speak their own tongues and bring forth a great many children; and, when a child is unlike its father or its mother, it is thrown out on the high road. Thus they are often caught by the Hindoos, who teach them every sort of handicraft, or sell them at night, that they may not find their way home, or teach them dancing.

13. Birds in India the Less, Friar Jordanus[74]

As for birds I say plainly that they are of quite different kinds from what are found on this side of the world; except, indeed, crows and sparrows; for there be parrots and popinjays in very great numbers, so that a thousand or more may be seen in a flock. These birds, when tamed and kept in cages, speak so that you would take them for rational beings. There be also bats really and truly as big as kites. These birds fly nowhither by day, but only when the sun sets. Wonderful! By day they hang themselves up on trees by the feet, with their bodies downwards, and in the day time they look just like big fruit on the tree.

There are also other birds, such as peacocks, quails, Indian fowls, and others, divers in kind; some white as white can be, some green as green can be, some parti-coloured, of such beauty as is past telling.

14. Birds in India the Greater, Friar Jordanus[75]

Of birds I say this: that there be many different from those of Lesser India, and of different colours; for there be some white all over as snow; some red

as scarlet of the grain; some green as grass; some parti-coloured; in such quantity and delectability as cannot be uttered. Parrots also, or popinjays, after their kind, of every possible colour except black, for black ones are never found; but white all over, and green, and red, and also of mixed colours. The birds of this India seem really like creatures of Paradise...

There is also in this India a certain bird, big like a kite, having a white head and belly, but all red above, which boldly snatches fish out of the hands of fishermen and other people, and indeed (these birds) go on just like dogs.

There is also another big bird, not like a kite, which flies only at night, and utters a voice in the night season like the voice of a man wailing from the deep.

What shall I say then? Even the Devil too there speaketh to men, many a time and oft, in the night season, as I have heard [a reference to the night-hawk].

Everything indeed is a marvel in this India! Verily it is quite another world!

15. Talking parrots, Timur[76]

Bahadur Nahir [from the city of Kutila] sent to me as a tribute two white parrots which could talk well and pleasantly. The envoys presented them to me, and told me that these two parrots had belonged to Sultan Tughlik Shah, and that they had lived at the courts of the Sultans ever since. The sight of these parrots and the sound of their voices gave me great satisfaction, so I gave directions that they should be brought before me in their cages every day that I might listen to their talk.

16. A unique bird, Nicolo Conti[77]

He says that on the boundaries of central India there is an unique bird called semenda, in. the beak of which there are, as it were, several distinct pipes with many openings. When death approaches, this bird collects a quantity of dry wood in its nest, and, sitting upon it, sings so sweetly with all its pipes that it attracts and soothes the hearers to a marvellous degree; then igniting the wood by flapping its wings, it allows itself to be burnt to death. In a short time a worm is produced from the ashes and from this worm the same kind of bird is again produced. The inhabitants have made a pipe of admirable sweetness for singing, in imitation of the bill of this bird.

17. Insects in India the Greater, Friar Jordanus[78]

There is there also a certain kind of wasps, which make it their business to kill very big spiders whenever they find them, and after-wards to bury them in the sand, in a deep hole which they make, and so to cover them up that there is no man in the world who can turn them up, or find the place.

There is also a kind of very small ants, white as wool, which have such hard teeth that they gnaw through even timbers and the joints of stones, and, in short whatever dry thing they find on the face of the earth, and mutilate woollen and cotton clothes. And they build out of the finest sand a crust like a wall, so that the sun cannot reach them, and so they remain covered. But if that crust happens to get broken, so that the sun reaches them, they incontinently die.

As regards insects, there be wonders, so many, great, and marvelous, that cannot be told.

D. Precious Stones and Metals

1. Stones like cat's eyes in Malabar, Chau Ju-Kua[79]

There is in this country a river of brackish water, which, at a certain point where its different channels meet, becomes very broad. At this point its banks are bold cliffs in the face of which sparks (lit., stars) can constantly be seen, and these by their vital powers fructify and produce small stones like cat's-eyes, clear and translucid.

They lie buried in holes in (these) hills until some day they are washed out by the rush of a flood, when the officials send men in little boats to pick them up. They are prized by the natives.

2. Precious stones in India the Less, Friar Jordanus[80]

In this India are many and divers precious stones, among which are the best diamonds under heaven. These stones never can be dressed or shaped by any art, except what nature has given. But I omit the properties of these stones, not to be prolix. In this India are many other precious stones, endowed with excellent virtues, which may be gathered by anybody; nor is anyone hindered.

3. Metals in India the Less, Friar Jordanus[81]

In this India there exist not, nor is found, any metal but what comes from abroad, except gold, iron, and electrum.

4. Pearls in India the Greater, Friar Jordanus[82]

Between that island [Ceylon] and the main are taken pearls or marquerites, in such quantity as to be quite wonderful. So indeed that there are sometimes more than 8,000 boats or vessels, for three months continuously, (engaged in this fishery). It is astounding, and almost incredible, to those who have not seen it, how many are taken.

5. Precious stones at Cambay, Nicolo Conti[83]

Sailing in this wise together, he arrived in the course of a month at the very noble city of Cambay, situated in the second gulf [Gulf of Cambay] after having passed the mouth of the river Indus. In this country are found those precious stones called sardonixes.

6. Diamond mines, Nicolo Conti[84]

At fifteen days' journey beyond Bizenegalia, towards the north, there is a mountain called Albenigaras, surrounded by pools of water which swarm with venomous animals, and the mountain itself is infested with serpents. This mountain produces diamonds. The ingenuity of man, not having been able to find any mode of approaching the mountain, has, however, discovered a way of getting at the diamonds produced on it. There is another mountain near it, a little higher. Here, at a certain period of the year, men bring oxen, which they drive to the top, and having cut them into pieces, cast the warm and bleeding fragments upon the summit of the other mountain, by means of machines which they construct for that purpose. The diamonds stick to these pieces of flesh. Then come vultures and. Eagles flying to the spot, which, seizing the meat for their food, fly away with it to places where they may be safe from the serpents. To these places the men afterwards come, and collect the diamonds which have fallen from the flesh.

Other stones, which are considered precious, are procured with less difficulty. They dig holes near sandy mountains in places where the stones are found, and continue their excavations until they come to sand mixed with water. This sand they collect and wash with water, through sieves made for the purpose. The sand passes away through the sieve, and the stones, if any, are left behind: this mode of digging for stones of this description prevails universally. Great care is exercised by the masters to prevent theft by the workmen or servants, – overseers being appointed, who

not only shake the clothes of the operators, but even examine every part of their persons.

End-notes

1. Kia Tan [730-805], the great geographer of the Tang period, on the sea route to India, Hirth and Rockhill, p., 101

From Annam there exists (land) communication with Tien-chu (India), but as Ta-mo (Dharma, the first Buddhist patriarch in China) came by sail all the way to P'an-yu (Canton), we may draw the conclusion that this sea-route is the more practicable one to follow.

2. The *Primera cronica general* [a project of King Alfonso X (1252-1284) of Spain], refers to India as a symbol for the outer limits of the known world, Bryant p., 38

[In the list of peoples who aided Pompey in his struggle with Julius Caesar, are included] those from the farthest confines of the Orient, those from the banks of the river Ganges, those from the river Yndo, who are from the Indias, those from the river Ydaspe which enters into the Yndo,…and other peoples from other lands beyond which history does not name…[In another place, it states that the conquests of the Emperor Trajan extended beyond the Tigris and Euphrates, and he] came to even the ends of India, where no conquerer had ever reached, unless it was the great Alexander.

3. The work *Ling-wai-tai-ta* on India, Hirth and Rockhill, p., 101

Among the hundreds of countries in the West that are famous, the one which ranks the highest of all is Wang-sho-ch'ong, the Mid-India (Yin-tu) of the Tien-chu country, which owes its great fame to being the birthplace of the Buddha.

Tradition says that to the east of this country is the Hei-shui river or 'Black water-muddy river' [Irrawadi?] and a Sea. Still farther east beyond this are the Western Regions (Turkestan), the T'u-fan (the Tibetans), Ta-li (Yu-nan) and Kiau-chi (Tongking). To the west of this country is the Eastern Ocean of the Ta-shi (Arabs), and still farther west than this are the realms of the Ta-shi. To the south of (Mid-India) is an island called the kingdom of Si-lan (Ceylon), and its sea is called the Sea of Si-lan.

In olden times the envoy Chang K'ien being in Ta-hia (Bactria) learnt that the land of Shou-tu (India) was 1000 *li* south-east of Tahia. He also learnt that the kingdom of Ta-li (S.W. Yu-nan) was not more than forty stages from Wang-sho ch'ong (Mid-India).

4. Even travellers who took the land route across Asia from China to the West were interested in India; Friar William of Rubruck on his conversation with envoys of an Indian ruler who had brought presents for the Mongol ruler, Mangu Khan in A.D. 1254, Rockhill, p, 248

With the feast of Pentecost (31st May [1254]) they began preparing the letter which he (the Chan) was to send you. In the meanwhile he came back to Caracarum, and held his great ceremony on the octave of Pentecost (7th June), and he wanted all the ambassadors to be present the last day of it. He sent also for me…I saw also the envoy of a certain Soldan of India, who had brought eight leopards and ten greyhounds taught to sit on horses' backs, as leopards sit. When I asked them concerning India, in what direction it was from that place, they pointed to the west. And these envoys went back with me for nearly three weeks, always going westward.

CHAPTER — 2

Social Life, Customs and Manners

A. Some Descriptions of the People
B. Cleanliness, Dress and Appearance
C. Diet
D. Dwellings
E. Glimpses of People in Some Regions
F. Festivals
G. Funeral Rites

A. Some Descriptions of the People

1. Distinctive traits, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[1]

Sometimes they (Indians) fight each other over sovereignty, but this is rare: I have not seen anyone ousting another person from his kingdom except the people who are next to the land of pepper. Whenever a king subjugates a kingdom, he entrusts the kingdom to a person belonging to the family of the defeated king, who remains under his authority. The people of the kingdom do not accept any other arrangement except this…Neither the Indians nor the Chinese get circumcised.

2. Comparison of India and China, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[2]

The Chinese have no science *('ilm)*. Their religion originated in India; they assert that it were the Indians who procured their idols for them, and that they are the people who possess religion. The inhabitants of both the countries believe in metempsychosis, but they differ in the details *(furu, lit.* consequences) of their religious practices. The Indians have medicine and philosophy. The Chinese also have medicine, but their medical science is mostly cauterisation. They have knowledge of astronomy, but in India it is more popular.

3. Abstemious by temperament, Sulaiman [3]

The Chinese are men of pleasure; but the Indians condemn pleasure, and abstain from it. They do not take wine, nor do they take vinegar, which is

made of wine. This does not arise from religious scruples, but from their disdain of it. They say, "The prince who drinks wine is no true king." The Indians are surrounded by enemies, who war against them, and they say "How can a man who inebriates himself conduct the business of a kingdom?"

Not warlike

The Indians sometimes go to war for conquest, but the occasions are rare. I have never seen the people of one country submit to the authority of another, except in the case of that country which comes next to the country of pepper [Malabar]. When a king subdues a neighboring state, he places over it a man belonging to the family of the fallen prince, who carries on the government in the name of the conqueror. The inhabitants would not suffer it to be otherwise.

4. 'Highly meritorious,' Jahiz of Basra[4]

The inhabitants of India are highly meritorious in astrology and medicine. They have a peculiar script. In medicine too they have a supreme insight. They have in their possession some strange secrets of the art of Aesculapius. They have medicines for some very fell diseases. In making busts and statues, in making pictures out of colours, and in architecture they are superb. They are the inventors of chess which is a game of mental gymnastics. They make fine swords and know how to wield them. They know incantations to annihilate the effects of poisoning and to cure aches. Their music is also enchanting. One of their musical instruments is known as *Kanka* (?) which is played on by striking a chord strung in a gourd. It sounds like the guitar and the conch shell…there is every variety of dance, and they have got different kinds of script. There is an uncommon fund of poetical wealth and oratorical affluence in their possession. They know the arts of medicine, philosophy and ethics. The book *Kalah wa Dimna,* has come to us from them. They have plenty of courage and common-sense and many qualities which are wanting even in the Chinese. Cleanliness is a noted feature. They have good looks, tall stature and a taste for perfumes. It is from their land that the peerless ambergris comes for the use of kings. Streams of high thinking flowed down from India to Arabia… They are the inventors of astronomical calculations. Their women are expert singers and their men are expert cooks. Dealers in monetary transactions do not entrust

their purses to any except them. The treasurer of every such dealer in Iraq must be a Sindhi or a son of a Sindhi. Their natural bias is towards figuring, monetary transactions and things like these. They make very honest and faithful servants.

5. Practice telepathy, Ibn Khurdadhbih[5]

The Indians claim that they can achieve their objectives with the help of magic. With its help they can cure poison and remove it from anyone who has been poisoned. They also practise telepathy and with its help they cause things to happen or prevent them from taking place and also cause harm or benefit. Again, they produce phantoms to the bewilderment of the sage. Then they claim that they can control the rains and cold.

6. Kings tolerant, Buzurg bin Shahriyar[6]

The Indian Rajahs are particularly well-disposed towards the Muslims.

7. Men of wisdom, Yaqubi[7]

The Indians are men of wisdom and vision, and in wisdom are superior to all other nations. Their views on astronomy are most authentic. Their dictums in medicine are preferable.

8. Nothing indecent to be seen, Abu Zaidu-l Hasan, of Sira[8]

There is no kingdom which has a more dense population than Kumar. Here every one walks on foot. The inhabitants abstain from licentiousness, and from all sorts of wine. Nothing indecent is to be seen in this country.

9. Endowed with sagacity, Al Masudi[9]

A group of the people of insight and investigation, who have devoted their attention to and contemplated over the nature and origin of this world, have stated that in the ancient times the Indians were the people endowed with righteousness and sagacity…

10. Distinct from all other black people, Al Masudi[10]

There prevails a great difference of language and religion in these kingdoms, and they are frequently at war with each other. The most of them believe in the metempsychosis, or the transmigration of the soul. The Hindus are distinct from all other black people, as the Zanjis, the Damadams, and others, in point of intellect, government, philosophy, strength of constitution, and purity of colour.

Abstain from drinking wine

The Hindus abstain from drinking wine, and censure those who consume it; not because their religion forbids it, but in the dread of its clouding their reason and depriving them of its powers. If it can be proved of one of their king's, that he has drunk (wine), he forfeits the crown; for he is (not considered to be) able to rule and govern (the empire) if his mind is affected.

11. An anonymous late 10th century Persian text, *Hudud al-alam* [The Limits of the World] has this section on Hindustan[11]

[Hindustan] possesses many amenities, a numerous population, and many kings…all through Hindustan, wine is held to be unlawful and adultery to be licit.…all the inhabitants are idolaters…[the] numerous idols of gold and silver [are tended by Brahmins; *zahidan wa brahmanan*]…whenever one of the chiefs dies, all the inferiors living under his shadow kill themselves.

12. Al- Bakri, the Arab author, on the similarity of customs in Russia and India[12]

They [the Russians] have customs like those of the Indians.

13. Land known for the wisdom of its people, Arab scholar, Sa'id ibn Ahmad al-Andalusi, in his *Tabaqat al-umam*, among the earliest books on the history of science[13]

The first nation to have cultivated science is India…India is known for the wisdom of its people. Over many centuries, all the kings of the past have recognised the ability of the Indians in all the branches of knowledge…The Indians, known to all nations for many centuries, are the metal [essence] of wisdom, the source of fairness and objectivity. They are people of sublime pensiveness, universal apologues, and useful and rare inventions...To their credit the Indians have made great strides in the study of numbers and of geometry. They have acquired immense information and reached the zenith in their knowledge of the movements of stars [astronomy]…After all that they have surpassed all other peoples in their knowledge of medical sciences.

14. Hindus entirely different from Muslims, Alberuni[14]

For the reader must always bear in mind that the Hindus entirely differ from us in every respect, many a subject appearing intricate and obscure

which would be perfectly clear if there were more connection between us. The barriers which separate Muslims and Hindus rest on different causes...

Differences in manners and customs

…in all manners and usages they differ from us to such a degree as to frighten their children with us, with our dress, and our ways and customs, and as to declare us to be devil's breed, and our doings as the very opposite of all that is good and proper. By the by, we must confess, in order to be just, that a similar depreciation of foreigners not only prevails among us and the Hindus, but is common to all nations towards each other…

Another source of difference – self-conceit of Hindus

…there are other causes, the mentioning of which sounds like a satire – peculiarities of their national character, deeply rooted in them, but manifest to everybody. We can only say, folly is an illness for which there is no medicine, and the Hindus believe that there is no country but theirs, no nation like theirs, no kings like theirs, no religion like theirs, no science like theirs. They are haughty, foolishly vain, self-conceited, and stolid. They are by nature niggardly in communi-cating that which they know, and they take the greatest possible care to withhold it from men of another caste among their own people, still much more, of course, from any foreigner. According to their belief, there is no other country on earth but theirs, no other race of man but theirs, and no created beings besides them have any knowledge or science whatsoever. Their haughtiness is such that, if you tell them of any science or scholar in Khurasan and Persis, they will think you to be both an ignoramus and a liar. If they travelled and mixed with other nations, they would soon change their mind, for their ancestors were not as narrow-minded as the present generation is.

One of their scholars, Varahamihira, in a passage where he calls on the people to honour the Brahmans, says: "the Greeks, though impure, must be honoured, since they were trained in sciences, and therein excelled others. What, then, are we to say of a Brahman, if he combines with his purity the height of science?" In former times, the Hindus used to acknowledge that the progress of science due to the Greeks is much more important than that which is due to themselves. But from this passage of Varahamihira alone you see what a self-lauding man he is, whilst he gives himself airs as doing justice to others. At first I stood to their astronomers in the relation of a

pupil to his master, being a stranger among them and not acquainted with their peculiar national and traditional methods of science. On having made some progress, I began to show them the elements on which this science rests, to point out to them some rules of logical deduction and the scientific methods of all mathematics, and then they flocked together round me from all parts, wondering, and most eager to learn from me, asking me at the same time from what Hindu master I had learnt those things, whilst in reality I showed them what they were worth, and thought myself a great deal superior to them, disdaining to be put on a level with them. They almost thought me to be a sorcerer, and when speaking of me to their leading men in their native tongue, they spoke of me as the sea or as *the water which is so acid that vinegar in comparison* is *sweet*...

Similar attitude of ancient Greeks

The heathen Greeks, before the rise of Christianity, held much of the same opinions as the Hindus; their educated classes thought much the same as those of the Hindus; their common people held the same idolatrous views as those of the Hindus. Therefore I would like to confront the theories of the one nation with those of the other simply on account of their close relationship, not in order to correct them…

15. People skilful, Gardizi[15]

The people of India are skillful, clever, and shrewd. They make good and subtle things. From their midst come many sages, especially in the province (*vilayat*) of Kashmir. Their arts are very prodigious. In their religion there are differences, as well as in their customs. I have set forth here information about them such as I could find, in order that it should be known.

The Indians are very fastidious in maintaining (the rules of) relationship and will not take a wife from anywhere, or give a girl away unless the match suit their origin.…

Excel in singing and dancing

(They excel in) the art of singing and dancing and in the construction of implements of merriment: they operate *(bijunbanand)* some wonderful stringed instruments *(rud)* in a most difficult way while no other limb *(andam)* is moving (unnecessarily).

They have invented *(nihada-and)* manifold arms in great numbers (?) and they fabricate implements *(saz)* of war, such as horns *(buq)* and drums, as

well as contraptions producing fearful *(faji)* and terrifying sounds, such as the voice of the elephant or the roaring of the lion or of the tiger, so that he who hears then becomes terror-stricken and horror and dismay fill his heart.

And (they) also (make) stringed instruments for merriments and concerts.

The men producing such things are in the east of India (in the region) called KAMRUP. They make such things that whoever sees them or hears them admits that they are not human beings, but peris.

16. Love painting, Sharif al Idrisi of the royal family of Africa[16]

No other art is given preference over the art of drawing or making pictures. The art of pottery is placed on a par with it in being superior (to other arts).

17. Naturally inclined to justice, Sharif al Idrisi[17]

The Indians are naturally inclined to justice and never depart from it in their actions. Their good faith, honesty and fidelity to their engagements are well known, and they are so famous for these qualities that people flock to their country from every side; hence the country is flourishing and their condition prosperous. Among other characteristic marks of their love of truth and horror of vice, the following is related: When a man has a right to demand anything of another, and he happens to meet him has only to draw a circular line upon the ground and to make his debtor enter it which the latter never fails to do and the debtor cannot leave this circle without satisfying his creditor or obtaining the remission of the debt.

18. *Yin-du* famous for medicines, walnuts, precious stones, Chang Te[18]

The country of *Yin-du* (Hindustan) is the nearest to China. The population of it is estimated at twelve millions of families. There are in that country famous medicines, great walnuts, precious stones, *Ki she* (cloves), *pin t'ie* (fine steel) and other products. In this kingdom there are large bells suspended near the palace of the ruler. People who have to prefer a complaint strike against the bell. Then their names are registered and their cause is investigated. The houses are made of reeds. As it is very hot there in summer, people pass the whole time in water…diamonds came from *Yin-du*.

19. Sitting on ground honourable, Marco Polo[19]

Their mode of sitting is upon carpets on the ground; and when asked why they sit in that manner, they reply that a seat on the earth is honourable; that as we are sprung from the earth, so we shall again return to it; that none can do it sufficient honour, and much less should any despise the earth.

Unwarlike

The people go to battle with lances and shields, but without clothing, and are a despicable unwarlike race. They do not kill cattle nor any kind of animals for food, but when desirous of eating the flesh of sheep or other beasts, or of birds, they procure the Saracens, who are not under the influence of the same laws and customs, to perform the office.

No wine drinking

These people abstain from drinking wine made from grapes; and should a person be detected in the practice, so disreputable would it be held, that his evidence would not be received in court. A similar prejudice exists against persons frequenting the sea, who, they observe, can only be people of desperate fortunes, and whose testimony, as such, ought not to be admitted.

Boys start earning when thirteen

As soon as a son attains the age of thirteen years, they set him at liberty, and no longer suffer him to be an inmate in his father's house; giving him to the amount, in their money, of twenty to twenty-four groats. Thus provided, they consider him as capable of gaining his own livelihood, by engaging in some kind of trade and thence deriving a profit. These boys never cease to run about in all directions during the whole course of the day, buying an article in one place, and selling it in another. At the season when the pearl fishery is going on, they frequent the beach, and make purchases from the fishermen or others, of five, six, or more (small) pearls, according to their means, carrying them afterwards to the merchants, who, on account of the heat of the sun, remain sitting in their houses, and to whom they say: "These pearls have cost us so much; pray allow such a profit on them as you may judge reasonable." The merchants then give something beyond the price at which they had been obtained. In this way likewise they deal in many other articles, and become excellent and most acute traders. When business is over for the day, they carry to their mothers the provisions necessary for their dinners, which they prepare and dress for them; but these never eat anything at their fathers' expense.

Black colour sign of beauty

In this province the natives, although black, are not born of so deep a dye as they afterwards attain by artificial means, esteeming blackness the perfection of beauty. For this purpose, three times every day, they rub the children over with oil of sesame. The images of their deities they represent black, but the devil they paint white, and assert that all the demons are of that colour.

Addicted to divination

The people are gross idolaters, and much addicted to sorcery and divination. When they are about to make a purchase of goods, they immediately observe the shadow cast by their own bodies in the sunshine; and if the shadow be as large as it should be, they make the purchase that day. Moreover, when they are in any shop for the purpose of buying anything, if they see a tarantula, of which there are many there, they take notice from which side it comes, and regulate their business accordingly. Again, when they are going out of their houses, if they hear anyone sneeze, they return into the house, and stay at home. They are very abstemious in regard to eating, and live to an advanced age. Their teeth are preserved sound by the use of a certain vegetable which they are in the habit of masticating. It also promotes digestion, and conduces generally to the health of the body.

20. Men civil and friendly, John of Monte Corvino[20]

But India is a region of great extent, and it hath many realms and many languages. And the men thereof are civil and friendly enough, but of few words, and remind me somewhat of our peasants. They are not, strictly speaking, black, but of an olive colour, and exceedingly well formed both women and men. They go barefoot and naked, except that they wear a cloth round the loins, and boys and girls up to eight years of age wear nothing whatever, but go naked as they came from their mother's womb. They shave not the beard; many times a day they wash; bread and wine they have none. of the fruit that we make use of they have few or none; but for their daily food they use rice and a little milk; and they eat grossly like pigs, to wit, with the whole hand or fist, and without a spoon. In fact, when at their food they do look more like pigs than men.

21. Great security in the country, John of Monte Corvino[21]

There is great security in the country. Bandits and robbers are seldom met with; but they have many exactions to pay. There are few craftsmen, for craft and craftsmen have little remuneration, and there is little room for them. They commonly use swords and daggers like ourselves; and if actually they have a battle they make short work of it, however great the forces be, for they go to battle naked, with nothing but sword and dagger. They have among them a few Saracen mercenaries, who carry bows.

22. Rhabanus Maurus, abbot of Fulda and later Archbishop of Mainz, in his work *De Universo*[22]

[The Indian] …possesses the gold of wisdom and the silver of eloquence and the gems of all virtues in sufficient measure.

23. Have the greatest control over their passions, Shihabuddin al Umari[23]

Its people have wisdom and great intelligence. of all nations they have the greatest control over their passions and devote themselves most to what is regarded as bringing one near unto God….

The Indians are the most learned people in the branches of philosophy, medicine, arithmetic and (skilled) in all the wonderful crafts which it is impossible to imitate.

24. Most learned people, Subh-ul-A'sha[24]

The author of *Masalik ul Absar* [Ibn Fazullah ul-Umari]…continues, "Mohammad b. 'Abdur Rahim al-Qaist has described this country, in his book *Tuhfat ul-Albab* saying: huge country, great justice, considerable wealth, fine management, constant satisfaction, and security wherewith there is no fear in the country of India. The Indians are the most learned people in the branches of Philosophy, Medicine, Geometry and in all the wonderful arts."

25. A Spaniard, an anonymous Franciscan monk in his *Book of the knowledge of all the Kingdoms, Lands, and Lordships That Are in the World*[25]

They are men of clear understanding and good memories, learned in the sciences and live according to law. They say that the men who first heard of science and learning were these and that the Persians heard of these things from them…

26. Excel in riches, politeness, and magnificence, Nicolo Conti[26]

All India is divided into three parts: one, extending from Persia to the Indus; the second, comprising the district from the Indus to the Ganges; and the third, all that is beyond. This third part excels the others in riches, politeness, and magnificence, and is equal to our own country in the style in civilisation. For the inhabitants have most sumptuous buildings, elegant habitations, and handsome furniture; they lead a more refined life, removed from all barbarity and coarseness. The men are extremely humane, and the merchants very rich, so much so that some will carry on their business in forty of their own ships, each of which is valued at fifty thousand gold pieces. These alone use tables at their meals, in the manner of Europeans, with silver vessels upon them; whilst the inhabitants of the rest of India eat upon carpets spread upon the ground. There are no vines, nor is the use of wine known among the Indians; but they make a drink similar to wine of pounded rice mixed with water, the juice of certain trees, of a red colour, being added to it. In Taprobana they cut off the branches of a tree called *thal*, and hang them up on high: these branches give out a sweet juice, which is a favourite drink with them.

Holy lake

There is also a lake lying between the Indus and the Ganges, the water of which possesses a remarkable flavour and is drunk with great pleasure. All the inhabitants of that district, and even those living at a great distance, flock to this lake for the purpose of procuring the water. By means of relays of carriers mounted on horse-back, they draw the water fresh every day.

They have no corn or bread, but live upon a certain kind of meal, rice, flesh, milk, and cheese. They have a great quantity of poultry, capons, partridges, pheasants, and other wild birds. They are much addicted to fowling and hunting.

They have no beards, but very long hair. Some tie their hair at the back of their head with a silken cord, and let it flow over their shoulders, and in this way go to war. They have barbers like ourselves.

The men resemble Europeans in stature and the duration of their lives. They sleep upon silken mattresses, on beds ornamented with gold. The style of dress is different in different regions. Wool is very little used. There is great abundance of flax and silk, and of these they make their garments.

Almost all, both men and women, wear a linen cloth bound round the body, so as to cover the front of the person, and descending as low as the knees, and over this a garment of linen or silk, which, with the men, descends to just below the knees, and with the women to the ankles. They cannot wear more clothing on account of the great heat, and for the same reason they only wear sandals, with purple and golden ties, as we see in ancient statues. In some places the women have shoes made of thin leather, ornamented with gold and silk. By way of ornament they wear rings of gold on their arms and on their hands; also around their necks and legs, of the weight of three pounds, and studded with gems.

Public women are everywhere to be had, residing in particular houses of their own in all parts of the cities, who attract the men by sweet perfumes and ointments, by their blandishments, beauty, and youth; for the Indians are much addicted to licentiousness; but unnatural crimes are unknown among them.

The manner of adorning the head is various, but for the most part the head is covered with a cloth embroidered with gold, the hair being bound up with a silken cord. In some places they twist up the hair upon the top of the head, like a pyramid, sticking a golden bodkin in the centre, from which golden threads, with pieces of cloth of various colours interwoven with gold, hang suspended over the hair. Some wear false hair, of a black colour, for that is the colour held in highest estimation. Some cover the head with the leaves of trees painted, but none paint faces, with the exception of those who dwell near Cathay.

27. Pestilence unknown, Nicolo Conti[27]

Pestilence is unknown among the Indians; neither are they exposed to those diseases which carry off the population in our own countries: the consequence is that the number of these people and nations exceeds belief. They armies consist of a million of men and upwards.

28. Good at calculations, Ma Huan[28]

They have no abacus on which to make their calculations, but in its place they use their toes and fingers, and, what is very wonderful, they are never wrong in their reckonings.

29. Bow on meeting, Athanasius Nikitin[29]

On meeting together, they bow to each other like the monks, touching the ground with both hands, but say nothing.

B. Cleanliness, Dress and Appearance

1. Bathe frequently, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[30]

The Indians take a bath every day before having their meals. The Indians do not cohabit with the woman during the period of menstruation; they make them leave their homes and keep away from them [from their impurity]. [On the other hand] the Chinese cohabit with them during the period of menstruation and do not make them leave [their homes). The Indians clean their teeth and no one takes food before cleaning them or before having a bath, but the Chinese do not follow this practice.

2. At Kulin, anoint bodies with turmeric, Chau Ju-Kua[31]

Whenever they (i.e., the inhabitants) have taken a bath, they anoint their bodies with *yu-kin* (turmeric), as they like to have their bodies gilt like that of a Buddha.

3. Bathe twice a day, Marco Polo [32]

Both men and women wash their whole bodies in water twice every day, that is, in the morning and the evening. Until this ablution has taken place they neither eat nor drink; and the person who should neglect this observance, would be regarded as a heretic.

4. Bathe in cold water, Nicolo Conti[33]

Warm baths are not used amongst them, excepting by Indians of the superior classes to the north of the Ganges. The others wash themselves many times in the day with cold water.

DRESS AND APPEARANCE

1. Keep long beards, *Akhbar Al-Sin wa'l Hind,* An Account of China and India[34]

The Indians keep long beards. I have often seen a man with a beard as long as three cubits; they do not trim their moustache. Most of the Chinese have no beards which is natural to most of them. In India, when a person dies, they completely shave his head and beard.

2. Dress at Mansura and Multan, Abu Ishak al Istakhri[35]

The dress of the people is like that of the people of Irak, but the dress of their kings resembles that of the kings of India in respect of the hair and the tunic...

The people of Multan wear trousers, and most of them speak Persian and Sindi, as in Mansura.

3. Dress at Kulin, the *Ling-wai-tai-ta*[36]

The people of Ku-lin are black, they wrap their bodies in white cotton cloth, wear their beards and all their hair loose and uncovered. They wear red leather shoes, so they look when walking as if they had the painted feet of a *lo-han...* The king wraps his body in cotton-cloth, when he goes out he is carried in a litter *(juan-tou)* of cotton cloth, or else he rides on an elephant.

4. Dress at the court of T'ien-chu, Chau Ju-Kua[37]

The king dresses in brocaded silk, and his hair is wound into a spiral knot on the crown of his head; the rest of the hair is cut short. When holding his court in the morning he sits on a *tong* skin – *tong* being the name of an animal – ornamented with representations of various objects painted in red wax; and his courtiers make obeisance to him and pray for his life. When he goes forth he rides on horseback, and his saddle and bridle are thickly set with dark gold and silver. His followers, three hundred in number, are armed with spears and swords.

His consort wears a gold embroidered scarlet dress with large sleeves. Once a year she shows herself in public, when considerable bounty is given to the poor.

"In this country there is holy-water which can still the wind and waves. The foreign traders fill opaque glass bottles with it, and when they suddenly get in a rough sea they still it by sprinkling this water on it."

5. Dress of king of Maabar, Marco Polo [38]

The natives of this part of the country always go naked, excepting that they cover with a piece of cloth those parts of the body which modesty dictates. The king is no more clothed than the rest, except that he has a piece of richer cloth; but is honourably distinguished by various kinds of ornaments, such as a collar set with jewels, sapphires, emeralds, and rubies, of immense value. He also wears, suspended from the neck and reaching to

the breast, a fine silken string containing one hundred and four large and handsome pearls and rubies. The reason for this particular number is, that he is required by the rules of his religion to repeat a prayer or invocation so many times, daily, in honour of his gods, and this his ancestors never failed to perform. The daily prayer consists of these words, *pacauca, pacauca, pacauca* which they repeat one hundred and four [eight?] times. On each arm he wears three gold bracelets, adorned with pearls and jewels; on three different parts of the leg, golden bands ornamented in the same manner; and on the toes of his feet, as well as on his fingers, rings of inestimable value. To this king it is indeed a matter of facility to display such splendid regalia, as the precious stones and the pearls are all the produce of his own dominions.

6. Dress of people at Calicut, Abder Razzak[39]

The blacks of this country have the body nearly naked; they wear only bandages round the middle, called *lankoutah* [langot], which descend from the navel to above the knee. In one hand they hold an Indian poignard, which has the brilliance of a drop of water, and in the other a buckler of ox-hide, which might be taken for a piece of mist. This costume is common to the king and to the beggar.

As to the Mussulmauns, they dress themselves in magnificent apparel after the manner of the Arabs, and manifest luxury in every particular. After I had an opportunity of seeing a considerable number of Mussulmauns and Infidels, I had a comfortable lodging assigned to me, and after the lapse of three days was conducted to an audience with the king [the Zamorin]. I saw a man with his body naked, like the rest of the Hindus.

7. Dress at Junnar, Athanasius Nikitin[40]

In the land of India it is the custom for foreign traders to stop at inns; there the food is cooked for the guests by the landlady, who also makes the bed and sleeps with the stranger. Women that know you willingly concede their favours, for they like white men. In the winter, the people put on the fata and wear it round the waist, on the shoulders, and on the head; but the princes and nobles put trousers on, a shirt and a kaftan (a long coat), wearing a fata on the shoulders, another as a belt round the waist, and a third round the head.

C. Diet

1. Eat rice, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[41]

The food of the Indians consists of rice, and that of the Chinese wheat and rice. The Indians do not eat wheat.

2. Permissible and forbidden food, Alberuni [42]

Originally killing in general was forbidden to them, as it is to the Christians and Manicheans. People, however, have the desire for meat, and will always fling aside every order to the contrary. Therefore the here-mentioned law applies in particular only to the Brahmans, because they are the guardians of the religion, and because it forbids them to give way to their lusts. The same rule applies to those members of the Christian clergy who are in rank above the bishops, viz. the metropolitans, the *catholici,* and the patriarchs, not to the lower grades, such as presbyter and deacon, except in the case that a man who holds one of these degrees is at the same time a monk.

As matters stand thus, it is allowed to kill animals by means of strangulation, but only certain animals, others being excluded. The meat of such animals, the killing of which is allowed, is forbidden in case they die a sudden death. Animals the killing of which is allowed are sheep, goats, gazelles, hares, rhinoceroses *(gandha),* the buffaloes, fish, water and land birds, as sparrows, ring- doves, francolins, doves, peacocks, and other animals which are not loathsome to man nor noxious.

That which is forbidden are cows, horses, mules, asses, camels, elephants, tame poultry, crows, parrots, nightingales, all kinds of eggs and wine. The latter is allowed to the Sudra. He may drink it, but dare not sell it, as he is not allowed to sell meat.

3. Diet in Malabar, Chau Ju-Kua[43]

The people are very dainty in their diet; they have a hundred ways of cooking their food, which varies every day.

There is an officer called *Han-lin* who lays the viands and drinks before the king, and sees how much food he eats, regulating his diet so that he may not exceed the proper measure…

4. Mode of eating and drinking, Marco Polo [44]

It ought to be noticed, that in eating they make use of the right hand only, nor do they ever touch their food with the left. For every cleanly and delicate work they employ the former, and reserve the latter for the base uses of personal abstersion, and other offices connected with the animal functions.

They drink out of a particular kind of vessel, and each individual from his own, never making use of the drinking pot of another person. When they drink they do not apply the vessel to the mouth, but hold it above the head, and pour the liquor into the mouth, not suffering the vessel on any account to touch the lips. In giving drink to a stranger, they do not hand their vessel to him, but, if he is not provided with one of his own, pour the wine or other liquor into his hands, from which he drinks it, as from a cup.

5. Inhabitants of Diu drink rain water, Abulfeda[45]

A traveller states the following: Div is an Island which faces Kanbait (Cambay) from the southern side. Its inhabitants practice piracy and live in reed huts. Their drink is rain water.

6. Rice eaten in India the Less, Friar Jordanus[46]

Wheaten bread is there not eaten by the natives, although wheat they have in plenty; but rice is eaten with its seasoning, only boiled in water. And they have milk and butter and oil, which they often eat uncooked.

7. Hindus eat no meat, Athanasius Nikitin[47]

The Hindoos eat no meat, no cow flesh, no mutton, no chicken. The banquets were all on pork; and pigs are in great abundance. They take their meals twice a day, but not at night, and drink no wine nor mead; but with Mahommedans they neither eat nor drink. Their fare is poor. They eat not with one another nor with their wives, and live on Indian corn, carrots with oil, and different herbs. Always eating with the right hand, they will never set the left hand to anything nor use a knife; the spoon is unknown. In travelling everyone has a stone pot to cook his broth in. They take care that Mahommedans do not look into their pot, nor see their food, and should this happen they will not eat it; some, therefore, hide themselves under a linen cloth lest they should be seen when eating…They sit down to eat, and wash their hands and feet, and rinse their mouths before they do so.

8. Addicted to betel, Marco Polo[48]

All the people of this city [Kael], as well as the natives of India in general, are addicted to the custom of having continually in their mouths the leaf called *tembul;* which they do, partly from habit, and partly from the gratification it affords. Upon chewing it, they spit out the saliva to which it gives occasion. Persons of rank have the leaf prepared with camphor and other aromatic drugs, and also with a mixture of quicklime. I have been told that it is extremely conducive to health.

9. Guests honoured with betel, Shihabuddin al Umari[49]

Shibli told me that wine is not found in Delhi either in public or in secret because this sovereign is so severe against it and dislikes those who are addicted to it. Further the narrator continues: the Indians have no inclination for wine and alcoholic drinks, and content themselves with betel and this is permitted, and is agreeable without doubt and possesses qualities some of which are not found in wine. It perfumes the breath, promotes the digestion, cheers up the soul immensely and imparts extraordinary joy along with strengthening the intellect and clarifying the memory and is delightful in taste. As regards its components it is the leaf of betel, and betel-nut and lime which are specially prepared. He said: the people of this country do not consider an honour greater than this. When a man becomes the guest of another and honours him with all sorts of meals and roasts and sweets and drinks and perfumes and aromatics and he does not present along with them betel, it would not be considered for him an honour and he would not be considered to have honoured him. Likewise when a highly placed person wants to show regard to another, he offers him betel.

D. Dwellings

1. On the Coromandel Coast, Chau Ju-Kua[50]

"The walls of their rooms and the mats they sit on are besmeared with cow-dung, which they look upon as a clean substance. In their houses they set up altars, three feet high and which are reached by three steps, and on which daily in the morning they burn incense and offer flowers; this is called 'the offering to Fo.'"

When Arab *(Ta-shi)* foreigners come to this country they give them seats outside the doors and lodge them in separate houses supplied with beddings and household utensils.

2. Ingeniously contrived cots with mosquito nets, Marco Polo [51]

The natives make use of a kind of bedstead, or cot, of very light cane-work, so ingeniously contrived that when they repose on them, and are inclined to sleep, they can draw close the curtains about them by pulling a string. This they do in order to exclude the tarantulas, which bite grievously, as well as to prevent their being annoyed by fleas and other small vermin; whilst at the same time the air so necessary for mitigating the excessive heat, is not excluded. Indulgences of this nature, however, are enjoyed only by persons of rank and fortune; others of the inferior class lie in the open streets.

3. Ming ambassador on the royal dwelling at Pandua in 1415[52]

The dwelling of the King is all of bricks set in mortar, the flight of steps leading up to it is high and broad. The halls are flat-roofed and white-washed inside. The inner doors are of triple thickness and of nine panels. In the audience hall all the pillars are plated with brass ornamented with figures of flowers and animals, carved and polished. To the right and left are long verandahs on which were drawn up (on the occasion of our audience) over a thousand men in shining armour, and on horseback outside, filling the courtyard, were long ranks of (our) Chinese (soldiers) in shining helmets and coats of mail, with spears, swords, bows and arrows, looking martial and lusty. To the right and left of the King were hundreds of peacock feather umbrellas and before the hall were some hundreds of soldiers mounted on elephants. The king sat cross-legged in the principal hall on a high throne inlaid with precious stones and a two-edged sword lay across his lap.

4. Houses at Cochin, Ma Huan[53]

The houses are built of the wood of the cocoanut tree and are thatched with its leaves, which render them perfectly watertight.

E. Glimpses of people in some parts of India

THE ISLANDS

1. Women rulers in Laccadive and Maldive Islands, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[54]

Between it [Sea of Harkandh i.e., Bay of Bengal] and the Sea of Larvi [Lata for Gujarat] there are numerous islands…These islands are ruled by a woman…

It is said that no one can surpass the inhabitants of these islands in skill to the extent that they make the chemises out of a single piece woven together with the two sleeves, the two gores and the collar. They build boats and houses and work with similar skill in the manufacture of other industries…

2. People in the Andamans, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[55]

On the other side of these [islands] there are two islands, and between them there is the sea. They are called Andaman. Their inhabitants are cannibals. They are black with curly hair, and have ugly faces and eyes and long legs. Each one has a pudenda, that is to say, his penis, nearly a cubit long; and they are naked. They have no canoes; and if they had them, they would have eaten up anyone passing by them. Sometimes it so happens that the boats slow down, and their speed is retarded due to the [strong] wind. The [drinking] water in the boats gets used up; and so they [sailors] approach these (islands) and refill the water. Hence, sometimes they [the cannibals] capture some of them [the sailors], but most of them escape.

3. Barter in Nicobar Islands, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[56]

Lanjabalus…[Its inhabitants] do not understand Arabic nor any of the languages which the merchants know. These people do not wear any clothes. They are white and scanty bearded. They [the sailors] relate that they have never seen their womenfolk. This is because it is the men who come out to them from the island in canoes carved out of a single piece of wood. They carry with them coconut, sugarcane, bananas and coconut wine. This is a kind of drink *(sharab)*, white in colour. When it is taken soon after it is extracted from the palm-tree, it tastes sweet like honey; but if it is left for an hour, it turns into wine *(sharaban)*, and if it is left for some days, it turns into vinegar. They sell it in exchange for iron. Sometimes a little quantity of ambergris is found by them which they sell in exchange for a piece of iron. They carry on commercial transactions by signs, exchanging things by hand, for they do not understand the language. They are expert

swimmers. Sometimes, they carry away the iron forcibly from the merchants and do not give them anything [in return].

4. Ox worshipped in Nicobar Islands, Odoric of Pordenone[57]

Departing from that country and sailing towards the south over the Ocean Sea, I found many islands and countries, where among was one called Nicoveran. And this is a great isle, having a compass of a good 2,000 miles, and both the men and the women there have faces like dogs. And these people worship the ox as their god, wherefore they always wear upon the forehead an ox made of gold or silver, in token that he is their god. All the folk of that country, whether men or women, go naked, wearing nothing in the world but an handkerchief to cover their shame. They be stalwart men and stout in battle, going forth to war naked as they are with only a shield that covers them from head to foot. And if they hap to take any one in war who cannot produce money to ransom himself withal they do straightway eat him. But if they can get money from him they let him go.

And the king of that country weareth round his neck a string of three hundred very big pearls, for that he maketh to his gods daily three hundred prayers. He carrieth also in his hand a certain precious stone called a ruby, a good span in length and breadth, so that when he hath this stone in his hand it shows like a flame of fire. And this, it is said, is the most noble and valuable gem that existeth at this day in the world, and the great emperor of the Tartars of Cathay hath never been able to get it into his possession either by force or by money, or by any device whatever. This king attends to justice and maintains it, and throughout his realm all men may fare safely.

5. People live in caves in the Nicobars, Ma Huan[58]

In the Great Sea are the Tsui-lan shan (the Nicobar Islands). There are three or four islands (in the group). The highest is called Su-tu-man. Sailing before the north-east wind they can be reached from Mao shan (Pulo Weh) in three days.

The people all live in caves. All of them, males as well as females, go naked like wild animals, so they grow no rice, but feed on yams, bananas, jackfruit, and such like things, or on fish and prawns.

There is a foolish story to the effect that if they wore but little piece of cotton to hide their nakedness, they would have ulcers and sores. This is because when anciently the Buddha crossed the sea, on coming here he took

off his clothing and bathed, when the natives stole them. The Buddha thereupon cursed them. It is also commonly said that this is the country of Ch'ih-luan-wu [?].

SIND AND MULTAN

6. The infidels of Sind, Ibn Haukal[59]

The infidels who inhabit Sind are called Budha and Mand. They reside in the tract between Turan, Multan, and Mansura, to the west of the Mihran. They breed camels, which are sought after in Khurasan and elsewhere, for the purpose of having crosses from those of Bactria.

The city where the Budhites carry on their trade is Kandabil, and they resemble men of the desert. They live in houses made of reeds and grass. The Mands dwell on the banks of the Mihran, from the boundary of Multan to the sea, and in the desert between Makran and Famhal. They have many cattle sheds and pasturages, and form a large population.

7. The Jats, Ibn Haukal[60]

Between Mansura and Makran the waters from the Mihran form lakes, and the inhabitants of the country are the Indian races called Zat. Those who are near the river dwell in houses formed of reeds, like the Berbers, and eat fish and aquatic birds…Another clan of them, who live remote from the banks, are like the Kurds, and feed on milk, cheese, and bread made of millet.

8. Jats a robust race, Timur[61]

On the 8th of the month I marched from Ahruni, through the jungle to a village called Tohana. In answer to the inquiries I made about the inhabitants, I learned that they were a robust race, and were called *Jats.* They were Musulmans only in name and had not their equals in theft and highway robbery. They plundered caravans upon the road, and were a terror to Musulmans and travellers. They had now abandoned the village and had fled to the sugarcane fields, the valleys, and the jungles. When these facts reached my ears I prepared a force which I placed under the direction of Tokal Bahadur, son of the Hindu Karkarra, and sent it against the *Jats.* They accordingly marched into the sugarcanes and jungles. I also sent Maulana Nasirud din in pursuit of them. When these forces overtook the *Jats* they

put 200 to the sword and made the rest prisoners. A large stock of cattle was captured, and my soldiers returned to camp.

It was again brought to my knowledge that these turbulent *Jats* were as numerous as ants or locusts, and that no traveller or merchant passed unscathed from their hands. They had now taken flight, and had gone into jungles and deserts hard to penetrate. A few of them had been killed, but it was my fixed determination to clear from thieves and robbers every country that I subdued, so that the servants of God, and Musulmans and travellers might be secure from their violence.

My great object in invading Hindustan had been to wage a religious war against the infidel Hindus, and it now appeared to me that it was necessary for me to put down these *Jats* and to deliver travellers from their hands. I consequently placed the care of the baggage and of all the plunder which had been gained in my victories in the charge of Amir Sulaiman Shah, to convey it with the heavy baggage to the town of Samana.

On the 9th of the month I despatched the baggage from Tohana, and on the same day I marched into the jungles and wilds, and slew 2,000 demon-like *Jats*. I made their wives and children captives, and plundered their cattle and property. Thus I delivered the country from the terror it had long suffered at the hands of the marauding *Jats*.

9. The Meds, Al-Idrisi[62]

Mamhal is situated between Sind and India. Upon the confines of the desert just mentioned there dwells a hardy race called Mand [Med]. They graze their flocks to within a short distance of Mamhal. These people are numerous. They have many horses and camels, and they extend their incursions as far as Dur [Alor] upon the banks of the Mihran, and sometimes they penetrate even as far as the frontiers of Makran.

10. The Nadhas, Al-Idrisi[63]

From Multan to the vicinity of Mansura the country is occupied by a warlike race, called Nadha. It consists of a number of tribes scattered about between Tubaran Makran, Multan, and Mansura, like the Berber nomads. The Nadhas have peculiar dwellings, and marshes in which they take refuge, on the west of the Mihran. They possess excellent camels, and, particularly, a sort which they breed, called Karah. This is held in high esteem in Khurasan and the rest of Persia. It resembles the camel of Balkh

and the female camel of Samarkand, for it is of good temper and has two humps; not like the camels of our countries, which have only one.

11. Inhabitants of Sind, Chau Ju-Kua[64]

"Nan-ni-hua-lo city [perhaps in Sindh] has a triple wall. The inhabitants morning and evening bathe and besmear their bodies with *yu-kin* (turmeric), so as to look like golden coloured images (lit., Buddhas)." A large proportion of them are called P'o-lo-mon (Brahmans), as they are genuine descendants of Fo [Brahma]. ...

The native products include the best quality of putchuck, and fine white flowered (or dotted) cotton stuffs. The people eat much butter, rice, beans and vegetables: they rarely eat fish or meat.

A road leads to the Western Regions (Si-yu); when there are raids (on Nan-ni-hua-lo?) by the light horsemen of the Western Regions [early Muslim invaders of Sindh?], the only resistance they offer is to lock their gates. In a few days provisions run short, and (the raiders) withdraw of their own accord.

12. People in India the Less, Friar Jordanus[65]

Here be many and boundless marvels: and in this first India beginneth, as it were, another world; for the men and women be all black, and they have for covering nothing but a strip of cotton tied round the loins, and the end of it flung over the naked neck...

The people of this India are very clean in their feeding; true in speech, and eminent in justice, maintaining carefully the privilege of every man according to his degree, as they have come down from old times.

SOUTH INDIA

13. People of Malabar, Chau Ju-Kua[66]

The people of this country are of a dark brown complexion, the lobes of their ears reach down to their shoulders. They are skilled in archery and dexterous with the sword and lance. They love fighting and ride elephants in battle, when they also wear turbans of coloured silks.

They are extremely devout Buddhists [a confusion with Hindus].

14. People in Coromandel, Chau Ju-Kua[67]

"The inhabitants are hot-tempered and reckless of life; nay, in the presence of the king they will fight man to man with swords and die without regret."

"Father and son, elder and younger brother, have their meals cooked in separate kettles and served in separate dishes; yet they are deeply alive to family duties."

15. People at T'ien-chu [the coast of Madras?], Chau Ju-Kua[68]

"The country of T'ien-chu is subordinate to the country of Tats'in;" its rulers are all selected by Ta-ts'in.

It is the custom of the people to plait their hair and to let it hang down, but the temples and the crown of the head are covered with a silken turban. In their dwellings they use plaster instead of tiles. They have walled cities in which the people dwell…

They are clever jugglers. They have bows and arrows, armour, spears, flying-ladders, saps, and also the contrivances called the 'wooden oxen' and the 'gliding-horses'; yet they are cowards in battle. They are good astronomers and calculators of calendar (or astrologers). They all study the Si-tan-chang-shu [Siddhanta book of rules]... They use the leaves of the *pei-to* [Sanskrit patra] as paper.

In the periods *chong-kuan* (A.D. 627-650) and *tien-sho'u* (690-692) of the T'ang (this country) sent envoys with tribute (to our Court). In the y*ung-hi* period (of the Sung, A.D. 948-988) a priest by name Lo-hu-na [Rahula?] arrived (in Ts'uan-cho'u) by sea; he called himself a native T'ien-chu. The foreign traders, considering that he was a foreign priest, vied with each other in presenting him gold, silks, jewels and precious stones, but the priest had no use for them himself. He bought a piece of ground and built a Buddhist shrine in the southern suburb of Ts'uan-chou; it is the Pau-lin-yuan of the present day.

16. People at Hili [Ely, on the Malabar Coast], Wang Ta-Yuan[69]

The climate is hot, the usages of the people pure. They are hot-headed, and wherever they go, they carry about with them their bows and arrows. Men and women cut their hair and wrap around them *Liu pu* (i.e., cotton cloth from the Maldive Islands).

They cede the path to each other; they will not pick up things on the highways; their customs approach those of antiquity (in honesty). Should

anyone steal an ox, the chief verifies the number of oxen, and (or) the rightful owner seizes all the property of the offender, and he is put to death.

17. Customs at Malabar, Ibn Battuta[70]

Mulaybar [Malabar]…is the pepper country. It extends for two months' journey along the coast from Sandabur [Goa] to Kawlam [Quilon, in Travancore]. The road over the whole distance runs beneath the shade of trees, and at every half-mile there is a wooden shed with benches on which all travellers, whether Muslims or infidels, may sit. At each shed there is a well for drinking and an infidel who is in charge of it. If the traveller is an infidel he gives him water in vessels; if he is a Muslim he pours the water into his hands, continuing to do so until he signs to him to stop. It is the custom of the infidels in the Mulaybar lands that no Muslim may enter their houses or eat from their vessels; if he does so they break the vessels or give them to the Muslims. In places where there are no Muslim inhabitants they give him food on banana leaves. At all the halting-places on this road there are houses belonging to Muslims, at which Muslim travellers alight, and where they buy all that they need. Were it not for them no Muslim could travel by it.

On this road, which, as we have said, extends for a two months' march, there is not a foot of ground but is cultivated. Every man has his own orchard, with his house in the middle and a wooden palisade all round it. The road runs through the orchards, and when it comes to a palisade there are wooden steps to go up by and another flight of steps down into the next orchard. No one travels on a animal in that country, and only the sultan possesses horses. The principal vehicle of the inhabitants is a palanquin carried on the shoulders of slaves or hired porters; those who do not travel on palanquins go on foot, be they who they may. Baggage and merchandise is transported by hired carriers, and a single merchant may have a hundred such or thereabouts carrying his goods. I have never seen a safer road than this, for they put to death anyone who steals a single nut, and if any fruit falls no one picks it up but the owner. Indeed we sometimes met infidels during the night on this road, and when they saw us they stood aside to let us pass. Muslims are most highly honoured amongst them, except that, as we have said, they do not eat with them nor allow them into their houses. In the Mulaybar lands there are twelve infidel sultans, some of them strong

with armies numbering fifty thousand men, and others weak with armies of three thousand. Yet there is no discord whatever between them, and the strong does not desire to seize the possessions of the weak. At the boundary of the territories of each ruler there is a wooden gateway, on which is engraved the name of the ruler whose territories begin at that point. This is called the 'Gate of Security' of such-and-such a prince. If any Muslim or infidel criminal flees from the territories of one and reaches the Gate of Security of another, his life is safe, and the prince from whom he has fled cannot seize him, even though he be a powerful, prince, with a great army. The rulers in these lands transmit their sovereignty to their sister's sons, to the exclusion of their own children.

Barcelore

The first town in the land of Mulaybar that we entered was the town of Abu-Sarur [Barcelore], a small place on a large inlet and abounding in coco-palms. Two days journey brought us to Fakanur [Bacanor, now Barkur], a large town on an inlet; here there is a large quantity of sugar canes, which are unexcelled in the rest of that country. The chief of the Muslim community at Fakanur is called Basadaw. He possesses about thirty warships, commanded by a Muslim called Lula, who is an evildoer and a pirate and a robber of merchants. When we anchored, the sultan sent his son to us to stay on board the ship as a hostage. We went on shore to visit him and he treated us with the utmost hospitality for three nights, as a mark of respect for the sultan of India and also from a desire to make some profit by trading with the personnel of our vessels. It is a custom of theirs that every ship that passes by a town must needs anchor at it and give a present to the ruler. This they call the 'right of *bandar.'* If anyone omits to do this, they sail out in pursuit of him, bring him into the port by force, double the tax on him, and prevent him from proceeding on his journey for as long as they wish. Three days after leaving Fakanur we reached Manjarur [Mangalore], a large town on the inlet called ad-Dumb, which is the largest inlet in the land of Mulaybar. This is the town at which most of the merchants from Fars and Yemen disembark, and pepper and ginger are exceedingly abundant there. The sultan of Manjarur is one of the principal rulers in that land, and his name is Rama Daw. There is a colony of about four thousand Muslims there, living in a suburb alongside the town. Conflicts frequently

break out between them and the townspeople, but the sultan makes peace between them on account of his need of the merchants.

Eli

After staying at Manjarur for three days, we set sail for the town of Hili [Ili or Eli], which we reached two days later. It is large and well-built, situated on a big inlet which is navigable for large vessels. This is the farthest town reached by ships from China; they enter only this port, the port of Kawlam, and Calicut. The town of Hili is venerated by both Muslims and infidels on account of its cathedral mosque, and seafarers make many votive offerings to it. This mosque contains a number of students, who receive stipends from its revenues, and it has a kitchen from which travellers and the Muslim poor are supplied with food. Thence we sailed to Jurfattan [Cannanore], Dahfattan, and Budfattan; the sultan of these towns is called Kuwayl, and is one of the most powerful sultans of Mulaybar. At Dahfattan there is a great *ba'in* and a cathedral mosque, which were built by Kuwayl's grandfather, who was converted to Islam. Most of the inhabitants of Budfattan are Brahmans, who are venerated by the infidels and who hate the Muslims; for this reason there are no Muslims living among them. From Budfattan we sailed to Fanda-rayna [Panderani], a large and fine town with orchards and bazaars. The Muslims occupy three quarters in it, each of which has a mosque. It is at this town that the Chinese vessels pass the winter. Thence we travelled to the city of Qaliqut [Calicut], which is one of the chief ports in Mulaybar and one of the largest harbours in the world. It is visited by men from China, Sumatra, Ceylon, the Maldive, Yemen and Fars, and in it gather merchants from all quarters.

18. People at Cochin, Fel Hsin[71]

Men and women do their hair in a knot and wear a short shirt and a piece of cotton stuff wrapper around them.

There is a caste of people called Mu-kua (Mukuva); they have no dwellings but live in caves, or nests in the trees. They make their living by fishing in the sea. Both sexes go with the body naked and with a girdle of leaves or grass hanging before and behind. If one of them meets someone, he must crouch down and hide himself by the way side, where he must wait until he has passed by.

In their customs they are very honest. Those walking along make way for each other; they will not pick up anything on the road. They have not the bastinado as a punishment, they draw a circle with lime on the ground which (the culprit) is forbidden (to pass beyond). .

19. People at Honavar, Ibn Battuta[72]

Next day we reached the town of Hinawr [Honavar, Onore], which is on a large inlet navigable for large ships. During the *pushkal,* which is the rainy season, this bay is so stormy that for four months it is impossible to sail on it except for fishing. The women of this town and all the coastal districts wear nothing but loose unsewn garments, one end of which they gird round their waists, and drape the rest over their head and shoulders. They are beautiful and virtuous, and each wears a gold ring in her nose. One peculiarity amongst them is that they all know the Koran by heart. I saw in the town thirteen schools for girls and twenty-three for boys, a thing which I have never seen elsewhere. Its inhabitants live by maritime commerce, and have no cultivated land. The ruler of Hinawr is Sultan Jalal ad-Din, who is one of the best and most powerful sultans. He is under the suzerainty of an infidel sultan named Haryab...The people of Mulaybar [Malabar] pay a fixed sum annually to Sultan Jala ad-Din, through fear of his sea-power. His army is composed of about six thousand men, horse and foot. On another occasion I stayed for eleven months at his court without ever eating bread, for their sole food is rice.

20. People at Vijayanagar richly adorned, Abder Razzak[73]

This empire contains so great a population that it would be impossible to give an idea of it without entering into the most extensive details. In the king’s palace are several cells, like basins, filled with bullion, forming one mass. All the inhabitants of this country, both those of exalted rank and of an inferior class, down to the artizans of the bazaar, wear pearls, or rings adorned with precious stones, in their ears, on their necks, on their arms, on the upper part of the hand, and on the fingers.

EASTERN INDIA

21. Magadha, Chau Ju-Kua[74]

Concerning. Wang-sho-ch'ong [Magadha], tradition says that north of Kiau-chi (Tongking), "one comes to Ta-li (Yun-nan) and west of Tali one comes to Wang-sho-ch'ong in less than forty days journey."…

P'ong-k'ie-lo of the West has a capital called Ch'a-na-ki [?]. The city walls are 120 *li* in circuit. The common people are combative and devoted solely to robbery. They use (pieces of) white conch shells ground into shape as money. The native products include fine swords, *to'u-lo* [tula, Sanskrit, cotton] cotton stuffs and common cotton cloth.

Some say that the law of the Buddha originated in this country for Huan-tsang, the master of the *Tripitaka* in the T'ang period, (when) he got the Buddhist Classic (to bring to China) had already reached the West.

22. The people of Bengal, Wang Ta-yuan[75]

These people owe all their tranquility and prosperity to themselves, for its source lies in their devotion to agriculture, whereby a land originally covered with jungle has been reclaimed by their unremitting toil in tilling and planting…The riches and integrity of its people surpass, perhaps, those of Ch'iu-chiang (Palembang) and equal those of Chao-wa (Java).

23. An account by a Chinese envoy at Padua in 1415 AD[76]

[The men] wear a white cotton turban and a long white cotton shirt. On their feet they wear low sheepskin shoes with gold thread. The smarter ones think it the correct thing to have designs on them. Everyone of them is engaged in business, the value of which may be ten thousand pieces of gold.

WESTERN INDIA

24. People of Hu-ch'a-la [the earliest reference to Gujarat in a Chinese work], Chau Ju-Kua[77]

The inhabitants of this country are white and clean looking; both men and women wear double rings hanging down from holes in their ears; they wear close fitting clothes with a cotton sarong wrapped around them. On their heads they wear white hoods, and on their feet shoes of red leather. They are forbidden to eat flesh.

25. The Marathas, Ibn Battuta [78]

The inhabitants of Dawlat Abad belong to the tribe of Marhata [Marathas], whose women God has endowed with special beauty,

particularly in their noses and eyebrows. The infidels of this town are merchants, dealing principally in jewels, and their wealth is enormous. In Dawlat Abad there is an exceedingly fine and spacious bazaar for singers and singing-girls, containing numerous shops, each of which has a door leading to the house of its proprietor. The shop is beautified with carpets, and in the centre of it there is a sort of large cradle on which the singing-girl sits or reclines. She is adorned with all kinds of ornaments and her attendants swing her cradle. In the centre of the bazaar there is a large carpeted and decorated pavilion in which the chief musician sits every Thursday after the afternoon prayer, with his servants and slaves in front of him. The singing-girls come in relays and sing and dance before him till the sunset prayer, when they withdraw. In the same bazaar there are mosques for the prayer-services. One of the infidel rulers in India used, on passing through this bazaar, to alight at the pavilion and the singing-girls used to sing before him. One of the Muhammadan sultans used to do the same.

We continued on our way to Nadhurbar (Nandur-bar], a small town inhabited by the Marhatas, who possess great skill in the arts and are physicians and astrologers. The nobles of the Marhatas are Brahmans and Katris [Kshatriyas]. Their food consists of rice, vegetables, and oil of sesame, and they do not hold with giving pain to or slaughtering animals. They wash themselves thoroughly before eating and do not marry among their relatives, unless those who are cousins six times removed. Neither do they drink wine, for this in their eyes is the greatest of vices.

26. People at Chaoul, a flourishing seaport before the Portuguese conquest, thirty miles south-east of Bombay, Athanasius Nikitin[79]

This is an Indian country. People go about naked; with their heads uncovered and bare breasts; the hair tressed into one tail, and thick bellies. They bring forth children every year and the children are many; and men and women are black. When I go out many people follow me, and stare at the white man.

Their kniaz [Russian for chief] wears a *fata* [a silken garment] on the head; and another on the loins; the boyars wear it on the shoulders and on the loins; the *kniaginies* wear it also round the shoulders and the loins. The servants of the kniaz and of the boyars attach the *fata* round the loins, carrying in the hand a shield and a sword, or a scimitar, or knives, or a

sabre, or a bow and arrows – but all naked and barefooted. Women walk about with their heads uncovered and their breasts bare. Boys and girls go naked till seven years, and do not hide their shame.

KASHMIR

27. The people of Kashmir, Rashidu-d Din[80]

The people of Kashmir do not ride on quadrupeds, but are carried on men's shoulders in a Katut, which resembles a throne. The servants of the Government are always on the alert, and watch the passes and strongholds of the country. They do not allow strangers to enter the country, except by ones and twos. This prohibition extends even to Jews and Hindus, how then can anyone else gain admittance? The principal entrance is at Birahan, half way between the Sind and Jailam. From that place to the bridge, at the confluence with the Jailam of the Kusari and Mamhari, which flow from the mountains of Shamilan, is eight parasangs. Thence you arrive, at a distance of five days' journey, at a defile through which the Jailam runs.

At the end of the defile lies Dawaru-l Marsad, on both sides of the river. There the Jailam enters the plains, and turns towards Adashtan [Puranadhishtana, the 'old chief city'], the capital of Kashmir, which it reaches at a distance of two days' journey. The city of Kashmir is four parasangs from Adashtan. It is built on both banks of the Jailam, on which there are many bridges and boats. The source of the Jailam is in the mountains of Harmakut, near the source of the Ganges. This mountain is impassable on account of the exceeding cold, for the snow never melts, even when the sun is in Cancer or Leo. On the other side of it lies Maha Chin, *i.e.,* great Chin. After the Jailam has left the mountains, it reaches Adashtan in two days. Four parasangs from that, it expands into a lake, a parasang square on the borders of which there is much cultivation, and a dense population. It then leaves the lake, and enters another defile near the city of Ushkara.

F. Festivals

1. Festivals at Vijayanagar, Nicolo Conti[81]

Thrice in the year they keep festivals of especial solemnity. On one of these occasions the males and females of all ages, having bathed in the

rivers or the sea, clad themselves in new garments, and spend three entire days in singing, dancing, and feasting. On another of these festivals they fix up within their temples, and on the outside on the roofs, an innumerable number of lamps of oil of Susimanni, which are kept burning day and night [On Dipavali oil lamps are lighted only at night not during daytime].

On the third, which lasts nine days [Mahanavami or Dasara], they set up in all the highways large beams, like the masts of small ships, to the upper part of which are attached pieces of very beautiful cloth of various kinds, interwoven with gold. On the summit of each of these beams is each day placed a man of pious aspect, dedicated to religion, capable of enduring all things with equanimity, who is to pray for the favour of God. These men are assailed by the people, who pelt them with oranges, lemons, and other odoriferous fruits, all which they bear most patiently. There are also three other festival days, during which they sprinkle all passers by, even the king and queen themselves, with saffron-water [probably description of 'holi'], placed for that purpose by the wayside. This is received by all with much laughter.

2. The Mahanadi festival at Vijayanagar, Abder Razzak[82]

The idolaters, who exercise an imposing authority in this country, with a view of displaying their pride, their power, their tyranny, and their glory, prepare every year a royal feast, a banquet worthy of a sovereign. This solemnity bears the name of Mahanadi. The manner in which it is celebrated is as follows. In pursuance of orders issued by the king of Bidjanagar, the generals and principal personages from all parts of his empire, which extends over a space of three months' journey, presented themselves at the palace.

They brought with them a thousand elephants, resembling the waves of a troubled sea, or a stormy cloud, which were covered with brilliant armour, and with castles magnificently adorned, in which were jugglers and artificers. On the trunks and ears of these animals had been drawn, with cinnabar and other substances, extraordinary pictures and figures of wonderful beauty. When the chiefs of the army, with the eminent personages and learned Brahmins from each province, as well as the elephants, were collected at the appointed time in the palace, during three consecutive days, in the month of *Redjeb,* the vast space of land

magnificently decorated, in which the enormous elephants were congregated together, presented the appearance of the waves of the sea, or of that compact mass of men which will be assembled together at the day of the resurrection. Over this magnificent space were erected numerous pavilions, to the height of three, four, and five stories, covered from top to bottom with figures in relief. They represented everything that the imagination can picture, men, wild beasts, birds, and animals of every kind, down to flies and gnats: everything was drawn with extraordinary skill and delicacy. Some of these pavilions were arranged in such a manner, that they could turn rapidly round and present a new face. At each moment a new chamber or a new hall presented itself to the view.

In the front of this place rose a palace with nine pavilions, magnificently ornamented. In the ninth the king's throne was set up. In the seventh was allotted a place to the humble author of this narrative, from which everyone was excluded excepting the author's friends. Between the palace and the pavilions, in an extremely beautiful situation, were musicians and storytellers, who sang and invented tales. The part of musicians is generally filled by women. Some young girls, with cheeks as full as the moon, and with faces more lovely than the spring, clothed in magnificent dresses, and showing features which, like the freshest rose, charmed every heart, were placed behind a pretty curtain opposite the king. On a sudden the curtain was raised and again fell, and the damsels arranged themselves for the dance, with a grace calculated to seduce every sense and captivate every mind. The jugglers execute some feats of skill which are quite wonderful: they place on the ground three pieces of wood, which touch each other, each of which is one cubit in length, half a cubit in breadth, and three quarters of a cubit in height; on the top of the two first they place two other pieces, of nearly the same length and breadth, and above the second piece, which lies on the top of the first, they place another, a little smaller, so that the first and second pieces of wood form as it were steps by which to reach the third piece, which crowns the whole. A large elephant, trained to this exercise, stepping upon the first and second pieces of wood ascends the third, the surface of which is scarcely broader than the sole of one of the feet of this animal. While the elephant supports himself with his four feet upon this beam, they raise behind him the other pieces of wood. The animal once placed on the top of this beam, follows with his trunk all the airs which the

musicians play, and moving in cadence with the time, raises and lowers his trunk alternately.

After this they erect a column of ten *ghez* in height, on the top of which they fix a long piece of wood, like the beam of a pair of scales, and which has a hole in the middle. At one end of this beam they attach a stone, the weight of which is equivalent to that of the elephant, and at the other end, at the distance of one *ghez* they place a broad plank, which is of one *ghez* in length; by means of a cord they lower the end to which the plank is fastened and on this the elephant mounts. His keeper then lets go the cord by little and little, until the two extremities of the piece of wood are exactly balanced, like the beams of a pair of scales, and at a height of ten *ghez*. This piece of wood, one end of which bears the elephant and the other a stone of corresponding weight, turns, after the fashion of a semicircle, making a half rotation from right to left, in presence of the king; and in this elevated position the elephant follows all the airs of the musicians, and makes the movements in cadence.

All the musicians, orators, and jugglers, receive from the king gold and suits of apparel. During three consecutive days, from the moment when the burning sun like a peacock of enchanting plumage displayed himself proudly in the midst of the heavens, until that in which the raven of darkness unfolded its wings, the royal festival, was prolonged in a style of the greatest magnificence.

It would be impossible, without entering into details of too great a length, to describe in this place the picture of the different kinds of fireworks, sports in which fireworks were employed and games and amusements which this fete presented. On the third day, at the moment when the king arose, the humble author of this narrative was conducted into the presence of the monarch. The throne, which was of an extraordinary size, was made of gold, and enriched with precious stones of extreme value; the whole workmanship was perfect in its delicacy and ingenuity. It is probable, that in all the kingdoms of the world, the art of inlaying precious stones is no where better understood than in this country.

Meeting with King

Before the throne was a square cushion, on the edges of which were sewn three rows of pearls of the most beautiful water. During the three days the

king remained seated on this cushion behind the throne. When the fete of Mahanadi was ended, at the hour of evening prayer, the monarch sent to summon me. On my arrival at the palace I was introduced in the midst of four *estrades,* which were about ten *ghez* both in length and in breadth. The roof and the walls were entirely formed of plates of gold, enriched with precious stones.

Each of these plates was as thick as the blade of a sword, and was fastened with golden nails. Upon the *estrade*, in the front, is placed the throne of the king, and the throne itself is of very great size. The pomp of the king when seated thereon was most imposing. He questioned me on particular points respecting his majesty the happy Khakan, his emirs, his troops, the numbers of his horses, and also respecting his great cities, such as Samarcand, Herat, and Shirez. He expressed towards the emperor sentiments of the greatest friendship, and said to me: "I shall send, together with an able ambassador, some rows of elephants, two *tokouz* (twice nine) of eunuchs, and other presents."

G. Funeral ceremonies

1. Funeral rites, Alberuni[83]

In the most ancient times the bodies of the dead were exposed to the air by being thrown on the fields without any covering; also sick people were exposed on the fields and in the mountains, and were left there. If they died there, they had the fate just mentioned; but if they recovered, they returned to their dwellings.

Thereupon there appeared a legislator who ordered people to expose their dead to the wind. In consequence they constructed roofed buildings with walls of rails, through which the wind blew, passing over the dead, as something similar is the case in the grave-towers of the Zoroastrians.

After they had practised this custom for a long time, Narayana prescribed to them to hand the dead over to the fire, and ever since they are in the habit of burning them, so that nothing remains of them, and every defilement, dirt and smell is annihilated at once, so as scarcely to leave any trace behind.

Greeks parallels

Nowadays the Slavonians, too, burn their dead, whilst the ancient Greeks seem to have had both customs, that of burning and that of burying.

Socrates speaks in the book *Phaedo,* after Crito had asked him in what manner he wanted to be buried: “As you wish, when you make arrangements for me. I shall not flee from you.” Then he spoke to those around him: “Give to Crito regarding myself the opposite guarantee of that which he has given to the judges regarding myself; for he guaranteed to them that I should stay, whilst you now must guarantee that I shall not stay after death, I shall go away, that the look of my body may be tolerable to Crito when it is *burned* or *buried,* that he may not be in agony, and not say: ‘Socrates is carried away, or is burned or buried.’ Thou, O Crito, be at ease about the burial of my body. Do as thou likest, and especially in accordance with the laws.”

Galenus says in his commentary to the apothegms of Hippocrates: “It is generally known that Asclepius was raised to the angels in a column of fire, the like of which is also related with regard to Dionysos, Heracles, and others, who laboured for the benefit of mankind. People say that God did thus with them in order to destroy the mortal and earthly part of them by the fire, and afterwards to attract to himself the immortal part of them, and to raise their souls to heaven.”

In these words, too, there is a reference to the burning as a Greek custom, but it seems to have been in use only for the great men among them.

In a similar way the Hindus express themselves. There is a point in man by which he is what he is. This point becomes free when the mixed elements of the body are dissolved and scattered by combustion.

Fire nearest road to God

Regarding this return (of the immortal soul to God), the Hindus think that partly it is effected by the rays of the sun, the soul attaching itself to them and ascending with them, partly by the flame of the fire, which raises it (to God). Some Hindu used to pray that God would make his road to himself a straight line, because this is the nearest road, and that there is no other road upwards save the fire or the ray.

Similar to this is the practice of the Ghuzz Turks with reference to a drowned person; for they place the body on a bier in the river, and make a cord hang down from his foot, throwing the end of the cord into the water. By means of this cord the spirit of the deceased is to raise himself for resurrection.

The belief of the Hindus on this head was confirmed by the words of Vasudeva, which he spoke regarding the sign of him who is liberated from the fetters (of bodily existence). "His death takes place during *utta-rayana (i.e.* the northern revolution of the sun from the winter solstice to the summer solstice), during the white half of the month, *between lighted lamps, i.e.* between conjunction and opposition (new moon and full moon), in the seasons of winter and spring."

Similar views of Mani

A similar view is recognised in the following words of Mani: "The other religious bodies blame us because we worship sun and moon, and represent them as an image. But they do not know their real natures; they do not know that sun and moon are our path, the door whence we march forth into the world of our existence (into heaven), as this has been declared by Jesus." So he maintains.

People relate that Buddha had ordered the bodies of the dead to be thrown into flowing water. Therefore his followers, the Shamanians, throw their dead into the rivers.

Manner of burial

According to the Hindus, the body of the dead has the claim upon his heirs that they are to wash, embalm, wrap it in a shroud, and then to burn it with as much sandal and other wood as they can get. Part of his burned bones are brought to the Ganges and thrown into it, that the Ganges should flow over them, as it has flowed over the burned bones of the children of Sagara, thereby forcing them from hell and bringing them into paradise. The remainder of the ashes is thrown into some brook of running water. On the spot where the body has been burned they raise a monument similar to a milestone, plastered with gypsum. The bodies of children under three years are not burned.

Those who fulfil these duties towards the dead afterwards wash themselves as well as their dresses during two days, because they have become unclean by touching the dead.

Those who cannot afford to burn their dead will either throw them somewhere on the open field or into running water…

Tree of Prayag

At the junction of the two rivers, Yamuna and Ganges, there is a great tree called *Prayaga,* a tree of the species called *vata.* It is peculiar to this kind of tree that its branches send forth two species of twigs, some directed upward, as is the case with all other trees, and others directed downward like roots, but without leaves. If such a twig enters into the soil, it is like a supporting column to the branch whence it has grown. Nature has arranged this on purpose, since the branches of this tree are of an enormous extent (and require to be supported). Here the Brahmans and Kshatriyas are in the habit of committing suicide by climbing up the tree and throwing themselves into the Ganges.

Greek parallels

Johannes Grammaticus relates that certain people in ancient Greek heathendom, "whom I call the wor*shippers of the devil"* – so he says – used to beat their limbs with swords, and to throw themselves into the fire, without feeling any pain there from.

As we have related this as a view of the Hindus not to commit suicide, so also Socrates speaks: "Likewise it does not become a man to kill himself before the gods give him a cause in the shape of some compulsion or *dire necessity,* like that in which we now are."

Further he says: "We human beings are, as it were, in a prison. It does not behove us to flee nor to free ourselves from it, because the gods take notice of us, since we, the human beings, are servants to them."

2. Maha Brahmin funeral priests, Gardizi[84]

Another group are the MAHABRI.FTI [Maha Brahmin, a despised section of Brahmins who perform funeral rites?]. Their custom is that a man goes to a graveyard and there collects the burnt bones of the dead. Then he enters a village and cries abusing the people: "O, rebels, o sinners, who have become captives of your passion and slaves of your nature and have succumbed (*uftada*) to the rebellion (*fitna*) of your passions. How long will you be killing your fathers and raping your mothers?" that is to say, "men and women will never reach repentance (*tauba na-yaband*) until they have become like me and trodden my path; let them know themselves and humble themselves in order to endear themselves (to God)".

3. Do not raise tombs, Al-Idrisi[85]

The people of India burn their dead and do not raise tombs for them. When the king dies they construct a vehicle of an appropriate size, and raised about two palms above the ground. On this they place the bier surmounted by the crown, and the corpse, clad in all its funeral ornaments, being laid upon the bier, it is dragged by slaves all round the city. The head is uncovered and the hair drags upon the ground. This is done that every one may see (the corpse), and a herald goes before uttering, in the Indian language, words of which the following is the sense, – "People! behold your king, so and so by name, son of so and so. He lived happily and mightily for so many years. He is no more, and all that he possessed has escaped from his hands. Nothing now remains to him and he will feel no more pain. Remember, he has shown you the way which you must follow." This being said, when all the ceremonies are concluded, they take the corpse to the place where the bodies of kings are burnt, and commit it to the flames. These people do not grieve and lament very much on these occasions.

In all the countries of Hind and Sind there are Musulmans and they bury their dead secretly by night in their houses, but like the Indians they do not give way to long lamentations.

4. Embalming, Rabbi Benjamin of Tudela[86]

The inhabitants do not bury their dead, but embalm them with certain spices, put them upon stools and cover them with cloths, every family keeping apart. The flesh dries upon the bones and as these corpses resemble living beings, one of them recognises his parents and all the members of his family for many years to come.

❑

CHAPTER — 3

Languages, Literature, Science, Legal System

A. Languages
B. Literature
C. Science
D. Legal System

A. Languages

1. Language of Sindh different from that of India, Al Masudi[1]

The language of Sind is different from that of India. Sind is the country which is nearer the dominions of the Moslims, India is farther from them. The inhabitants of Mankir, which is the capital of the Balhara, speak the Kiriya [Kannada] language, which has this name from Kira, the place where it is spoken. On the coast, as in Saimur, Subara, Tana, and other towns, a language called Lariya [an early form of Prakrit] is spoken which has its name from the sea which washes these countries [Sanskrit Lata, the region about the mouth of the Narmada]; and this is the Larawi sea, which has been described above.

2. Sanskrit – language of enormous range, Alberuni[2]

(Sanskrit is a language) of an enormous range, both in words and inflections, something like the Arabic, calling one and the same thing by various names, both original and derived, and using one and the same word for a variety of subjects, which, in order to be properly understood, must be distinguished from each other by various qualifying epithets, for nobody could distinguish between the various meanings of a word unless he understands the context in which it occurs, and its relation both to the following and the preceding parts of the sentence. The Hindus, like other people, boast of this enormous range of their language, whilst in reality it is a defect.

Further, the language is divided into a neglected vernacular one, only in use among the common people, and a classical one, only in use among the upper and educated classes, which is much cultivated, and subject to the rules of grammatical inflection and etymology, and to all the niceties of grammar and rhetoric.

Besides, some of the sounds (consonants) of which the language is composed are neither identical with the sounds of Arabic and Persian, nor resemble them in any way. Our tongue and uvula could scarcely manage to correctly pronounce them, nor our ears in hearing to distinguish them from similar sounds, nor could we transliterate them with our characters. It is very difficult, therefore, to express an Indian word in our writing, for in order to fix the pronunciation we must change our orthographical points and signs, and must pronounce the case-endings either according to the common Arabic rules or according to special rules adapted for the purpose…

As in other foreign tongues, so also in Sanskrit, two or three consonants may follow each other without an intervening vowel – consonants which in our Persian grammatical system are considered as having a *hidden* vowel. Since most Sanskrit words and names begin with such consonants without vowel, we find it very difficult to pronounce them.

Besides, the scientific books of the Hindus are composed in various favourite metres, by which they intend, considering that the books soon become corrupted by additions and omissions to preserve them exactly as they are, in order to facilitate their being learned by heart, because they consider as canonical only that which is known by heart, not that which exists in writing. Now it is well known that in all metrical compositions there is much misty and constrained phraseology merely intended to fill up the metre and serving as a kind of patchwork, and this necessitates a certain amount of verbosity. This is also one of the reasons why a word has sometimes one meaning and sometimes another.

From all this it will appear that the metrical form of literary composition is one of the causes which make the study of Sanskrit literature so particularly difficult.

3. Instruments of writing, Alberuni[3]

The Hindus have in the south of their country a slender tree like the date and cocoanut palms, bearing edible fruits and leaves of the length of one yard, and as broad as three fingers, one put beside the other. They call these leaves *tari (tala* or *tar = Borassus fla-belliformis),* and write on them. They bind a book of these leaves together by a cord on which they are arranged, the cord going through all the leaves by a hole in the middle of each.

In Central and Northern India people use the bark of the *tuz* tree, one kind of which is used as a cover for bows. It is called *bhurja.* They take a piece one yard long and as broad as the outstretched fingers of the hand, or somewhat less, and prepare it in various ways. They oil and polish it so as to make it hard and smooth, and then they write on it. The proper order of the single leaves is marked by numbers. The whole book is wrapped up in a piece of cloth and fastened between two tablets of the same size. Such a book is called *puthi (cf. pusta, pustaka).* Their letters, and whatever else they have to write, they write on the bark of the *tuz* tree.

Alphabet

As to the writing or alphabet of the Hindus...it once had been lost and forgotten; that nobody cared for it, and that in consequence people became illiterate, sunken into gross ignorance, and entirely estranged from science. But then Vyasa, the son of Parasara, rediscovered their alphabet of fifty letters by an inspiration of God. A letter is called *akshara.*

Some people say originally the number of their letters was less, and that it increased only by degrees. This is possible, or I should even say necessary…

The great number of the letters of the Hindu alphabet is explained, firstly, by the fact that they express every letter by a separate sign if it is followed by a vowel or a diphthong or a *hamza (visarga),* or a small extension of the sound beyond the measure of the vowel; and, secondly, the fact that they have consonants which are not found together in any other language, though they may be found scattered through different languages – sounds of such a nature that *our* tongues, not being familiar with them, can scarcely pronounce them, and that *our* ears are frequently not able to distinguish between many a cognate pair of them.

Write left to right like Greeks

The Hindus write from the left to the right like the Greeks. They do not write on the basis of a line, above which the heads of the letters rise whilst their tails go down below, as in Arabic writing. On the contrary, their ground-line is above, a straight line above every single character, and from this line the letter hangs down and is written under it. Any sign *above* the line is nothing but a grammatical mark to denote the pronunciation of the character above which it stands.

Siddhamatrika

The most generally known alphabet is called *Siddhamatrika* which is by some considered as *originating* from Kashmir, for the people of Kashmir use it. But it is also used in Varanasi. This town and Kashmir are the high schools of Hindu sciences. The same writing is used in Madhyadesa, *i,e.* the middle country, the country all around Kanauj, which is also called Arya-varta.

Nagara

In Malava there is another alphabet called *Nagara,* which differs from the former only in the shape of the characters.

Ardhanagari

Next comes an alphabet called *Ardhanagari i.e. half-nagara,* so called because it is compounded of the former two. It is used in Bhatiya and some parts of Sindh.

Other alphabets

Other alphabets are the *Malwari,* used in Malwashau, in Southern Sind, towards the seacoast; the *Saindhava,* used in Bahmanwa or Almansura; the *Karnata,* used in Karnatadesa, whence those troops come which in the armies are known as *Kannara;* the *Andhri,* used in Andhradesa; the *Dirwari (Dravidi),* used in Dirwara-desa (Dravidadesa); the *Lari,* used in Laradesa (Lata-desa); the *Gauri (Gaudi),* used in Puryadesa, *i.e.* the Eastern country; the *Bhaikshuki,* used in Udunpur in Purvadesa. This last is the writing of Buddha.

On the word Om

The Hindus begin their books with *Om,* the word of creation, as we begin them with ‘In the name of God.’ The figure of the word *om* is…This figure does not consist of letters; it is simply an image invented to represent this word, which people use, believing that it will bring them a blessing, and meaning thereby a confession of the unity of God. Similar to this is the manner in which the Jews write the name of God, viz. by three Hebrew *yods.* In the Thora the word is written *YHVH* and pronounced *Adonai;* something they also say *Yah.* The word *Adonai,* which they pronounce is not expressed in writing.

Numerical signs

The Hindus do not use the letters of their alphabet for numerical notation, as we use the Arabic letters in the Hebrew alphabet. As in different parts of India the letters have different shapes, the numeral signs too, which are called *anka,* differ. The numeral signs which *we* use are derived from the finest forms of the Hindu signs. Signs and figures are of no use if people do not know what they mean, but the people of Kashmir mark the single leaves of their books with figures which look like drawings or like the Chinese characters, the meaning of which can only be learned by a very long practice. However, they do not use them when reckoning in the sand.

In arithmetic all nations agree that all the *order* of numbers *(e.g.* one, ten, hundred, thousand) stand in a certain relation to the ten; that each order is the tenth part of the following and the tenfold of the preceding. I have studied the names of the *orders* of the numbers in various languages with all kinds of people with whom I have been in contact, and have found that no nation goes beyond the thousand. The Arabs, too, stop with the thousand, which is certainly the most correct and the most natural thing to do. I have written a separate treatise on this subject.

Those, however, who go beyond the thousand in their numeral system are the Hindus, at least in their arithmetical technical terms, which have been either freely invented or derived according to certain etymologies, whilst in others both methods are blended together. They extend the names of the *orders* of numbers until the 18th *order* for religious reasons, the mathematicians being assisted by the grammarians with all kinds of etymologies.

The 18th *order* is called *Parardha, i.e.,* the half of heaven, or, more accurately, *the half of that which is above.* For if the Hindus construct periods of time out of Kalpas, the unit of this *order* is *a day of God (i.e.* a half *nychthemeron).* And as we do not know any body larger than heaven, half of it *(parardha),* as *a half of the greatest body,* has been compared with *a half of the greatest day.* By doubling it, by uniting night to day, we get the *whole* of the greatest day. There can be no doubt that the name *Parardha* is accounted for in this way, and that *parar* means *the whole of heaven...*

Some Hindus maintain *that there is a 19th order beyond the Parardha, called Bhuri, and that this is the* limit of reckoning…

Numerical notations

The Hindus use the numeral signs in arithmetic in the same way as we do. I have composed a treatise showing how far possibly, the Hindus are ahead of us in this subject. Hindus compose their books in Slokas. If, now, they wish, in their astronomical handbooks, to express some numbers of the various *orders,* they express them by words used to denote certain numbers either in one *order* alone or at the same time in two *orders (e.g.* a word meaning either 20 or both 20 and 200). For each number they have appropriated quite a great quantity of words. Hence, if one word does not suit the metre, you may easily exchange it for a synonym which suits. Brahmagupta says; "If you want to write *one,* express it by everything which is unique, as *the earth, the moon; two* by everything which is double, as, *e.g. black* and *white, three* by everything which is threefold; the *nought* by *heaven,* the *twelve* by the names of the sun."…

4. The book, *Kyun yu Chun*, written in A.D. 1075 in Korea, points to the similarity of the Yi-do script with Sanskrit[4]

The Yi-do resembles the Sanskrit in its inflections.

5. Write on leaves, John of Monte Corvino[5]

They have indeed an alphabet which they use to keep their accounts, and to write prayers or charms for their idols; albeit they have no paper, but write upon leaves of trees like unto palm leaves.

6. Write perpendicularly, Nicolo Conti[6]

The inhabitants of Cambay alone use paper; all other Indians write on the leaves of trees, of which they make very beautiful books.

7. Art of writing, Abder Razzak[7]

The writing of this people is of two kinds: in one they write their letters with a kalam of iron upon a leaf of the Indian nut (the cocoa-nut tree), which is two *ghez* in length and two fingers in breadth. These characters have no colour, and the writing lasts but a short time. In the second kind of writing they blacken a white surface, they then take a soft stone, which they cut like a kalam, and which they use to form the letters; this stone leaves on the black surface a white colour, which lasts a very long time, and this kind of writing is held in high estimation.

8. Language in Bengal, Ma Huan[8]

[Bengali was] the language in universal use…[The Bengalis'] paper is white; it is made out of the bark of a tree, and is as smooth and glossy as deer's skin.

B. Literature

1. Grammatical and metrical literature, Alberuni[9]

The two sciences of grammar and metrics are auxiliary to the other sciences. of the two, the former, grammar, holds the first place in their estimate, called *vyakarana, i.e.* the law of the correctness of their speech and etymological rules, by means of which they acquire an eloquent and classical style both in writing and reading. We Muslims cannot learn anything of it, since it is a branch coming from a root which is not within our grasp – l mean the language itself…

Chhanda

Grammar is followed by another science, called *Chandas, i.e.* the metrical form of poetry, corresponding our metrics – a science indispensable to them, since all their books are in verse. By composing their books in metres they intend to facilitate their being learned by heart, and to prevent people in all questions of science ever recurring to a *written* text, save in a case of bare necessity. For they think that the mind of man sympathizes with everything in which there is symmetry and order, and has an aversion to everything in which there is no order. Therefore most Hindus are passionately fond of their verses, and always desirous of reciting them, even if they do not understand the meaning of the words, and the audience will snap their fingers in token of joy and applause. They do not want prose compositions, although it is much easier to understand them….

RELIGIOUS LITERATURE

2. The Vedas, Puranas, and other works, Alberuni[10]

Veda means knowledge of that which was before unknown. It is a religious system which, according to the Hindus, comes from God, and was promulgated by the mouth of Brahman. The Brahmins recite the Veda without understanding its meaning and in the same way they learn it by heart, the one receiving it from the other. Only few of them learn its

explanation, and still less is the number of those who master the contents of the Veda and their interpretation to such a degree as to be able to hold a theological disputation…

The Veda contains commandments and prohibitions, detailed statements about reward and punishment intended to encourage and to deter; but most of it contains hymns of praise, and treats of the various kinds of sacrifices to the fire, which are so numerous and difficult that you could hardly count them.

They do not allow the Veda to be committed to writing, because it is recited according to certain modulations, and they therefore avoid the use of the pen, since it is liable to cause some error, and may occasion an addition or a defect in the written text. In consequence it has happened that they have several times forgotten the Veda and lost it. For they maintain that the following passage occurs in the conversations between God and Brahman relating to the beginning of all things, according to the report of Saunaka who had received it from the planet Venus: "You will forget the Veda at the time when the earth will be submerged; it will then go down to the depths of the earth, and none but the fish will be able to bring it out again. Therefore I shall send the fish, and it will deliver the Veda into your hands. And I shall send the boar to raise the earth with its tusks and to bring it out of the water."

Further, the Hindus maintain that the Veda, together with all the rites of their religion and country, had been obliterated in the last Dvapara-yuga,… until it was renewed by Vyasa, the son of Parasara.

The *Vishnu Purana* says: "At the beginning of each Manvantara period there will be created anew a lord of a period whose children will rule over the whole earth, and a prince who will be the head of the world, and angels to whom men will bring fire-offerings, and the *Great Bear,* who will renew the Veda which is lost at the end of each period."

This is the reason why, not long before our time, Vasukra, a native of Kashmir, a famous Brahmin, has of his own account undertaken the task of explaining the Veda and committing it to writing. He has taken on himself a task from which everybody else would have recoiled, but he carried it out because he was afraid that the Veda might be forgotten and entirely vanish out of the memories of men, since he observed that the characters of men

grew worse and worse, and that they did not care much for virtue, nor even for duty…

As we have already mentioned, the books of the Hindus are metrical compositions like the Rajaz poems of the Arabs. Most of them are composed in a metre called *sloka.* The reason…being that a prose text is much more exposed to corruption than a metrical one...

According to their tradition, Vyasa divided it into four parts: R*igveda, Yajurveda, Samaveda,* and *Atharvaveda.*

Vyasa had four *sishya, i.e.* pupils. He taught a separate Veda to each of them, and made him carry it in his memory. They are enumerated in the same order as the four parts of the Veda: *Paila, Vaisampayana, Jaimini, Sumantu*.

The Rigveda

Each of the four parts has a peculiar kind of recitation. The first is Rigveda, consisting of metrical compositions called *ric,* which are of different lengths. It is called Rigveda as being the totality of the *ric.* It treats of the sacrifices to the fire, and is recited in three different ways. First, in a uniform manner of reading, just as every other book is read. Secondly, in such a way that a pause is made after every single word. Thirdly, in a method which is the most meritorious, and for which plenty of reward in heaven is promised. First you read a short passage, each word of which is distinctly pronounced; then you repeat it together with a part of that which has not yet been recited. Next you recite the added portion alone, and then you repeat it together with the next part of that which has not yet been recited. Continuing to do so till the end, you will have read the whole text twice.

The Yajurveda

The Yajurveda is composed of *kandin.* The word is a derivative noun, and means *the totality of the kandin.* The difference between this and the Rigveda is that it may be read as a text connected by the rules of Samdhi, which is not allowed in the case of Rigveda. The one as well as the other treats of works connected with the fire and the sacrifices…

The Samaveda

The Samaveda treats of the sacrifices, commandments, and prohibitions. It is recited in a tone like a chant, and hence its name is derived, because *saman* means *the sweetness of recitation.* The cause of this kind of recital is that Narayana, when he appeared on earth in the shape of Vamana, and came to the king Bali, changed himself into a Brahman and began to recite the Samaveda with a touching melody, by which he exhilarated the king, in consequence of which there happened to him the well-known story.

The Atharvanaveda

The Atharvanaveda is as a text connected by the rules of Samdhi. It does not consist of the same compositions as the Rig and Yajur Vedas, but of a third kind called *bhara.* It is recited according to a melody with a nasal tone. This Veda is less in favour with the Hindus than the others. It likewise treats of the sacrifices to the fire, and contains injunctions regarding the dead and what is to be done with them.

The Puranas

As to the Puranas, we first mention that the word means *first, eternal.* There are eighteen Puranas, most of them called by the names of animals, human or angelic beings, because they contain stories about them, or because the contents of the book refer in some way to them, or because the book consists of answers which the creature whose name forms the title of the book has given to certain questions. The Puranas are of human origin, composed by the so-called Rishis…

The Smriti

The book *Smriti* is derived from the Veda. It contains commandments and prohibitions, and is composed by…twenty sons of Brahman…

Other texts

Besides, the Hindus have books about the jurisprudence of their religion, on theosophy, on ascetics, on the process of becoming god and seeking liberation from the world, as, *e.g.* the book composed by Gauda the anchorite, which goes by his name; the book *Samkhya,* composed by Kapila, on divine subjects; the book of *Patanjali,* on the search for liberation and for the union of the soul with the object of its meditation; the book *Nyayabhasha,* composed by Kapila, on the Veda and its interpretation, also showing that it has been created, and distinguishing within the Veda

between such injunctions as are obligatory only in certain cases, and those which are obligatory in general; further, the book *Mimamsa,* composed by Jaimini, on the same subject; the book *Laukayata,* composed by Brihaspati, treating of the subject that in all investigations we must exclusively rely upon the apperception of the senses; the book *Agastyamata,* composed by Agastya, treating of the subject that in all investigations we must use the apperception of the senses as well as tradition; and the book *Vishnu-dharma.* The word *dharma* means *reward,* but in general it is used for *religion;* so that this title means *The religion of God,* who in this case is understood to be Narayana. Further, there are the books of the six pupils of Vyasa, viz. *Devala, Sukra, Bhargava, Vrihaspati, Yajavalkya,* and *Manu.* The Hindus have numerous books about all the branches of science. How could anybody know the titles of all of them, more especially if he is not a Hindu, but a foreigner?

The Mahabharata

Besides, they have a book which they hold in such veneration that they firmly assert that everything which occurs in other books is found also in this book, but not all which occurs in this book is found in other books. It is called *Bharata,* and composed by Vyasa, the son of Parasara at the time of the great war between the children of Pandu and those of Kuru. The title itself gives an indication of those times. The book has 100,000 slokas in eighteen parts, each of which is called *Parvan*...

These eighteen parts are followed by another one which is called *Harivamsa-Parvan,* which contains the traditions relating to Vasudeva.

In this book there occur passages which, like riddles, admit of manifold interpretations. As to the reason of this the Hindus relate the following story – Vyasa asked Brahman to procure him somebody who might write for him the *Bharata* from his dictation. Now he intrusted with this task his son Vinayaka, who is represented as an idol with an elephant's head, and made it obligatory on him never to cease from writing. At the same time Vyasa made it obligatory on him to write only that which he understood. Therefore Vyasa, in the course of his dictation, dictated such sentences as compelled the writer to ponder over them, and thereby Vyasa gained time for resting awhile.

C. Science

INDIAN NUMERALS

1. It is generally believed that Indian numerals with place value were introduced to the West about A.D. 773, when an Indian pandit, Kankah, brought the astronomical *Sindhind* to the court of al-Mansur at Baghdad. However, a passage from the Syrian writer Severus Sebokt [A.D. 662] provides the earliest known reference to Indian numerals outside India[11]

The subtle discoveries of the Hindus in astronomy, discoveries which are more ingenious than those of the Greeks and the Babylonians, and their clever method of calculation, their computation which surpasses words, I mean that which is made with nine signs…[The reference to nine signs does not necessarily prove the absence of zero. Till the sixteenth century, a distinction was maintained between the nine signs and zero].

2. Al-Khwarizmi [died A.D. 850] wrote a book on the Indian method of reckoning which formed the basis of Arabic mathematics for several centuries. Rabbi Ben Ezra [b. 1095] remarked on al-Khwarizmi's use of Hindu methods[12]

[al-Khwarizmi] and all later Arabic scholars do their multiplications, divisions, and extraction of roots as is written in the book of the (Hindu) scholar which they possess in translation.

3. Literature on sciences, Alberuni[13]

ASTRONOMY

If a science or an idea has once conquered the whole earth, every nation appropriates part of it. So do also the Hindus. Their belief about the cyclical revolutions of times is nothing very special, but is simply in accordance with the results of scientific observation.

The science of astronomy is the most famous among them, since the affairs of their religion are in various ways connected with it. If a man wants to gain the title of an astronomer, he must not only know scientific or mathematical astronomy, but also astrology. The book known among Muslims as *Sindhind* is called by them *Siddhanta, i.e. straight,* not crooked

nor changing. By this name they call every standard book on astronomy, even such books as, according to our opinion, do not come up to the mark of our so-called *Zij, i.e.* handbooks of mathematical astronomy. They have five Siddhantas :-

I. *Surya-siddhanta, i.e.* the Siddhanta of the sun, composed by Lata.

II. *Vasisha-siddhanta,* so called from one of the stars of the Great Bear, composed by Vishnucandra.

III. *Pulisa-siddhanta,* so called from Paulisa, the Greek, from the city of Saintra, which I suppose to be Alexandria, composed by Pulisa.

IV. *Romaka-siddhanta,* so called from the Rum, *i.e.* the subject of the Roman Empire, composed by Srishena.

V. *Brahma-siddhanta,* so called from Brahman, composed by Brahmagupta, the son of Jishnu, from the town of Bhillamala between Multan and Anhilwara, 16 *yojana* from the latter place (?).

The authors of these books draw from one and the same source, the Book *Paithamaha,* so called from *the first father, i.e.* Brahman.

Varhamihira has composed an astronomical hand-book of small compass called *Panca-siddhantika,* which name ought to mean that it contains the pith and marrow of the preceding five Siddhantas. But this is not the case, nor is it so much better than they as to called the most correct one of the five. So the name does not indicate anything but the fact that the number of Siddhantas is five.

Brahmagupta says: “Many of the Siddhantas are Surya, others Indu, Pulisa, Romaka, Vasishtha, and Yavana, *i.e.* the Greeks; and though the Siddhantas are many, they differ only in words, not in the subject-matter. He who studies them properly will find that they agree with each other.”

Up to the present time I have not been able to procure any of these books, save those of Pulisa, and of Brahmagupta. I have commenced translating them, but have not yet finished my work…

Tantra

Such books as do not reach the standard of a Siddhanta are mostly called *Tantra* or *Karana.* The former means *ruling under a governor,* the latter means *following, i.e.* following behind the Siddhanta. Under *governors* they understand the *Acaryas,* the sages, anchorites, the followers of Brahman.

There are two famous *Tantras* by *Aryabhata* and *Balabhadra,* besides the *Rasayana-tantra* by *Bhanu-yasas* (?)...

As for *Karanas,* there is one *(lacuna)* called by his name, besides the *Karana-khanda-khadyaka* by Brahmagupta…

Samhita

Samhita, means *that which is collected,* books containing something of everything, *e.g.* forewarnings relating to a journey derived from meteorological occurrences; prophecies regarding the fate of dynasties; the knowledge of lucky and unlucky things; prophesying from the lines of the hand; interpretation of dreams, and taking auguries from the flight or cries of birds. For Hindu scholars believe in such things. It is the custom of their astronomers to propound in their Samhitas also the whole science of meteorology and cosmology.

Jatakas

Each one of the following authors has composed a book, *Jataka, i.e.* book of nativities, viz.:-

Parasara, Jivasarman, Satya, Mau, the Greek, Manittha,

Varahamihira has composed two Jatakas, a small and a large one. The latter of these has been explained by Balabhadra, and the former I have translated into Arabic. Further, the Hindus have a large book on the science of the astrology of nativities called *Saravali, i.e.* the chosen one, similar to the *Vazidaj* (= Persian *guzida*?), composed by Kalyana-Varman, who gained high credit for his scientific works. But there is another book still larger than this, which comprehends the whole of astrological sciences, called *Yavana, i.e.* belonging to the Greeks.

Of Varahamihira there are several small books, *e.g. Shatpancasika,* fifty-six chapters on astrology; *Hora-panca-hotriya* (?), on the same subject.

Travelling is treated of in the book *Yogayatra* and the book *Tikani(?)-yatra,* marriage and marrying in the book *Vivaha-patala,* architecture in the book *(lacuna)...*

Medicine

Medicine belongs to the same class of sciences as astronomy, but there is this difference, that the latter stands in close relation to the religion of the Hindus. They have a book called by the name of its author, *i,e. Caraka,*

which they consider as the best of their whole literature on medicine. According to their belief, Caraka was a Rishi in the last Dvapara-yuga, when his name was *Agnivesa,* but afterwards he was called *Caraka, i.e,* the intelligent one, after the first elements of medicine had been laid down by certain Rishis, the children of *Sutra.* These latter had received them from Indra, Indra from Asvin, one of the two physicians of the Devas, and Asvin had received them from Praja-pati, *i.e,* Brahman, *the first father.* This book has been translated into Arabic for the princes of the house of the Barmecides.

The Panchatantra

The Hindus cultivate numerous other branches of science and literature, and have a nearly boundless literature. I, however, could not comprehend it with my knowledge. I wish I could translate the book *Pancatantra,* known among us as the book of Kalila and Dimna. It is far spread in various languages, in Persian, Hindi, and Arabic – in translations of people who are not free from the suspicion of having altered the text…

4. Science of Rasayana, Alberuni[14]

They have a science similar to alchemy which is quite peculiar to them. They call it *Rasayana,* a word composed with *rasa, i.e.* gold. It means an art which is restricted to certain operations, drugs, and compound medicines, most of which are taken from plants. Its principles restore the health of those who were ill beyond hope, and give back youth to fading old age, so that people become again what they were in the age near puberty; white hair becomes black again, the keenness of the senses is restored as well as the capacity for juvenile agility, and even for cohabitation, and the life of people in this world is even extended to a long period. And why not? Have we not already mentioned on the authority of Patanjali…that one of the methods leading to liberation is *Rasayana?* What man would hear this, being inclined to take it for truth, and not dart off into foolish joy and not honour the master of such a wonderful art by popping the choicest bit of his meal into his mouth?

A famous representative of this art was Nagarjuna, a native of the fort Daihak, near Somanath. He excelled in it, and composed a book which contains the substance of the whole literature on this subject, and is very rare. He lived nearly a hundred years before our time…

5. The zodiac, Alberuni[15]

We have already mentioned, near the beginning of the book, that the language of the Hindus is extremely rich in nouns, both original and derivative, so that in some instances they call *one* thing by a multitude of different names. So I have heard them saying that they have a thousand names all meaning *sun;* and, no doubt, each planet has quite as many, or nearly as many names, since they could not do with less (for the purposes of versification).

The names of the weekdays are the best known. The names of the planets connected with the word *bara,* which follows after the planet's name, as in Persian the word *shambih* follows after the number of the weekday *(dushambih, sihshambih,* & c), So they say :

Aditya bara, i.e. Sunday.
Soma bara, i.e. Monday.
Mangala bara, i.e. Tuesday.
Budha bara, i.e, Wednesday.
Brihaspati bara, i.e. Thursday.
Sukra bara, i.e. Friday.
Sanaiscara bara, i.e. Saturday.

And thus they go on counting, beginning anew with Sunday, Monday, & c…

The Greeks mark the planets with figures, to fix by their limits on the *astrolabe* in an easily intelligible manner, images which are not letters of the alphabet. The Hindus use a similar system of abridgement; however, their figures are not images invented for the purpose, but the initial characters of the names of the planets, e.g. *a* = *Aditya,* or the Sun; *c* = *Candra,* or the Moon; b = *Budha,* or Mercury…

The names of the months are related to those of the lunar stations. As two or three stations belong to each month, the name of the month is derived from one of them.

The signs of the zodiac have names corresponding to the images which they represent, and which are the same among the Hindus as among all other nations. The third sign is called *Mithuna,* which means a pair consisting of a boy and a girl; in fact, the same as *the Twins,* the well-known image of this sign…

6. Hindu calendar, Nicolo Conti[16]

They divide the year into twelve months, which they name after the signs of the zodiac. The area is computed variously. The greater part date its commencement from Octavian, in whose time there was peace all over the world. But they call 1,400, 1,490.

7. Traditions relating to the Poles, Alberuni[17]

The pole, in the language of the Hindus, is called *dhruva* and the axis *salaka*. The Hindus, with the exception to their astronomers, speak always only *one* pole, the reason of which is their belief in *the dome of heaven,* as we have heretofore explained. According to *Vayu-Purana,* heaven revolves round the pole like a potter's wheel, and the pole revolves round itself, without changing its own place. This revolution is finished in 30 *muhurta, i.e.* in one *nychthemeron...*

8. The accomplishments of the people [*adab*], Gardizi[18]

Their sciences and accomplishments are manifold. One of them is charms (*afsun*). It is reported that, should they be willing, they will what they wish. With their charms they heal, and, whatever limb it be, they expel illness from it and pass it over to some other person. Another accomplishment is telepathy (lit. 'imagination and thought'), and it is reported that by it they obtain wonders and address words to the absent by means of telepathy, and thus it happens. By persuasion and telepathy (*i'tqad-va-guman*) and show phantoms by which great sages are preplexed (reading *tahayyur* for *tamiz*). They also have a procedure called *simaband* (spelt *sh.mat.nt*) which refers to the wonderful talismans which they make. They recite incantations (*khwanish* 'hymns'?) tantamount to talismans and they impart these incantations to their disciples. of these incantations one particularly astonishing is (that) stopping hail (*ihala*), which they chase from one place to another. And thus they make contracts with villages and other places for protecting them against hail. They make contracts from year to year, and, should someone refrain, they will send hail against his land.

Another incantation (*khwanish*) is against snake-poison, which they remove from a man's body. Hamd ibn valak (?) GARDIZI told me that a man was bitten by a snake; thereupon (*bar jay*) he grew old and became like a corpse and they wanted to bury him. Meanwhile, an Indian came up and said: "he has fainted but has not died". He then kept reciting a spell

(*afsum bi-khwandan istad*) and that man recovered his senses. (The Indian) brought out the poison from where the snake bit him and the man got up and walked away.

And they produce many similar wonders, by means of reciting spells (*afsun khwandan*). And they have a medical science the like of which no one has seen in the lands of Islam. Their claims in it are numerous, such as to maintain health, to avert illness, to put off senility, to increase sexual power, and besides, to restrain (*baz-dashtan*) inveterate ailments – such as some of our friends have witnessed ourselves have heard.

(Among) the wonders (are their) mathematics, geodesy, geometry, and astronomy, in which their science and authority (*sangi ?*) have reached a degree which it is impossible to explain for it is superhuman.

9. Science denominated physiognomy, Marco Polo[19]

In this country there are many adepts in the science denominated physiognomy, which teaches the knowledge of the nature and qualities of men, and whether they tend to good or evil. These qualities are immediately discerned upon the appearance of the man or woman. They also know what events are portended by meeting certain beasts or birds. More attention is paid by these people to the flight of birds than by any others in the world, and from thence they predict good or bad fortune. In every day of the week there is one hour which they regard as unlucky, and this they name *choiach;* thus, for example, on Monday the (canonical) hour of *mi-tierce,* on Tuesday the hour of *tierce,* on Wednesday the hour of *none;* and on these hours they do not make purchases, nor transact any kind of business, being persuaded that it would not be attended with success. In like manner they ascertain the qualities of every day throughout the year, which are described and noted in their books. They judge of the hour of the day by the length of a man's shadow when he stands erect. When an infant is born, be it a boy or a girl, the father or the mother makes a memorandum in writing of the day of the week on which the birth took place; also of the age of the moon, the name of the month, and the hour. This is done because every future act of their lives is regulated by astrology.

D. Legal system

1. Test of fire, *Akhbar Al-Sin wa'l Hind,* An Account of China and India[20]

In India if a person makes a claim against another person in which capital punishment is necessary, the plaintiff is asked: 'Will you endure [the test of] fire?' When he says 'yes', then a piece of iron is heated to such an intensity that it becomes incandescent (lit. the fire appears in it). Then he is asked: 'Spread out your hand.' Then seven leaves of a tree found there are placed on his hand. Then the [hot] piece of iron is placed over the leaf. He then walks with it forwards and backwards until he drops it. Then a leather bag is fetched and his hand is put inside it. It is sealed with the royal seal. After three days, unpeeled rice is brought and he is asked to remove the husk from it. If this has no effect on his hand, he succeeds, and there is no death sentence against him, and the accused is compelled to pay a fine of one maund of gold which the Sultan appropriates for himself. Sometimes they boil water in an urn of iron or copper to such a degree that no one can even go near it. Then they cast an iron ring in it, and he [the plaintiff] is asked to put his hand inside it and to take the ring out. I have seen a person putting his hand in it and then taking it out unhurt [lit. healthy]. In this case also, the plaintiff has to pay one maund of gold.

2. Administer justice without arbiter, Al-Idrisi[21]

[The Indians] administer justice among themselves without any recourse to a judge or an arbitrator. They do all this naturally, by force of habit and character in which they are brought up and to which they are accustomed.

3. Justice in Chola kingdom, Chau Ju-Kua[22]

When anyone among the people is guilty of an offence one of the Court Ministers punishes him; if the offence is light, the culprit is tied to a wooden frame and given fifty, seventy, or up to an hundred blows with a stick. Heinous crimes are punished with decapitation or by being trampled to death by an elephant.

4. Crime and punishment, sati, Marco Polo[23]

The following extraordinary custom prevails at this place. When a man who has committed a crime, for which he has been tried and condemned to suffer death, upon being led to execution, declares his willingness to sacrifice himself in honour of some particular idol, his relations and friends

immediately place him in a kind of chair, and deliver to him twelve knives of good temper and well sharpened. In this manner they carry him about the city, proclaiming, with a loud voice, that this brave man is about to devote himself to a voluntary death, from motives of zeal for the worship of the idol. Upon reaching the place where the sentence of the law would have been executed, he snatches up two of the knives, and crying out, "I devote myself to death in honour of such an idol," hastily strikes one of them into each thigh, then one into each arm, two into the belly, and two into the breast. Having in this manner thrust all the knives but one into different parts of his body, repeating at every wound the words that have been mentioned, he plunges the last of them into his heart, and immediately expires. As soon as this scene has been acted, his relations proceed, with great triumph and rejoicing, to burn the body; and his wife, from motives of pious regard for her husband, throws herself upon the pile, and is consumed with him. Women who display this resolution are much applauded by the community, as, on the other hand, those who shrink from it are despised and reviled.

5. Payment of debt, Marco Polo[24]

Offences in this country are punished with strict and exemplary justice, and with regard to debtors the following customs prevail. If application for payment shall have been repeatedly made by a creditor, and the debtor puts him off from time to time with fallacious promises, the former may attach his person by drawing a circle round him, from whence he dare not depart until he has satisfied his creditor, either by payment, or by giving adequate security. Should he attempt to make his escape, he renders himself liable to the punishment of death, as a violator of the rules of justice. Messer Marco, when he was in this country on his return homeward, happened to be an eyewitness of a remarkable transaction of this nature. The king was indebted in a sum of money to a certain foreign merchant, and although frequently importuned for payment, amused him for a long time with vain assurances. One day when the king was riding on horse-back, the merchant took the opportunity of inscribing a circle round him and his horse. As soon as the king perceived what had been done, he immediately ceased to proceed, nor did he move from the spot until the demand of the merchant was fully satisfied. The bystanders beheld what passed with admiration, and

pronounced that king to merit the title of most just, who himself submitted to the laws of justice.

6. Oaths allowed, Nicolo Conti[25]

In criminal charges oaths are allowed, where there is no witness to prove the offence. There are three modes of swearing. In one, the person to whom the oath is administered stands before the idol, and swears by the idol that he is innocent. Having taken the oath, he then licks with his tongue a piece of iron, such as a mattock, red hot; if he escape uninjured he is declared innocent. Others again, having first taken the oath, carry the same piece of iron, or a red hot iron plate for several paces before the idol; if burnt in any part he is punished as guilty, if he escape unhurt he is exempt from the punishment awarded for the offence. There is a third manner of swearing, and this is the most common of all. A vessel is placed before the idol filled with boiling butter. He who swears that he is innocent of the offence charged against him, plunges two fingers into the butter, which are immediately wrapped up in linen and a seal impressed upon it, to prevent the covering being removed. On the third day the bandage is taken off. If any injury appear upon the fingers the accused is punished; if no injury present itself he is released.

7. Trial by ordeal at Calicut, Ma Huan[26]

Trial by ordeal is much practiced in this country, such as thrusting the finger of the accused into boiling oil, and then keeping him in jail for two or three days. If after that time the finger is ulcerated he is pronounced guilty and sentenced to punishment; but if his finger has received no injury he is at once set free, and escorted home by musicians engaged by the overseer. On his arrival home his relatives, neighbours, and friends make him presents and rejoice and feast together.

CHAPTER — 4

State of Economy

A. Some important cities and ports
B. Ships and navigation
C. Pearl fishery
D. Communications
E. Artisans
F. Weights and measures
G. Currency
H. Prices and markets

A. Some important cities and ports

1. Multan, Ibn Khurdadhbih[1]

Al-Multan was named 'Frontier-place of the House of Gold' (*Farj Bayt al-Dhahab*), because Muhammad b. al-Qasim, the lieutenant of Hajjaj b. Yusuf, had obtained forty *bhar* of gold from a house there. One *bhar* is equal to three hundred and thirty-three *mann.* It was for this reason that the town was named 'Frontier-place of the House of Gold'. [The word] *al-farj* is synonymous with *al-thaghr* [frontier]. The quantity of the gold obtained was 2,37,600 *mithqal*…From al-Sind costus, qana and al-khayzuran (bamboos) are imported.

2. Muslims enriched by gold of Multan, Ibn Haukal[2]

The reason why Multan is designated "the boundary of the house of gold" is, that the Muhammadans, though poor at the time they conquered the place, enriched themselves by the gold which they found in it.

3. Multan, *Subh-ul-A'sha*[3]

It is situated in the third of the seven climates…It has been mentioned in *Masalik ul-Absar* on the authority of some works that the villages of Multan are 126,000.

4. Aror [Azur], *Subh-ul-A'sha*[4]

Aror: The author of *Al-Azizi* says, it is a big city and its inhabitants are Muslims who are under the rule of the Governor of Mansura.

5. Mansura [old Brahmanabad, Sind], Al-Idrisi[5]

Mansura occupies a space of a mile square. The climate is hot. The country produces dates and sugar canes in abundance. There are hardly any other fruits, if we except one, a sort of fruit called laimun, as big as an apple and of a very sour taste, and another which resembles the peach both in shape and taste. Mansura was built at the beginning of the reign of Al Mansur; of the Abbaside family. This prince gave his name ('the victorious') to four different cities, as a good augury that they might stand forever. The first was Baghdad in 'Irak; the second, Mansura in Sind; the third, Al Masisa, on the Mediterranean; the fourth, that of Mesopotamia. That of which we are now speaking is great, populous, rich, and commercial. Its environs are fertile. The buildings are constructed of bricks, tiles, and plaster. It is a place of recreation and of pleasure. Trade flourishes. The bazaars are filled with people, and well stocked with goods. The lower classes wear the Persian costume, but the princes wear tunics, and allow their hair to grow long like the princes of India. The money is silver and copper. The weight of the drachma (dinar) is five times that of the (ordinary) drachma. The Tatariya coins also are current here. Fish is plentiful, meat is cheap, and foreign and native fruits abound. The name of this city in Indian is Mirman. It is considered one of the dependencies of Sind, like Debal, Nirun, Bania, Kalari, Atri, Sharusan, Jandaur, Manhabari [Manjabari], Basmak and Multan.

6. Debal [a famous seaport of Sind on the site of modern Karachi, named after a Buddhist temple *devalya*, destroyed by Muslims in 711 A.D.], Al-Idrisi [6]

This is a populous place, but its soil is not fertile, and it produces scarcely any trees except the date-palm. The highlands are arid and the plains sterile. Houses are built of clay and wood, but the place is inhabited only because it is a station for the vessels of Sind and other countries. Trade is carried on in a great variety of articles, and is conducted with much intelligence. Ships laden with the production of Uman, and the vessels of China and India come to Debal. They bring stuffs and other goods from China, and the perfumes and aromatics of India. The inhabitants of Debal, who are generally rich, buy these goods in the bulk, and store them until the vessels are gone and they become scarce. Then they begin to sell, and go trading

into the country, putting their money out on interest, or employing it as may seem best.

7. Nirun [the old name of modern Haidarabad, Sind], *Subh-ul-A'sha*[7]

Nirun: The author of *Al-Lubab* says, "it is a city in the district of Daybul between the latter and Mansura and situated in the second of the seven climates."…

Ibn Said says, "it is one of the ports of the country of Sind and on which their saltish bay lies that comes out of the Persian Sea. The author of *AI Azizi* says, "its inhabitants are Muslims. Ibn Hauqal says, "it is a fertile place with abundant wealth and big bazars; around it there are many towns and markets.

8. Makran, *Subh-ul-A'sha* [8]

Ibn Hauqal says, "it is a broad and extensive region; consisting mostly of deserts and barren and arid plains."…Its capital is Tiz. It is situated in the second of the seven climates…Ibn Hauqal says, "it is the seaport of Mukran and those districts."

9. Lahari, south-east of Karachi [ruins of Debal?], Ibn Battuta [9]

After five days' travelling we reached 'Ala al-Mulk's province, Lahari, a fine town on the coast where the river of Sind discharges itself into the ocean. It possesses a large harbour, visited by men from Yemen, Fars, and elsewhere. For this reason its contributions to the Treasury and its revenues are considerable; the governor told me that the revenue from this town amounted to sixty lakhs per annum. The governor receives a twentieth part of this, that being the footing on which the sultan commits the provinces to his governors. I rode out one day with 'Ala al-Mulk, and we came to a plain called Tarna, seven miles from Lahari, where I saw an innumerable quantity of stones in the shape of men and animals. Many of them were disfigured and their forms effaced, but there remained a head or a foot or something of the sort. Some of the stones also had the shape of grains of wheat, chickpeas, beans and lentils, and there were remains of a city wall and house walls. We too saw the ruins of a house with a chamber of hewn stones, in the midst of which there was a platform of hewn stones resembling a single block, surmounted by a human figure, except that its head was elongated and its mouth on the side of its face and its hands

behind its back like a pinioned captive. The place had pools of stinking water and an inscription on one of its walls in Indian characters. ‘Ala al-Mulk told me that the historians relate that in this place there was a great city whose inhabitants were so depraved that they were turned to stone, and that it is their king who is on the terrace in the house, which is still called ‘the king’s palace.’ They add that the inscription gives the date of the destruction of the people of that city, which occurred about a thousand years ago.

10. Bakar and Uch, Ibn Battuta[10]

Bakar [is] a fine city intersected by a channel from the river of Sind. Thereafter I travelled from Bakar to the large town of Uja [Uch] which lies on the bank of the river and has fine bazaars and buildings.

11. Abohar first town after Multan, Ibn Battuta[11]

The first town we reached after leaving Multan was Abuhar [Abohar] which is the first town in India proper, and thence we entered a plain extending for a day’s journey.

12. Sirsa, Ibn Battuta[12]

Let us return to our original topic. We set out from the town of Ajudahan, and after four days’ march reached Sarasati [Sarsuti or Sirsa], a large town with quantities of rice of an excellent sort which is exported to the capital Delhi.

13. Kambay, Al-Idrisi[13]

Kambaya stands three miles from the sea, and is very pretty. It is well known as a naval station. Merchandise from every country is found here, and is sent on from hence to other countries. It is placed at the extremity of a bay, where vessels can enter and cast anchor. It is well supplied with water, and there is a fine fortress erected by the government of India to prevent the inroads of the inhabitants of the island of Kish. From Kambaya to the isle of Aubkin, two-and-a-half days’ sail. From Aubkin to Debal, two days. Kambaya is fertile in wheat and rice. Its mountains produce the Indian kana. The inhabitants are idolaters.

14. Of the kingdom of Kambaia [Cambay], Marco Polo[14]

This also is an extensive kingdom, situated towards west, governed by its own king, who pays no tribute to any other, and having its proper language.

The people are idolaters. In this country the north-star is seen still higher than in any of the preceding, in consequence of its lying further to the north-west. The trade carried on is very considerable, and a great quantity of indigo is manufactured. There is abundance of cotton cloth, as well as of cotton in the wool. Many skins well dressed are exported from hence, and the returns are received in gold, silver, copper, and tutty.

15. Cambay, Ibn Battuta[15]

Thereafter we travelled to the town of Kinbaya [Cambay], which is situated on an arm of the sea resembling a river; it is navigable for ships and its waters ebb and flow. I myself saw the ships there lying on the mud at ebb-tide and floating on the water at high tide. This city is one of the finest there is in regard to the excellence of its construction and the architecture of its mosques. The reason is that the majority of its inhabitants are foreign merchants, who are always building fine mansions and magnificent mosques and vie with one another in doing so.

16. Cambay, Nicolo Conti[16]

Cambay is situated near to the sea, and is twelve miles in circuit; it abounds in spikenard, lac, indigo, myrobalans, and silks.

17. Cambay, Athanasius Nikitin[17]

Cambayat is a port of the whole Indian sea, and a manufacturing place for every sort of goods; as talach [long gowns], damask, khan [a sort of silk], kiota [blankets], and there they prepare the blue stone colour.

18. Subara [Sopara, near Bassein in Thana district], Al-Idrisi[18]

Subara is situated one-and-a-half mile from the sea. It is a populous, busy town, and is considered one of the entrepots of India. They fish for pearls here. It is in the vicinity of Bara, a small island, on which some cocoa-nut trees and the costus grow. From Subara to Sindan is considered five days.

19. Sindan [Sanjan, north of Thana, Bombay], Al-Idrisi[19]

Sindan is a mile-and-a-half from the sea. It is populous, and the people are noted for their industry and intelligence. They are rich and of a warlike temper. The town is large, and has an extensive commerce both in exports and imports. East of Sindan there is an island bearing the same name and dependent on India. It is large and well cultivated, and the cocoanut palm, kana, and rattan grow there.

20. Saimur [modern Chaul in Colaba district Bombay], Al-Idrisi[20]

Saimur, five days from Sindan, is a large well-built town. Cocoanut trees grow here in abundance; henna also grows here, and the mountains produce many aromatic plants, which are exported.

21. Saimur, Zakariya Al Kazwini[21]

Saimur – A city of Hind near the confines of Sind. The people are very beautiful and handsome, from being born of Turk and Indian parents. There are Musulmans, Christians, Jews, and Fire-worshippers there. The merchandize of the Turks is conveyed hither, and the aloes called Saimuri are named from this place. The temple of Saimur is an idol temple, on the summit of a high eminence, under the charge of keepers. There are idols in it of turquoise and baijadak, which are highly venerated. In the city there are mosques, Christian churches synagogues, and Fire temples. The infidels do not slaughter animals, nor do they eat flesh, fish, or eggs; but there are some who will eat animals that have fallen down precipices, or that have been gored to death, but they do not eat those that have died a natural death. This information has been derived from Mis'ar bin Muhalhil, author of the *Ajaibu-l buldan*, who travelled into various countries and recorded their wonders.

22. The island of Kish which marked the limit of the voyages of Indian merchants trading with Persia and the West, Rabbi Benjamin of Tudela[22]

[Kish is] a considerable market, being the point to which Indian merchants and those of the island bring their commodities; while the traders of Mesopotamia, Yemen and Persia import all sorts of silk and purple cloths, flax, cotton, hemp, mash (a kind of pea), wheat, barley, millet, rye and all sorts of comestibles and pulse, which articles form objects of exchange; those from India import great quantities of spices, and the inhabitants of the island live by what they gain in their capacity of brokers to both parties. The island contains about five hundred Jews.

23. Quilon, Rabbi Benjamin of Tudela[23]

They [The people of Quilon] are descendents of Khush, are addicted to astrology, and are all black. This nation is very trustworthy in matters of trade, and whenever foreign merchants enter their port, three secretaries of the king immediately repair on board their vessels, write down their names

and report them to him. The king thereupon grants them security for property, which they may even leave in the open fields without any guard.

One of the king's officers sits in the market, and receives goods that may have been found anywhere, and which he returns to those applicants who can minutely describe them. This custom is observed in the whole empire of the king.

From Easter to New Year (from April to October) during the whole of the summer the heat is extreme. From the third hour of the day (nine O'clock in the morning) people shut themselves up in their houses until the evening, at which time everybody goes out. The streets and markets are lighted up and the inhabitants employ all the night upon their business, which they are prevented from doing in the daytime, in consequence of the excessive heat.

24. Quilon, Rabbi Benjamin of Tudela[24]

…The pepper grows in this country; the trees which bear this fruit are planted in the fields, which surround the towns, and every one knows his plantation. The trees are small and the pepper is originally white, but when they collect it, they put it into basins and pour hot water upon it; it is then exposed to the heat of the sun and dried in order to make it hard and more substantial, in the course of which process it becomes of a black colour.

Cinnamon, ginger, and many other kinds of spices also grow in this country.

25. Quilon, Chau Ju-Kua[25]

Quilon may be reached in five days with the monsoon from Nanp'i. It takes a Ts'uan-chou ship over forty days to reach Lan-li (i.e., Lan-wu-li); there the winter is spent, and the following year, a further voyage of a month will take it to this country...

The native products comprise cocoanuts and sapan-wood; for wine they use a mixture of honey with cocoanuts and the juice of a flower; which they let ferment…

For the purpose of trade they use coins of gold and silver; twelve silver coins are worth one gold one. The country is warm and has no cold season. Every year ships come to this country from San-fo-ts'i, Kien-pi and Ki-t'o [all in Sumatra], and the articles they trade with are the same as in Nan-p'i.

"Great numbers of Ta-shi [Arabs] live in this country.

26. Of the kingdom of Koulam [Quilon], Marco Polo [26]

Upon leaving Maabar and proceeding five hundred miles towards the south-west, you arrive at the kingdom of Koulam. It is the residence of many Christians and Jews, who retain their proper language. The king is not tributary to any other. Much good sappan-wood grows there, and pepper in great abundance, being found both in the woody and the open parts of the country. It is gathered in the months of May, June, and July; and the vines which produce it are cultivated in plantations. Indigo also, of excellent quality and in large quantities, is made here. They procure it from an herbaceous plant, which is taken up by the roots and put into tubs of water, where it is suffered to remain till it rots; when they press out the juice. This, upon being exposed to the sun, and evaporated, leaves a kind of paste, which is cut into small pieces of the form in which we see it brought to us.

The heat during some months is so violent as to be scarcely supportable; yet the merchants resort thither from various parts of the world, such, for instance, as the kingdom of Manji and Arabia, attracted by the great profits they obtain both upon the merchandise they import, and upon their returning cargoes...

Wine is made from the sugar yielded by a species of palm. It is extremely good, and inebriates faster than the wine made from grapes. The inhabitants possess abundance of everything necessary for the food of man excepting grain, of which there is no other kind than rice; but of this the quantify is very great.

Among them are many astrologers and physicians, well versed in their art. All the people, both male and female, are black, and, with the exception of a small piece of cloth attached to the front of their bodies, they go quite naked. Their manners are extremely sensual, and they take as wives their relations by blood, their mothers-in-law, upon the death of their fathers, and the widows of their deceased brothers. But this, as I have been informed, is the state of morals in every part of India.

27. Quilon, Ibn Battuta[27]

On the tenth day we reached the city of Kawlam [Quilon], one of the finest towns in the Mulaybar-lands. It has fine bazaars, and its merchants are called Sulis. They are immensely wealthy; a single merchant will buy a vessel with all that is in it and load it with goods from his own house. There

is a colony of Muslim merchants; the cathedral mosque is a magnificent building, constructed by the merchant Khwaja Muhazzab. This city is the nearest of the Mulaybar towns to China and it is to it that most of the merchants [from China] come. Muslims are honoured and respected in it. The sultan of Kawlam is an infidel called the Tirawari; he respects the Muslims and has severe laws against thieves and profligates.

28. Tanjore – rice country, Ibn Khurdadhbih[28]

From there (Mulay) to Bullin [neighbourhood of Tanjore district], it is two days' journey [by sea], and from there to al-Lujjat al-Uzma (the Great Fathomless Sea) it is a journey of two days [by sea]. From Bullin the sea routes bifurcate. Thus, anyone sailing along the coast will take two days from Bullin to Babattan [Coromandel Coast]. This is the country of rice and is the source of provisions for the inhabitants of Sarandib.

29. Mali, Al-Idrisi[29]

Five miles by sea (from Kulam Mali) lies the island of Mali, which is large and pretty. It is an elevated plateau, but not very hilly, and is covered with vegetation. The pepper vine grows in this island, as in Kandarina and Jirbatan, but it is found nowhere else but in these three places. It is a shrub, having a trunk like that of the vine; the leaf is like the convolvulus, but longer; it bears grapes like those of the Shabuka, each bunch of which is sheltered by a leaf which curls over when the fruit is ripe. White pepper is what is gathered as it begins to ripen, or even before. Ibn Khurdadba states that the leaves curl over the bunches to protect them from the rain, and that they return to their natural position when the rain is over – a surprising fact!

Kambaya, Subara, Sindan, and Saimur form part of India. The last named belongs to a country whose king is called Balhara: his kingdom is vast, well-peopled, commercial, and fertile. It pays heavy taxes, so that the king is immensely rich. Many aromatics and perfumes are produced in this country.

30. Broach, Al-Idrisi[30]

Baruh [Bharuch, Broach] is a large handsome town, well-built of bricks and plaster. The inhabitants are rich and engaged in trade, and they freely enter upon speculations and distant expeditions. It is a port for the vessels coming from China, as it is also for those of Sind. From hence to Saimur is considered two days' journey, and to Nahrwara eight days through a flat

country where they travel in carriages on wheels. In all Nahrwara and its environs there is no other mode of travelling except in chariots drawn by oxen under the control of a driver. These carriages are fitted with harness and traces, and are used for the carriage of goods.

31. Tanna, Al-Idrisi[31]

Bana [Tanna] is a pretty town upon a great gulf where vessels anchor and from whence they set sail. In the neighbouring mountains the kana and tabashir grow. The roots of the kana which are gathered here are transported to the east and to the west. The tabashir is adulterated by mixing it with ivory cinders, but the real article is extracted from the roots of the reed called *sharki*...

32. The ancient city of Thana, Odoric of Pordenone[32]

The city is excellent in position, and hath great store of bread and wine, and aboundeth in trees. This was a great place in days of old, for it was the city of King Porus [it is difficult to say how Porus got associated with these parts; one speculation is that the Elephanta Caves situated nearby were attributed to Alexander by foreigners and Porus thus too was relocated here], who waged so great a battle with King Alexander. The people thereof are idolaters, for they worship fire, and serpents, and trees also. The land is under the dominion of the Saracens, who have taken it by force of arms, and they are now subject to the Empire of Dili.

33. Kandaria, Al-Idrisi [33]

From Bana [Tanna] to Fandarina is four days. Fandarina is a town built at the mouth of a river which comes from Manibar [Malabar] where vessels from India and Sind cast anchor. The inhabitants are rich, the markets well supplied, and trade flourishing. North of this town there is a very high mountain covered with trees, villages, and flocks. The cardamom grows here, and forms the staple of a considerable trade. It grows like the grains of hemp, and the grains are enclosed in pods. From Fandarina to Jirbatan, a populous town on a little river is five days. It is fertile in rice and grain, and supplies provisions to the markets of Sarandib. Pepper grows in the neighbouring mountains. From Jirbatan to Sanji and Kaikasar two days. These are maritime towns near to each other; the neighbourhood produces rice and corn. From hence to Kilkayan one day. From Kilkayan to Lulu and to Kanja one day. The vicinity is fertile in rice and wheat, and produces

sapan wood abundantly. The growth of this tree resembles that of the oleander. Cocoa nut trees abound. From Kanja to Samandar thirty miles.

34. Samandar [Sonargoan], Al-Idrisi[34]

Samandar is a large town, commercial, and rich, where there are good profits to be made. It is a port dependant upon Kanauj, king of this country. It stands upon a river, which comes from the country of Kashmir. Rice and various grains, especially excellent wheat, are to be obtained here. Aloe wood is brought hither from the country of Karmut [Kamrup?] 15 days' distance, by a river of which the waters are sweet. The aloe wood which comes from this country is of a superior quality and of a delicious perfume. It grows in the mountains of Karan.

35. Kanauj, Al-Idrisi[35]

[Kanauj] is a fine commercial city which gives its name to the king of the country. It is built upon the banks of a large river which falls into the Musala.

36. Kanauj, Ibn Battuta[36]

Thence we travelled to the river known as *Ab-i Siyah* ['Black Water,' Kalindi] and from there reached the city of Qinawj [Kanauj]. It is a large, well-built and strongly fortified city; prices there are cheap and sugar plentiful, and it is surrounded by a great wall.

37. Kandahar, Al-Idrisi [37]

Kandahar is a city built in the mountains of which we have just spoken, eight days journey from Moridas, and the road from one place to the other passes over the mountains. It is a considerable town, and well peopled. The inhabitants are remarkable for the manner in which they allow their beards to grow. Their beards are large and very thick, and hang down to their knees. This has given rise to a proverbial saying. They are stout in person, and wear the Turkish costume. The country produces wheat, rice, various grains, sheep, and oxen. They eat sheep, which have died a natural death, but not oxen, as we have already observed. From Kandahar to Nahrwara is five days' journey in carriages.

The people of Kandahar are often at war with those of Kabul, which is an Indian city, large and well built, bordering upon Tukharistan. The mountains produce excellent aloe wood, and the neighbourhood supplies

cocoa nuts and myrobolans, which grow in the hills, and of that sort which is called Kabuli, from this town. In the lowlands saffron is largely cultivated, and is the object of a large export trade. It is a hazardous crop, depending upon the state of the atmosphere. The city of Kandahar is defended by a very strong citadel built upon a scarped rock, and is accessible by one road only. It is inhabited by Musulmans, and there is a quarter in which the infidel Jews dwell. No king can take the title of Shah until he has been inaugurated at Kabul. According to an ancient law, the assumption of power must be made in that city; hence it is resorted to from foreign and very distant countries. In the fertile lands of Kabul a good deal of indigo is cultivated of the very best quality, it has a great repute, and is the object of a great trade. Cotton cloths are also made here, and are exported to China, Khurasan, and Sind. There are some well-known iron mines in the mountains of Kabul. The metal is of a grey colour, and veined – it becomes very sharp.

38. Taifand, Zakariya Al Kazwini[38]

Taifand – An impregnable fortress upon the summit of a moun-tain in India, to which there is only one way of access. On the top of this mountain there is water, cultivated land, and all necessary food. Yaminu-d daula Mahmud bin Subuktigin in the year 414 A.H. (1023 A.D.) besieged it for a long time, but at length reduced its garrison to extremities. There were 500 elephants on the mountain. The garrison asked quarter, and it was granted, and the fortress was confirmed to its master on payment of tribute. The lord of the fortress presented many gifts to the Sultan, among which was a bird in the form of a dove. When food containing poison was presented to this bird, tears would fall from its eyes, and the tear drops were converted into stone, which stone being broken and placed upon a wound, it would heal up. This bird is found only in this place, and does not thrive elsewhere.

39. Hu-ch'a-la [the earliest reference to Gujarat in a Chinese work], Chau Ju-Kua,[39]

The kingdom of Hu-ch'a-la rules over a hundred cities and more; its (principal) city has a four-fold wall….

The native products comprise great quantities of indigo, red kino, myrobalans and foreign cotton stuffs of every colour. Every year these goods are transported to the Ta-shi countries for sale.

40. Of the kingdom of Gujarat, Marco Polo[40]

The kingdom of Guzzerat, which is bounded on the western side by the Indian Sea, is governed by its own king, and has its peculiar language…

This country affords harbour to pirates of the most desperate character, who, when in their cruises they seize upon a travelling merchant, immediately oblige him to drink a dose of sea-water, which by its operation on his bowels discovers whether he may not have swallowed pearls or jewels, upon the approach of an enemy in order to conceal them...

Cotton is produced in large quantities from a tree that is about six yards in height, and bears during twenty years; but the cotton taken from trees of that age is not adapted for spinning, but only for quilting. Such, on the contrary, as is taken from trees of twelve years old is suitable for muslins and other manufactures of extraordinary fineness. Great numbers of skins of goats, buffaloes, wild oxen, rhinoceroses, and other beasts are dressed here; and vessels are loaded with them, and bound to different parts of Arabia. Coverlets for beds are made of red and blue leather, extremely delicate and soft, and stitched with gold and silver thread; upon these the Mahometans are accustomed to repose. Cushions also, ornamented with gold wire in the form of birds and beasts, are the manufacture of this place; and in some instances their value is so high as six marks of silver. Embroidery is here performed with more delicacy than in any other part of the world.

41. The Country of Gujarat, *Subh-ul-A'sha*[41]

In it there are a number of cities and towns. *Nahlawara* [Anhilvara, Patan, near Ahmadabad]…It is bigger than Kanbayat and its population is scattered between gardens and water…

Kanbayat [from Khambavati, city of pillars, modern Cambay]…It is a city on the coast of the Indian Ocean…It is a beautiful city bigger than Ma'arra in Sind. Its buildings are of brick and there is also white marble; but there are only a few gardens in it.

Tana: It is a city on the sea side situated in the first of the seven climates...As stated in *Taqwim ul-Buldan,* it belongs to the eastern region of Guzerat. Ibn Said says, "it is a well-known place among the merchants. All the inhabitants of this sea coast", he says, "are infidels who worship idols, and Muslims live with them". Al-Idrisi relates, "its fields and hills produce reed *(qana)* and 'sugar of bamboo' which are exported from there to other

countries. Abu Raiban calls it nisba 'Tanishi;' the 'Tanishi cloth' come from there.

Somnath: It is situated in the second climate…Ibn Said says, "it is well-known among the travellers and is also known as the land of Lar. It is situated on a headland which projects into the sea so that many ships bound for Aden touch it, because it is not in a gulf. It lies on the mouth of a river that comes down from the big mountains lying in the North-east. There was an idol which the Hindus held in great honour and which belonged to this place; it was called the 'Idol of Somnath.'

It was destroyed by Yaminuddaula Mahmud bin Sabuktigin when he conquered it as is mentioned in the historical books.

Sadan…It is a city at three days' distance from Tana, situated in the first of the seven climates…In *Taqwim ul-Buldan* it is said on the authority of some travellers that it is situated on a gulf in the Green Ocean and it is the last region of Guzerat. According to *Al-Qanun* it lies on the sea coast. The author of *Al-Azizi* says "the distance between this place and Mansura is fifteen farsakhs and it is the place where roads converge". He continues, it is the land of costus, male and female bamboos and is one of the biggest ports on the sea…

42. Of the kingdom of Murphili or Monsul, Marco Polo[42]

The kingdom of Murphili is that which you enter upon leaving the kingdom of Maabar, after proceeding five hundred miles in a northerly direction. Its in-habitants worship idols, and are independent of any other state. They subsist upon rice, flesh, fish, and fruits. In the mountains of this kingdom it is that diamonds are found. During the rainy season the water descends in violent torrents amongst the rocks and caverns, and when these have subsided the people go to search for diamonds in the beds of the rivers, where they find many. Messer Marco was told that in the summer, when the heat is excessive and there is no rain, they ascend the mountains with great fatigue, as well as with considerable danger from the number of snakes with which they are infested. Near the summit, it is said, there are deep valleys, full of caverns and surrounded by precipices, amongst which the dia-monds are found; and here many eagles and white storks, attracted by the snakes on which they feed, are accustomed to make their nests. The persons who are in quest of the diamonds take their stand near the mouths

of the caverns, and from thence cast down several pieces of flesh, which the eagles and storks pursue into the valley, and carry off with them to the tops of the rocks. Thither the men immediately ascend, drive the birds away, and recovering the pieces of meat frequently find diamonds sticking to them. Should the eagles have had time to devour the flesh, they watch the place of their roosting at night, and in the morning find the stones amongst the dung and filth that drops from them. But you must not suppose that the good diamonds come among Christians, for they are carried to the grand khan, and to the kings and chiefs of that country. In this country they manufacture the finest cottons that are to be met within any part of India. They have cattle enough, and the largest sheep in the world, and plenty of all kinds of food.

43. Kael, Marco Polo[43]

Kael is a considerable city, governed by Astiar, one of the four brothers, kings of the country of Maabar, who is rich in gold and jewels, and preserves his country in a state of profound peace. On this account it is a favourite place of resort for foreign merchants, who are well received and treated by the king. Accordingly all the ships coming from the west – as from Ormus, Chisti, Aden, and various parts of Arabia – laden with merchandise and horses, make this port, which is besides well situated for commerce. The prince maintains in the most splendid manner not fewer than three hundred women.

44. Of Malabar, Marco Polo[44]

Malabar is an extensive kingdom of the Greater India, situated towards the west…The people are governed by their own king, who is independent of every other state, and they have their proper language. In this country the north star is seen about two fathoms above the horizon. As well here as in the kingdom of Guzzerat…there are numerous pirates, who yearly scour these seas with more than one hundred small vessels, seizing and plundering all the merchant ships that pass that way. They take with them to sea their wives and children of all ages, who continue to accompany them during the whole of the summer's cruise. In order that no ships may escape them, they anchor their vessels at the distance of five miles from each other; twenty ships thereby occupying a space of an hundred miles. Upon a trader's appearing in sight of one of them, a signal is made by fire or by

smoke; when they all draw closer together, and capture the vessel as she attempts to pass. No injury is done to the persons of the crew; but as soon as they have made prize of the ship, they turn them on shore, recommending to them to provide themselves with another cargo, which, in case of their passing that way again, may be the means of enriching their captors a second time.

In this kingdom there is vast abundance of pepper, ginger, cubebs, and Indian nuts; and the finest and most beautiful cottons are manufactured that can be found in any part of the world. The ships from Manji bring copper as ballast; and besides this, gold brocades, silks, gauzes, gold and silver bullion, together with many kinds of drugs not produced in Malabar; and these they barter for the commodities of the province. There are merchants on the spot who ship the former for Aden, from whence they are transported to Alexandria.

45. The Province of Manibar [from Sanskritised Malayabar, *bar* indicates that which is both a coast and a kingdom], *Subh-ul-A'sha*[45]

It a region of Hind in the east of the Province of Guzarat which has already been mentioned. The author of *Taqwim ul-Buldan* says Manibar is the country of pepper. The pepper-tree has bunches like the ears of the millet plant and its tree entwines itself round other trees as the grape-vine does. There are many cities and all the districts of Manibar are green and abound in water and dense trees….

Shaliyat [Mount Delly, Eli in Portuguese sources, on the Malabar coast]: ["I went then to Shalyat, a very pretty town, where they make the stuff that bear its name" (shawl).

Kaulam [Quilon]: It is situated in the first climate…Ibn Said says, "it is the last of the land of pepper in the East. From that place ships sail to Aden…" There are many gardens and the long-wood grows there: this is a tree like that of pomegranate and its leaves resemble that of vine-grapes. There is a quarter for the Muslims and a Mosque.

46. The Country of Mabar, *Subh-ul-A'sha*[46]

Ibn Said says, "it is well known and muslin is exported from there; and its washermen are proverbial. In the North there are mountains adjoining the kingdom of Balhara the king of India. In the South the river Sulyan falls

into the Sea. In *Masalik ul-Absar* it is mentioned on the authority of the chief Qazi Sirajuddin al-Hind that the country of Mabar consists of numerous big islands. There are many cities and towns on them.

47. Fabrics at Shaliyat [near Calicut], Ibn Battuta[47]

I went on from there to ash-Shaliyat, a most beautiful town, in which the fabrics called by its name are manufactured.

48. Calicut, Abder Razzak[48]

Calicut is a perfectly secure harbour, which, like that of Ormuz, brings together merchants from every city and from every country; in it are to be found abundance of precious articles brought thither from maritime countries, and especially from Abyssinia, Zirbad, and Zanguebar; from time to time ships arrive there from the shores of the House of God [Mecca] and other parts of the Hedjaz, and abide at will, for a greater or longer space, in this harbour; the town is inhabited by Infidels, and situated on a hostile shore.

It contains a considerable number of Mussulmauns, who are constant residents, and have built two mosques, in which they meet every Friday to offer up prayer. They have one Kadi, a priest, and for the most part they belong to the sect of Schafei.

Security and justice are so firmly established in this city, that the most wealthy merchants bring thither from maritime countries considerable cargoes, which they un-load, and unhesitatingly send into the markets and the bazaars, without thinking in the meantime of any necessity of checking the account or of keeping watch over the goods. The officers of the custom-house take upon themselves the charge of looking after the merchandise, over which they keep watch day and night. When a sale is effected, they levy a duty on the goods of one-fortieth part; if they are not sold, they make no charge on them whatsoever.

49. Calicut, Athanasius Nikitin[49]

Calecot (Calicut) is a port for the whole Indian sea, which God forbid any craft to cross, and whoever saw it will not go over it healthy. The country produces pepper, ginger, colour plants, muscat, cloves, cinnamon, aromatic roots, *adrach* (?) and every description of spices, and everything is cheap and servants and maids are very good.

50. Horses at Calicut, Wang Ta-Yuan[50]

They have fine horses which come from the extreme West, and which are brought here by the shipload. Each horse will fetch from an hundred to a thousand pieces of gold, even going as high as four thousand, and the foreign people who fetch them thither would think the market a very bad one if they did not.

51. Cochin, Fel Hsin[51]

This locality is on a headland facing Hsi-lan (Ceylon). To the interior it confines on Ku-li. The climate is constantly hot, the soil is poor, the crops sparse. The villages are on the sea-shore. The usages and customs are honest…

The natural product is a great abundance of pepper. Wealthy people put up broad godowns in which to store it. In their trading transactions they use a small gold coin called *panan (fanam)*. The goods used in trading are coloured satins, white silk, blue and white porcelain-ware, gold and silver.

52. Merchants at Cochin, Ma Huan[52]

All trading transactions are carried on by the Chittis, who buy the pepper from the farmers when it is ripe, and sell it to foreign ships when they pass by. They also buy and collect precious stones and other costly wares. A pearl weighing three-and-a-half candareens can be bought for a hundred ounces of silver. Coral is sold by the catti; inferior pieces of coral are cut into beads and polished by skilled workmen; these are also sold by weight. The coinage of the country is a gold piece, called Fa-nan, weighing one candareen; there is also a little silver coin called a Ta-urh, which is used for making small purchases in the market. Fifteen Ta-urhs make a Fa-nan.

There are no asses or geese in this country, and there is neither wheat nor barley; rice, maize, hemp, and millet abound. Articles of tribute are sent to China by our ships on their return voyage.

53. Coimbatore, Ma Huan[53]

…the kingdom or city of K-an-pa-mei [Coimbatore] [is] a great seat of cotton manufacture where is made, as also in the surrounding districts, a cloth called Chih-li (Chih-li-pu) cloth. It is made up into pieces, four feet five inches wide and twenty-five feet long; it is sold there for eight or ten gold pieces of their money. They also prepare raw silk for the loom which they dye various shades of colour and then weave into flowered pattern

goods made up into pieces four to five feet wide and twelve to thirteen feet long. Each length is sold for one hundred gold pieces of their money.

54. Wonderful harbour at Fattan [Kaveripattam or Negapattam], Ibn Battuta[54]

I left the camp and reached Fattan [Kaveripattam or Negapattam?], which is a large and fine city on the coast, with a wonderful harbour. There is a great wooden pavilion in it, erected on enormous beams and reached by a covered wooden gallery. When an enemy attacks the place they tie all the vessels in port to this pavilion, which is manned by soldiers and archers, so that the enemy has no chance [of capturing them]. In this city there is a fine mosque, built of stone, and it has also large quantities of grapes and excellent pomegranates. I met here the pious shaykh Muhammad of Nishapur, one of the crazy darwishes who let their hair hang loose over their shoulders. He had with him a lion which he had tamed, and which used to eat and sit along with the darwishes. Accompanying him were about thirty darwishes, one of whom had a gazelle. Though the gazelle and the lion used to be together in the same place, the lion did not molest it.

55. The city and seaport of Pelagonda, Nicolo Conti[55]

The very noble city of Pelagonda is subject to the same king; it is ten miles in circumference, and is distant eight days' journey from Bizenegalia. Travelling afterwards hence by land for twenty days he arrived at a city and seaport called Peudifetania, on the road to which he passed two cities, viz., Odeschiria and Cenderghiria, where the red sandal wood grows.

56. Trade at Bedar, Athanasius Nikitin[56]

In Bedar there is a trade in horses, goods, stuffs, silks, and all sorts of other merchandise, and also in black people; but no other article is sold but Indian goods, and every kind of eatables; no goods, however, that will do for Russia. And all are black and wicked, and the women all harlots, or witches, or thieves and cheats; and they destroy their masters with poison.

57. Trade routes, Ibn Khurdadhbih[57]

The Jewish merchants…travel from the West to the East, and from the East to the West, now by land and now by sea…. they embark on the Eastern sea (Red Sea) and go from Colzom to Hedjaz and Jidda; and then to

Sind, India and China. On their return they bring musk, aloes, camphor, cinnamon and other products of the eastern countries….

B. Ships and Navigation

1. Ships 'mighty frail,' John of Monte Corvino[58]

Their ships in these parts are mighty frail and uncouth, with no iron in them, and no caulking. They are sewn like clothes with twine. And so if the twine breaks anywhere there is a breach indeed! Once every year therefore there is a mending of this, more or less, if they propose to go to sea. And they have a frail and flimsy rudder like the top of a table, of cubit in width, in the middle of the stern; and when they have to tack, it is done with a vast deal of trouble; and if it is blowing in any way hard, they cannot tack at all. They have but one sail and one mast, and the sails are either matting or of some miserable cloth. The ropes are of husk.

Moreover their mariners are few and far from good. Hence they run a multitude of risks, insomuch that they are wont to say, when any ship achieves her voyage safely and soundly, that 'tis by God's guidance, and man's skill hath little availed. -

2. Ships and navigation, Nicolo Conti[59]

The natives of India steer their vessels for the most part by the stars of the southern hemisphere, as they rarely see those of the north.

They are not acquainted with the use of the compass, but measure their courses and the distances of places by the elevation and depression of the pole. They find out where they are by this mode of measurement. They build some ships much larger than ours, capable, of containing two thousand butts, and with five sails and as many masts. The lower part is constructed with triple planks, in order to withstand the force of the tempests to which they are much exposed. But some ships are so built in compartments, that should one part be shattered, the other portion remaining entire may accomplish the voyage.

3. Chinese ships at Calicut, Ma Huan[60]

When a ship arrives from China, the king's overseer and a Chitti go on board and make an invoice of the goods, and a day is settled for valuing the cargo. On the day appointed the silk goods, more especially the Khinkis (Kincobs), are first inspected and valued, which when decided on, all

present join hands, whereupon the broker says, “The price of your goods is now fixed, and cannot in any way be altered.”

The price to be paid for pearls and precious stones is arranged by the Weinaki broker, and the value of the Chinese goods taken in exchange for them is that previously fixed by the broker in the way above stated.

C. Pearl fishery

Fishery of pearls at Maabar [the Coromandel coast], Marco Polo[61]

Leaving the island of Zeilan, and sailing in a westerly direction sixty miles, you reach the great province of Maabar, which is not an island, but a part of the continent of the Greater India, as it is termed, being the noblest and richest country in the world. It is governed by four kings, of whom the principal is named Sender-bandi. Within his dominions is a fishery for pearls, in the gulf of a bay that lies between Maabar and the island of Zeilan, where the water is not more than from ten to twelve fathoms in depth, and in some places not more than two fathoms. The business of the fishery is conducted in the following manner. A number of merchants form themselves into separate companies, and employ many vessels and boats of different sizes, well provided with ground-tackle, by which to ride safely at anchor. They engage and carry with them persons who are skilled in the art of diving for the oysters in which the pearls are enclosed. These they bring up in bags made of netting that are fastened about their bodies, and then repeat the operation, rising to the surface when they can no longer keep their breath, and after a short interval diving again. In this operation they persevere during the whole of the day, and by their exertions accumulate (in the course of the season) a quantity of oysters sufficient to supply the demands of all countries. The greater proportion of the pearls obtained from the fisheries in this gulf, are round, and of a good lustre. The spot where the oysters are taken in the greatest number is called Betala, on the shore of the mainland; and from thence the fishery extends sixty miles to the southward.

In consequence of the gulf being infested with a kind of large fish, which often prove destructive to the divers, the merchants take the precaution of being accompanied by certain enchanters belonging to a class of Brahmans, who, by means of their diabolical art, have the power of constraining and

stupefying these fish, so as to prevent them from doing mischief; and as the fishing takes place in the daytime only, they discontinue the effect of the charm in the evening; in order that dishonest persons who might be inclined to take the opportunity of diving at night and stealing the oysters, may be deterred by the apprehension they feel of the unrestrained ravages of these animals. The enchanters are likewise profound adepts in the art of fascinating all kinds of beasts and birds. The fishery commences in the month of April, and lasts till the middle of May. The privilege of engaging in it is farmed of the king, to whom a tenth part only of the produce is allowed; to the magicians they allow a twentieth part, and consequently they reserve to themselves a considerable profit. By the time the period above-mentioned is completed, the stock of oysters is exhausted; and the vessels are then taken to another place, distant full three hundred miles from this gulf, where they establish themselves in the month of September, and continue till the middle of October. Independently of the tenth of the pearls to which the king is entitled, he requires to have the choice of all such as are large and well-shaped; and as he pays liberally for them, the merchants are not disinclined to carry them to him for that purpose.

D. Communications

Postal service of two kinds, Ibn Battuta[62]

In India the postal service is of two kinds. The mounted couriers travel on horses belonging to the sultan with relays every four miles. The service of couriers on foot is organized in the following manner. At every third of a mile there is an inhabited village, outside which there are three pavilions. In these sit men girded up ready to move off, each of whom has a rod a yard and a half long with brass bells at the top. When a courier leaves the town he takes the letter in the fingers of one hand and the rod with the bells in the other, and runs with all his might. The men in the pavilions, on hearing the sound of the bells, prepare to meet him, and when he reaches them one of them takes the letter in his hand and passes on, running with all his might and shaking his rod until he reaches the next station, and so the letter is passed on till it reaches its destination. This post is quicker than the mounted post. It is sometimes used to transport fruits from Khurasan which are highly valued in India; they are put on plates and carried with great

speed to the sultan. In the same way they transport the principal criminals; they are each placed on a stretcher and the couriers run carrying the stretcher on their heads. The sultan's drinking water is brought to him by the same means, when he resides at Dawlat Abad, from the river Kank (Ganges), to which the Hindus go on pilgrimage and which is at a distance of forty days' journey from there.

E. Artisans

1. Steel manufacturing, Al-Idrisi[63]

The Indians are very good at making various compounds of mixtures of substances with the help of which they melt the malleable iron; it then turns into Indian iron, and is called after *al-Hind*. There, in *al-Hind*, are workshops where swords are manufactured, and their craftsmen make excellent ones surpassing those made by other peoples.…no iron is comparable to the Indian one in sharpness.

2. Artisans skilled, Shihabuddin al Umari[64]

In it [the land] are artisans such as makers of swords, bows and spears and different kinds of weapons and coat of mail, goldsmiths, embroiderers, saddlers and masters of every craft who make special things for men and women and masters of swords and pen and the common people of whom the number cannot be reckoned.

3. Artisans of Delhi sent to Samarkand, Timur[65]

I ordered that all the artisans and clever mechanics, who were masters of their respective crafts, should be picked out from among the prisoners and set aside, and accordingly some thou-sands of craftsmen were selected to await my command. All these I distributed among the princes and *amirs* who were present, or who were engaged officially in other parts of my dominions. I had determined to build a *masid-i jami* in Samarkand, the seat of my empire, which should be without rival in any country; so I ordered that all builders and stone-masons should be set apart for my own especial service.

F. Weights and measures

1. Hindu metrology and measurement, Alberuni[66]

Counting is innate to man. The measure of a thing becomes known by its being compared with another thing which belongs to the same species and is assumed as a unit by general consent. Thereby the difference between the object and this standard becomes known.

By weighing, people determine the amount of gravity of heavy bodies, when the tongue of the scales stands at right angles on the horizontal plane. Hindus want the scales very little, because their *dirhams* are determined by number, not by weight, and their fractions, too, are simply counted as so-and-so many *fulus*. The coinage of both *dirhams* and *fulus* is different according to towns and districts. They weigh gold with the scales only when it is in its natural state or such as has been worked, *e.g.* for ornaments, but not coined. They use as a weight of gold the *Suvarna* = 1 ½ *tola.* They use the *tola* as frequently as we use the *mithkal.* According to what I have been able to learn from them, it corresponds to 3 of our *dirhams,* of which 10 equal 7 *mithkal.*

Therefore 1 *tola = 2-1/10* of our *mithkal.*

The greatest fraction of a *tola* is *1/12* called *masha.*

Therefore 16 *masha* = 1 *suvarna...*

The reader must know that 16 *masha* are 1 *suvarna,* but in weighing wheat or barley they reckon 4 *suvarna* = 1 *pala,* and in weighing water and oil they reckon 8 *survarna* = 1 *pala.*

The Hindu balance

The balances with which the Hindus weigh things are…of which the weights are immovable, whilst the scales move on certain marks and lines.

Therefore the balance is called *tula.* The first lines mean the units of the weight from 1 to 5, and farther on to 10; the following lines mean the tenths, 10, 20, 30, &c...

Dry measurement

By measuring (with dry measures) people determine the body and the bulk of a thing, if it fills up a certain measure which has been gauged as containing a certain quantity of it, it being understood that the way in which the things are laid out in the measure, the way in which their surface is determined, and the way in which, on the whole, they are arranged within the measure, are in every case identical. If two objects which are to be weighed belong to the same species, they then prove to be equal, not only in

bulk, but also in weight; but if they do not belong to the same species, their bodily extent is equal, not their weight.

They have a measure called *bisi* (? *sibi),* which is mentioned by every man from Kanauj and Somanath…

From the same source I learnt that a *mana* of wheat is nearly equal to 5 *mana.* Therefore 1 *bisi* {?) is equal to 20 *mana...*

Measurement of distance

Mensuration is the determination of distances by lines and of superficies by planes. A plane ought to be measured by part of a plane, but the mensuration by means of lines effects the same purpose, as lines determine the limits of planes. When, in quoting Varahamihira, we had come so far as to determine the weight of a barley-corn, we made a digression into an exposition of weights, where we used his authority about gravity, and now we shall return to him and consult him about distances. He says:-

8 barley-corns put together = 1 *angula, i.e.* finger.

4 fingers = 1 *rama* (?), *i.e.* the fist.

24 fingers = 1 *hattha, i.e.* yard, also called *dasta.*

4 yards = 1 *dhanu, i.e.* arc = a fathom.

40 arcs = 1 *nalva.*

25 *nalva* = 1 *krosa*

Hence it follows that I *kroh* = 4000 yards; and as our mile has just so many yards, 1 mile = 1 *kroh.* Pulisa the Greek also mentions in his Siddhanta that 1 *kroh* = 4000 yards. .

The *yard* is equal to 2 *mikyas* or 24 fingers; for the Hindus determine the *sanku, i.e. mikyas,* by idol-fingers. They do not call the twelfth part of a *mikyas* a *finger* in general, as *we* do, but their *mikyas* is always a *span.* The span, *i.e.* the distance between the ends of the thumb and the small finger at their widest possible stretching, is called *vitasti* and also *kishku.*

The distance between the ends of the fourth or ring-finger and the thumb, both being stretched out, is called *gokarna.*

The distance between the ends of the index-finger and of the thumb is called *karabha,* and is reckoned as equal to two-thirds of a span.

The distance between the tops of the middle finger and of the thumb is called *tala.* The Hindus maintain that the height of a man is eight times his

tala, whether he be tall or small; as people say with regard to the foot, that it is one-seventh of the height of a man…

Yojana

After the measure of the *krosa* has been fixed and found to be equal to our *mile,* the reader must learn that they have a measure of distances, called *yojana,* which is equal to 8 miles or to 32,000 yards….

Circumference and diameter

The elements of the calculations of the Hindus on the circumference of the circle rest on the assumption that it is *thrice its diameter.* So the *Matsya-Purana* says, after it has mentioned the diameters of the sun and moon in *yojanas:* "The circumference is thrice the diameter."…

The same occurs also in the *Vayu-Purana.* In later times, however, Hindus have become aware of the fraction following after the three wholes. According to Brahmagupta, the circumference is times the diameter; but he finds this number by a method peculiar to himself…

2. Measures and weights, *Subh-ul-A'sha*[67]

There appears to have been no uniformity in the standards of weights and measures in India which differed according to the locality as well as the article to be weighed or measured. The coins used at the time were also measures of weight. That accounts for the pains taken by the state to maintain the purity and the weight of the coins…

According to the author of *Masalik ul-Absar* the *mann* of Delhi was equal to 70 *mithqals*. Taking a *mithqal* to be equal to 72 grains, a *sir* would weigh 29 *tolas* and 2 *mashas* or 5040 grains, a maund would be equal to modern seers or 28.8 Ibs avoirdupois….

As regards gold, they weigh it by *mithqal*. Every three *mithqals* are called '*Tanga'*. The gold Tanga is know as '*Red Tanga*' and the Silver Tanga is known as '*White Tanga*'. Every 100,000 Tangas whether of gold or of silver are called Lukk (*lakh*).

However, the gold lukk is called 'Red Luk*'* and silver lukk is called 'White Lukk*'*.

The *ratl* is known among them as *'sir',* the weight of which is seventy mithqals *i.e.* Egyptian Dirhams. Every forty '*sir'* are equal to one '*mann'*. They sell all things by weight. Measurement *(kail)* is unknown to them.

G. Coinage and Currency

1. Coinage in Mansura, Ibn Haukal[68]

The current coin of the country is stamped at Kandahar; one of the pieces is equivalent to five dirhams. The Tatari coin also is current, each being in weight equal to a dirham and a third. They likewise use dinars.

2. Coinage of Malabar, Chau Ju-Kua[69]

They cut an alloyed silver into coins; on these they stamp an official seal. The people use these in trading.

3. Coins, measures, and weights, Shihabuddin al Umari[70]

Sheikh Mubarak related to me: the 'red tanka' is equal to three mithqals and the white tanka, namely the silver tanga has eight hashtgani-dirhams. This hashtgani-dirham has the weight of the silver Dirham which is current in Egypt and Syria. Its value is the same as that and there is hardly a difference between them. This hashtgani Dirham has four Sultani-dirhams and it is called dogani. This Sultani-dirham comes to one-third of the shashtgani-dirhams and this is a kind of money which is used in India. Its value is three-quarter of the hashtgani-dirham. The half of this Sultani-dirham is called yegani and is one jital. Another dirham is called dawazdeh-gani the value of which is one and a half hashtgani-dirhams. Another dirham is called shanzdehgani the value of which corresponds to two dirhams. In these days the dirhams of India are six: Shanzdehgani, dawazdehgani, hashtgani, shashtgani, sultani and yagani. The smallest of them is the Sultani-dirham. All these three dirhams are current and the commercial transactions amongst them (Indians) are performed with them, but mostly with the sultani-dirham which corresponds to a fourth of the Egyptian and Syrian dirham. This sultani-dirham consists of eight fulus or two jitals every jital being four fulus so that the hashtgani-dirham which corresponds to the quarter of a silver dirham current in Egypt and Syria, has 32 fulus. Their ritl is called 'seer' and it weighs seventy mithqals, which are equal to 102 2/5 Egyptian dirhams. Every forty seer make one maund. They do not know the use of a measure.

4. About coins, *Subh-ul-A'sha*[71]

Until recent years the two most widely used coins in Muslim countries were the '*dinar'* and the '*dirham'*. The same coins appear to have been

introduced in the newly conquered countries by the Muslims. These coins in India were succeeded by the *'tanga'* and the *'jital'* till the latter gave place to the *'rupee'* and the *'peisa.'*...

5. Various kinds of money, Nicolo Conti[72]

Some regions have no money, but use instead stones which we call cats' eyes. In other parts their money consists of pieces of iron, worked into the form of large needles. In others the medium of exchange consists of cards inscribed with the name of the king. In some parts again of anterior India, Venetian ducats are in circulation. Some have golden coins, weighing more than the double of our florin, and also less, and, moreover silver and brass money. In some places pieces of gold worked to a certain weight are used as money.

6. Currency at Vijayanagar, Abder Razzak[73]

In this country they have three kinds of money, made of gold mixed with alloy: one called v*arahah* weighs about one *mithkal,* equivalent to two dinars, *kopeki;* the second, which is called *pertab,* is the half of the first; the third, called *fanom,* is equivalent in value to the tenth part of the last-mentioned coin. of these different coins the *fanom* is the most useful. They cast in pure silver a coin which is the sixth of the *fanom,* which they call *tar.* This latter is also a very useful coin in currency. A copper coin worth the third of a *tar,* is called *djitel.* According to the practice adopted in this empire, all the provinces, at a fixed period, bring their gold to the mint. If any man receive from the divan an allowance in gold he has to be paid by the *darab-khaneh.* The soldiers receive their pay every four months, and no payment is ever made by a draft upon the revenues of any province.

7. Money at Calicut, Ma Huan[74]

As in Cochin, the money in circulation is the Fa-nan and the Ta-urh. Their weights are the P'o-ho and the Fan-la-shih and there is a measure called a Tang-ko-li.

The king's present to the Emperor is usually a gold-plaited girdle set with all kinds of precious stones and pearls.

H. Prices and markets

1. Prices of eatables, *Subh-ul-A'sha*[75]

It is related on the authority of Sheikh Mubarak ul-Anbati, who lived before 730 (A.H.) that the average rates at that time were (one and a half) Hasht-gani Dirhams for one *mann* of wheat and one Hasht-gani for one *mann* of barley and Hasth-gani for one *mann* of rice except the famous kinds which were dearer than this. Peas were two *mann* for one Hasht-gani. Four Astar of beef and mutton for one Sultani-Dirham. Two Hasht gani for a pair of ducks. Four pairs of hen for one Hasht-gani. Five sirs of sugar for one Hasht-gani. A nice fat goat for one tanga *(i.e.* eight Hasht-gani Dirhams) and a nice cow for two tangas (*i.e.* sixteen Hasht-gani Dirham) and sometimes even less, and similar was the price of a buffalo.

Pigeons, sparrows and other kinds of birds were very cheap. The kinds of animals and birds for game are many. What they mostly eat is the flesh of cow and goat though they have many sheep. Because they have become accustomed to it.

It has been reported in *Masalik ul-Absar* on the authority of Khujandi who says, "I and my three friends ate beef, bread and melted-butter for one jital in some places of Delhi till we were satisfied." A jital is equal to four pice *(fulus)* as has been mentioned above.

2. Abundance of food, Shihabuddin al Umari[76]

As regards butter and milk of different kinds, they are so abundant that they mean nothing and no value is attached to them. In the bazars different kinds of foods are sold, for instance, roast meat, rice, baked and fried things, sweets of sixty-five kinds, fruit-drinks and sherbets which are hardly to be found in any other city.

3. Prices of girl slaves, Shihabuddin al Umari[77]

Ibn al-Taj al-Hafiz al-Multani said to me: I asked how a slave girl could reach this price in spite of the cheapness (in the country). Each one of them informed me severally in interviews that the difference was caused by the grace of her deportment or the refinement of her manners and that a great number of these slave girls knew the Quran by heart, they could write, recite verses and stories, excelled in music, played the lute and chess and backgammon (nard) and so on. The slave girls take pride in things like these. One of them says: I shall capture the heart of my master within three days; the other says: I shall captivate his heart in one day, a third says: I shall captivate his heart in an hour, another says I shall captivate his heart in

the twinkling of an eye. They say that the pretty Indian girls are superior as regards beauty to those of the Turks and Qipchaks besides their good breeding manifold accomplishments and attainments which give them distinction. Most of them are of golden colour some of them are of brilliant whiteness mixed with red. In spite of the great number of Turks and Qipchaks and Byzantines and other nationalities that are there everyone gives preference to none but the Indian pretty girls on account of their perfect beauty and sweetness and other things which words cannot describe.

4. Rates of girl slaves, *Subh-ul-A'sha*[78]

The author of *Masalik ul-Absar* has mentioned the rates of India in his time quoting from *Qadi ' I-Qudat Sirajuddin al Hindi* and others. He relates that a maid-servant's price in Delhi does not exceed eight tangas, and those who are fit for service as well as for conjugal purposes cost fifteen tangas. Outside Delhi they are still cheaper. Qadi Sirajuddin narrated that he once bought a coquettish slave nearing puberty for four Dirhams. He continues, "In spite of this cheapness there are Indian maid-servants whose price amounts to twenty thousand tangas or more on account of their beauty and grace".

5. Horse fair, Athanasius Nikitin[79]

There is a place *Shikhbaludin Peratyr,* a bazaar Aladinand, and a fair once a year, where people from all parts of India assemble and trade for ten days. As many as 20,000 horses are brought there for sale from Bedar, which is 20 *kors* distant, and besides every description of goods; and that fair is the best throughout the land of Hindostan. Every thing is sold or bought in memory of Shikbaladin, whose fete falls on the Russian festival of the Protection of the Holy Virgin (1st October).

CHAPTER — 5

Architecture

A. Cities, Town Planning
B. Forts
C. Temples

A. Cities, Town Planning

CHOLA KINGDOM

1. City walls in the Chola Dominion [Coromandel Coast], Chau Ju-Kua[1]

In this kingdom there is a city with a seven-fold wall, seven feet high and extending twelve *li* from north to south and seven *li* from east to west. The different walls are one hundred paces distant from each other. Four of these walls are of brick, two of mud, and the one in the centre of wood. There are flowers, fruit trees, and other trees planted (on them?).

The first and second walls enclose the dwellings of the people, – they are surrounded by small ditches; the third and fourth walls (surround) the dwellings of the court officers; within the fifth dwell the king's four sons; within the sixth are the Buddhist (i.e., idol) monasteries where the priests dwell; the seventh wall encloses over four hundred buildings forming the royal palace.

2. Capital of Tchu-Lien [Chola country], Ma Twan-lin[2]

The capital of *Tchu-lien* has seven enclosing walls, with a height of seven *tchi*, and a hundred paces apart from one another. The outermost enclosure has a diameter of twelve *li* from south to north, and seven *li* from east to west. The first four walls are built of brick; the two following are of mud, and that of the interior is of wood. All are covered with espaliers, or decorated with flowers. The first three enclosures are occupied by the people and include numerous water courses. The fourth enclosure contains the houses of four great officers. The fifth enclosure belongs to the sons of the king. In the sixth is a temple of Buddha, served by hundred Buddhist priests. Finally the seventh contains the palace of the king, or royal town, comprising more than four hundred buildings. The towns of the second

order are thirty-one in number, twelve to the west of the royal residence, eight to the south, and eleven to the north. The reigning dynasty has occupied the throne for three generations [this indicates that part of this notice was written in the time of Rajaraja I].

DELHI

3. Delhi a magnificent city, Ibn Battuta[3]

On the next day we arrived at the city of Dihli [Delhi], the metropolis of India, a vast and magnificent city, uniting beauty with strength. It is surrounded by a wall that has no equal in the world, and is the largest city in India, nay rather the largest city in the entire Muslim Orient.

The city of Delhi is made up now of four neighbouring and contiguous towns. One of them is Delhi proper, the old city built by the infidels and captured in the year 1188. The second is called Siri, known also as the Abode of the Caliphate; this was the town given by the sultan to Ghiyath ad-Din, the grandson of the Abbasid Caliph Mustansir, when he came to his court. The third is called Tughlaq Abad, after its founder, the Sultan Tughlaq, the father of the sultan of India to whose court we came. The reason why he built it was that one day he said to a former sultan "O master of the world, it were fitting that a city should be built here." The sultan replied to him in jest "When you are sultan, build it." It came about by the decree of God that he became sultan, so he built it and called it by his own name. The fourth is called Jahan Panah, and is set apart for the residence of the reigning sultan, Muhammad Shah. He was the founder of it, and it was his intention to unite these four towns within a single wall, but after building part of it he gave up the rest because of the expense required for its construction.

Mosque

The cathedral mosque occupies a large area; its walls, roof, and paving are all constructed of white stones, admirably squared and firmly cemented with lead. There is no wood in it at all. It has thirteen domes of stone, its pulpit also is made of stone, and it has four courts.

Iron Pillar

In the centre of the mosque is an awe-inspiring column [the Iron Pillar], and nobody knows of what metal it is constructed. One of their learned men told me that it is called *Haft Jush,* which means 'seven metals,' and that it is constructed from these seven. A part of this column, of a finger's breadth, has been polished, and gives out a brilliant gleam. Iron makes no impression on it. It is thirty cubits high [the figure is exaggerated], and we rolled a turban round it, and the portion which encircled it measured eight cubits. At the eastern gate there are two enormous idols of brass prostrate on the ground and held by stones, and everyone entering or leaving the mosque treads on them. The site was formerly occupied by an idol temple, and was converted into a mosque on the conquest of the city.

Qutb Minar

In the northern court is the minaret [Qutb Minar], which has no parallel in the lands of Islam. It is built of red stone, unlike the rest of the edifice, ornamented with sculptures, and of great height. The ball on the top is of glistening white marble and its 'apples' [small balls surmounting a minaret] are of pure gold. The passage is so wide that elephants could go up by it. A person in whom I have confidence told me that when it was built he saw an elephant climbing with stones to the top. The Sultan Qutb ad-Din [actually Alauddin Khalji], wished to build one in the western court even larger, but was cut off by death when only a third of it had been completed. This minaret is one of the wonders of the world for size, and the width of its passage is such that three elephants could mount it abreast. The third of it built equals in height the whole of the other minaret we have mentioned in the northern court, though to one looking at it from below it does not seem so high because of its bulk.

Reservoir

Outside Delhi is a large reservoir named after the Sultan Lalmish, from which the inhabitants draw their drinking water. It is supplied by rain water, and is about two miles in length by half that breadth. In the centre there is a great pavilion built of squared stones, two stories high. When the reservoir is filled with water it can be reached only in boats, but when the water is low the people go into it. Inside it is a mosque, and at most times it is occupied by mendicants devoted to the service of God. When the water dries up at the sides of this reservoir, they sow sugar canes, cucumbers,

green melons and pumpkins there. The melons and pumpkins are very sweet but of small size. Between Delhi and the Abode of the Caliphate is the private reservoir, which is larger than the other. Along its sides there are about forty pavilions, and round about it live the musicians.

4. Aibak built Jama Masjid from temple materials, Hasan Nizami[4]

Kutbn-d din built the Jami Masjid at De1hi, and "adorned it with the stones and gold obtained from the temples which had been demolished by elephants," and covered it with "inscriptions in Toghra, containing the divine commands."

5. The Hauz-I Khas, Timur[5]

This is a reservoir, which was constructed by Sultan Firoz Shah, and is faced all round with stone and cement *(gach)*. Each side of that reservoir is more than a bow-shot long, and there are buildings placed around it. This tank is filled by the rains in the rainy season, and it supplies the people of the city with water throughout the year. The tomb of Sultan Firoz Shah stands on its bank.

6. Tour of city, Timur[6]

When my mind was no longer occupied with the destruction of the people of Dehli, I took a ride round the cities. Siri is a round city *(shahr)*. It buildings are lofty. They are surrounded by fortifications *(kala'h),* built of stone and brick, and they are very strong. Old Dehli also has a similar strong fort, but it is larger than that of Siri. From the fort of Siri to that of Old Dehli, which is a considerable distance, there runs a strong wall, built of stone and cement. The part called Jahan-panah is situated in the midst of the inhabited city (*shahr-i abadan)*. The fortifications of the three cities have thirty gates. Jahan-panah has thirteen gates, seven on the south side bearing towards the east, and six on the north side bearing towards the west. Siri has seven gates, four towards the outside and three on the inside towards Jahan-panah. The fortifications of old Dehli have ten gates, some opening to the exterior and some towards the interior of the city. When I was tired of examining the city I went into the *Masjid-i* jami, where a congregation was assembled of *saiyids,* lawyers, *shaikhs,* and other of the principal Musulmans, with the inhabitants of their parts of the city, to whom they had been a protection and defence. I called them to my presence, consoled them, treated them with every respect, and bestowed upon them

many presents and honours. I appointed an officer to protect their quarter of the city, and guard them against annoyance. Then I remounted and returned to my quarters.

7. Delhi composed of many cities, Shihabuddin al Umari[7]

I enquired from Shaikh Mubarak about the city of Delhi and its condition and the management of the affairs of the Sultans. He related to me that Delhi is composed of many cities which have been united together. Every one of them had a special name and Delhi was only one of them. It is extensive in length and breadth and encloses an area of forty miles. Its buildings are of stone and brick, the roofs of wood and the floor is paved with white stone resembling marble. In it the houses are not built more than two stories high, and in some of them there is a single storey. Nobody paves the floor with marble except the Sultan.

Sheikh Abu Bakr bin al-Khallal says: this refers to the old houses of Delhi. As regards those which I describe, they are not like this. He says all cities to which at present the name Delhi is applied are twenty-one. On three sides are gardens in straight lines, each line twelve miles long. As regards the western side it is destitute of them on account of the proximity of the hills. In Delhi there are one thousand *madrasas* out of which only one belongs to the *Shafites* and the rest to *Hanafites*. There are about seventy hospitals *(bimaristan)* which are called *Dar-ush-Shifa.* In Delhi and its surroundings are Khanqahs and hospices numbering two thousand, big monasteries and extensive bazars and numerous baths. The water is supplied from wells dug near the watering places not deeper than seven forearms on which are hydraulic wheels. They drink rainwater which is collected in big reservoirs, the diameter of each of which is the distance of an arrowshot or more.

In Delhi is the *mosque* [at Qutb] famous for its *minaret* [the Qutb Minar] the like of which is not as he says, on the surface of the world on account of its height and elevation. Sheikh Burhanuddin al-Khallal-al-Bizi as Suli says that its height is *six hundred cubits* in the air. Sheikh Mubarak says: As regards the palaces of the Sultan and his mansions in Delhi, they are exclusively for his dwelling and the dwelling of his wives, his concubines and his eunuchs and apartments for servants and slaves (mamelukes). None of the Amirs and Khans live with him; and none of them stays there except

when he is present on duty; then everyone of them goes back to his own house. They are on duty twice every day in the morning and afternoon.

VIJAYANAGAR

8. City of Vijayanagar unequalled in the world, Abder Razzak[8]

The city of Bidjanagar is such that the pupil of the eye has never seen a place like it, and the ear of intelligence has never been informed that there existed anything to equal it in the world. It is built in such a manner that seven citadels and the same number of walls enclose each other. Around the first citadel are stones of the height of a man, one half of which is sunk in the ground while the other rises above it. These are fixed one beside the other, in such a manner that no horse or foot soldier could boldly or with ease approach the citadel. If any one would wish to find what point of resemblance this fortress and rampart present with that which exists in the city of Heart, let him picture to himself that the first citadel corresponds with that which extends from the mountain of Mokhtar and Direh dou Buraderim (the Valley of the Two Brothers) as far as the banks of the river and the bridge of Malan, situated east of the town of Ghinan, and west of the village of Saiban.

It is a fortress of a round shape, built on the summit of a mountain, and constructed of stones and lime. It has very solid gates, the guards of which are constantly at their posts, and examine everything with a severe inspection.

The second fortress represents the space which extends from the bridge of the new river, to the bridge of the Karav, lying to the east of the bridge of Renghineh and Djakan, and to the west of the garden of Zibendeh and of the village of Hasan.

The third citadel comprises as much space as lies between the mausoleum of the Imaum Fakhr-eddin-Razi and the dome-shaped monument of Mohammed- Sultan-Schah.

The fourth corresponds to the space which separates the bridge Andjil from the bridge of Kared.

The fifth comprises a space equal to that which extends from the garden of Zagan to the bridge of Andjegan.

The sixth is equivalent to the space contained between the King's gate and the gate of Firouz-abad.

The seventh fortress, which is placed in the centre of the others, occupies an area ten times larger than the marketplace of the city of Herat. It is the palace which is used as the residence of the king. The distance from the gate of the first fortress, which lies on the north, to the first gate, which is situated in the south, is calculated to be two para-sangs. It is the same distance from the east to the west. The space which separates the first fortress from the second, and up to the third fortress, is filled with cultivated fields, and with houses and gardens. In the space from the third to the seventh one meets a numberless crowd of people, many shops, and a bazaar. At the gate of the king's palace are four bazaars, placed opposite each other: On the north is the portico of the palace of the *rai*. Above each bazaar is a lofty arcade with a magnificent gallery, but the audience hall of the king's palace is elevated above all the rest. The bazaars are extremely long and broad. The rose merchants place before their shops high *estrades,* on each side of which they expose their flowers for sale. In this place one sees a constant succession of sweet smelling and fresh looking roses. These people could not live without roses, and they look upon them as quite as necessary as food.

9. Shops contiguous at Vijayanagar, Abder Razzak[9]

Each class of men belonging to each profession has shops contiguous the one to the other; the jewellers sell publicly in the bazaar pearls, rubies, emeralds, and diamonds. In this agreeable locality, as well as in the king's palace, one sees numerous running streams and canals formed of chiselled stone, polished and smooth. On the left of the Sultan's portico rises the divan-khaneh (the council-house), which is extremely large and looks like a palace. In front of it is a hall, the height of which is above the stature of a man, its length thirty ghez, and its breadth ten. In it is placed the defter-khaneh (the archives), and here sit the scribes…

B. Forts

1. Gwalior Fort, Ibn Battuta[10]

We journeyed thereafter to Galyur or Guyalyur [Gwalior], a large town with an impregnable fortress isolated on the summit of a lofty hill. Over its gate is an elephant with its mahout carved in stone.

2. Deogiri Fort, Ibn Battuta[11]

The fortress of Duwaygir [Deogiri] mentioned above is a rock situated in a plain; the rock has been excavated and a castle built on its summit. It is reached by a ladder made of leather, which is taken up at night. In its dungeons are imprisoned those convicted of serious crime, and in these dungeons there are huge rats, bigger than cats – in fact, cats run away from them and cannot defend themselves against them, so they can be captured only by employing ruses. I saw them there and marvelled at them.

C. Temples

1. Khajuraho, Ibn Battuta[12]

We went from Parwan [Narwar] to Kajarra [Khajuraho**]**, where there is a large tank about a mile long having on its banks temples with idols, which have been made examples of [i.e. mutilated] by the Muslims.

2. Temple near Mangalore of unequalled beauty, Abder Razzak[13]

The humble author of this narrative having received his audience of dismissal, departed from Calicut by sea. After having passed the port of Bendinaneh [Cananore?], situated on the coast of Melibar, reached the port of Mangalor, which forms the frontier of the kingdom of Bidjanagar [Vijayanagar]. After staying there two or three days he continued his route by land. At a distance of three parasangs from Mangalor he saw a temple of idols, which has not its equal in the universe. It is an equilateral square, of about ten ghez [cubits] in length, ten in breadth, and five in height. It is entirely formed of cast bronze. It has four *estrades.* Upon that in the front stands a human figure, of great size, made of gold; its eyes are formed of two rubies, placed so artistically that the statue seems to look at you. The whole is worked with wonderful delicacy and perfection.

3. Temple at Belur "offered to the world an idea of paradise," Abder Razzak[14]

After passing this temple, I came each day to some city or populous town. At length I came to a mountain whose summit reached the skies, and the

foot of which was covered with so great a quantity of trees and thorny underwood, that the rays of the sun could never penetrate the obscurity; nor could the beneficial rains at any time reach the soil to moisten it. Having left this mountain and this forest behind me, I reached a town called Belour, the houses of which were like palaces, and its women reminded one of the beauty of the Houris. In it there is a temple of idols, so lofty as to be visible at a distance of many parasangs. It would be impossible to describe such a building without being suspected of exaggeration. I can only give a general idea of it. In the middle of the town is an open space, of about ten ghez in extent, and which, if one may use a comparison, rivals the garden of Irem. The roses of all kinds are as numerous as the leaves of the trees, on the borders of the streams rise a great number of cypresses, whose towering height is reflected in the waters, plantain trees shoot out their tufted branches, and it would seem as if heaven itself looks down upon this beautiful spot with pleasure and admiration. All the ground of this parterre, all the environs of this place of delight, are paved with polished stones, joined together with so much delicacy and skill, that they seem to form but one single slab of stone, and look like a fragment of the sky which might be supposed to have been brought down to the earth. In the middle of this platform rises a building composed of a cupola formed of blue stones, and terminating in a point. The stone presents three rows of figures.

What can I say of this cupola, which, as regards the delicacy of the work, offered to the world an idea of paradise?

Its vault, rounded and lofty, resembled a new moon; its elevation vied with that of the heavens.

So great a number of pictures and figures had been drawn by the pen and the pencil, that it would be impossible, in the space of a month, to sketch it all upon damask or taffeta. From the bottom of the building to the top there is not a hand's breadth to be found uncovered with paintings, after the manner of the Franks and the people of Khata [China]. The temple consists of a structure of four estrades; this structure is thirty ghez in length, twenty in breadth, fifty in height.

Since that its head shot up towards the skies, that vault, previously without stones in it, now seems formed of them.

Since that its stones have rubbed themselves against the sun, the gold of that orb has taken a purer alloy.

All the other buildings, great and small, are covered with paintings and sculptures of extreme delicacy. In this temple morning and evening, after devotional exercises, which have nothing in them which can be agreeable to God, they play on musical instruments, perform concerts, and give feasts. All the inhabitants of the town have rents and pensions assigned to them on this temple. The most distant cities send hither their alms. In the opinion of these men without religion, this place is the Kabah of the Guebres.

CHAPTER — 6

Religious Practices

A. Some observations on religion and philosophy
B. Image worship
C. Some important temples
D. Popular pilgrimage sites
E. Certain other customs
F. Cow worship
G. Ascetics
H. On Buddhism
I. Selection of Lama

A. Some observations on religion and philosophy

1. Religion of China derived from India, the merchant Sulaiman[1]

The principles of the religion of China were derived from India. The Chinese say that the Indians brought buddhas into the country, and that they have been the real masters in matters of religion. In both countries they believe in the metempsychosis, but there are some differences upon matters of detail.

2. Very little dispute on theological matters, Alberuni[2]

On the whole, there is very little disputing about theological topics among themselves; at the most, they fight with words, but they will never stake their soul or body or their property on religious controversy. On the contrary, all that fanaticism is directed against those who do not belong to them – against all foreigners. They call them *mleccha, i.e.* impure, and forbid having any connection with them, be it by intermarriage or any other kind of relationship, or by sitting, eating, and drinking with them, because thereby, they think, they would be polluted. They consider as impure anything which touches the fire and the water of a foreigner; and no household can exist without these two elements. Besides, they never desire that a thing which once has been polluted should be purified and thus recovered, as, under ordinary circumstances, if any body or anything has become unclean, he or it would strive to regain the state of purity. They are

not allowed to receive anybody who does not belong to them, even if he wished it, or was inclined to their religion.

3. Aversion of Buddhists, Alberuni[3]

Another circumstance which increased the already existing antagonism between Hindus and foreigners is that the so-called Shamaniyya (Buddhists), though they cordially hate the Brahmans, still are nearer akin to them than to others. In former times, Khurasan, Persis, Irak, Mosul, the country up to the frontier of Syria, was Buddhistic, but then Zarathustra went forth from Adharbaijan and preached Magism in Balkh (Baktra). His doctrine came into favour with King Gushtasp, and his son Isfendiyad spread the new faith both in east and west, both by force and by treaties. He founded fire-temples through his whole empire, from the frontiers of China to those of the Greek empire.

The succeeding kings made their religion *(i.e.* Zoroastrianism) the obligatory state-religion for Persis and Irak. In consequence, the Buddhists were banished from those countries, and had to emigrate to the countries east of Balkh. There are some Magians up to the present time in India, where they are called *Maya.* From that time dates their aversion towards the coun-tries of Khurasan. But then came Islam; the Persian empire perished, and the repugnance of the Hindus against foreigners increased more and more when the Muslims began to make their inroads into their country; for Muhammad Ibn Elkasim Ibn Elmunabbih entered Sindh from the side of Sijistan (Sakastene) and conquered the cities of Bahmanwa and Mulasthana, the former of which he called *Al-mansura,* the latter *Al-mamura.* He entered India proper, and penetrated even as far as Kanauj, marched through the country of Gandhara, and on his way back, through the confines of Kashmir, sometimes fighting sword in hand, sometimes gaining his ends by treaties, leaving to the people their ancient belief, except in the case of those who wanted to become Muslims. All these events planted a deeply rooted hatred in their hearts…

4. Hindu views on God, Alberuni[4]

The Hindus believe with regard to God that he is one, eternal, without beginning and end, acting by free-will, almighty, all-wise, living, giving life, ruling, preserving; one who in his sovereignty is unique, beyond all likeness and unlikeness, and that he does not resemble anything nor does

anything resemble him. In order to illustrate this we shall produce some extracts from their literature, lest the reader should think that our account is nothing but hearsay.

In the book of Patanjali the pupil asks:

"Who is the worshipped one, by the worship of whom blessing is obtained?"

The master says:

"It is he who, being eternal and unique, does not for his part stand in need of any human action for which he might give as a recompense either a blissful repose, which is hoped and longed for, or a troubled existence, which is feared and dreaded. He is unattainable to thought, being sublime beyond all unlikeness which is abhorrent and all likeness which is sympathetic. He by his essence knows from all eternity. Knowledge, in the human sense of the term, has as its object that which was unknown before, whilst not knowing does not at any time or in any condition apply to God."…

In this way the Hindus express themselves in this very famous book…

5. Hindu views on creation, Alberuni[5]

Regarding the whole creation *(ro ov),* they think that it is a unity, as has already been declared, because Vasudeva speaks in the book called *Gita:* "To speak accurately, we must say that all things are divine; for Vishnu made himself the earth that those living beings should rest thereupon; he made himself water to nourish them thereby; he made himself fire and wind in order to make them grow; and he made himself the heart of every single being. He presented them with recollection and knowledge and the two opposite qualities, as is mentioned in the Veda."

Similarity with the book of Apollonius

How much does this resemble the expression of the author of the book of Apollonius, *De Causis Rerum,* as if the one had been taken from the other! He says: "There is in all men a divine power, by which all things, both material and immaterial, are apprehended." Thus in Persian the immaterial Lord is called *Khudha,* and in a derivative sense the word is also used to mean a man, *i.e.* a human lord.

Purusha

I. Those Hindus who prefer clear and accurate definitions to vague allusions call the soul *purusha,* which means *man,* because it is the living element in the existing world. Life is the only attribute which they give to it. They describe it as alternately knowing and not knowing, as not knowing…(actually), and as knowing…(potentially), gaining knowledge by acquisition. The not-knowing of *purusha* is the cause why action comes into existence, and its knowing is the cause why action ceases.

Avyakta

II. Next follows the general matter, *i.e.* the abstract…which they call *avyakta, i.e.* a shapeless thing. It is dead, but has three powers potentially, not actually, which are called *sattva, rajas,* and *tamas.* I have heard that Buddhodana *(sic),* in speaking to his adherents the Shamanians, calls them *buddha, dharma, sangha,* as it were *intelligence, religion,* and *ignorance (sic)*. The first power is rest and goodness, and hence come existing and growing. The second is exertion and fatigue, and hence come firmness and duration. The third is languor and irresolution, and hence come ruin and perishing. Therefore the first power is attributed to the angels, the second to men, the third to the animals. The ideas *before, afterwards,* and *thereupon* may be predicated of all these things only in the sense of a certain sequence and on account of the inadequacy of language, but not so as to indicate any ordinary notions of time.

Vyakta and prakriti

III. Matter proceeding from…into…under the various shapes and with the *three primary forces* is called *vyakta*, *i.e.* having shape, whilst the union of the *abstract...* and of the *shaped matter* is called *prakriti.* This term, however, is of no use to us; we do not want to speak of an *abstract* matter, the term *matter* alone being sufficient for us, since the one does not exist without the other.

Ahankara

IV. Next comes *nature,* which they call *ahankara.* The word is derived from the ideas of *overpowering, developing,* and *self-assertion,* because matter when assuming shape causes things to develop into new forms, and this growing consists in the changing of a foreign element and assimilating it to the growing one. Hence it is as if *Nature* were trying to overpower

those *other* or foreign elements in this process of changing them, and were subduing that which is changed.

Mahabhuta

V-IX. As a matter of course, each compound presupposes simple elements from which it is compounded and into which it is resolved again. The universal existences in the world are the five elements, *i.e.* according to the Hindus: heaven, wind, fire, water, and earth. They are called *mahabhuta, i.e. having great natures.* They do not think, as other people do, that the fire is a hot dry body near the bottom of the ether. They understand by fire the common fire on earth which comes from an inflammation of smoke. The *Vayu Purana* says: "In the beginning were earth, water, wind, and heaven. Brahman, on seeing sparks under the earth, brought them forward and divided them into three parts: the first, *parthiva,* is the common fire, which requires wood and is extinguished by water; the second is *divya, i.e.* the sun; the third, *vidyut, i.e.* the lightning. The sun attracts the water; the lightning shines through the water. In the animals, also, there is fire in the midst of moist substances, which serve to nourish the fire and do not extinguish it."

Panca mataras

X. XIV. As these elements are compound, they presuppose simple ones which are called *panca mataras, i.e.* five mothers. They describe them as the functions of the senses. The simple element of heaven is *sabda, i.e.* that which is heard; that of the wind is *sparsa, i.e.* that which is touched; that of the fire is *rupa, i.e.* that which is seen; that of the water is *rasa, i.e.* that which is tasted; and that of the earth is *gandha, i.e.* that which is smelled. With each of these *mahabhuta* elements (earth, water, &c.) they connect, firstly, *one* of the *panca-mataras* elements, as we have here shown; and, secondly, all those which have been attributed to the *mahabhuta* elements previously mentioned. So the earth has all five qualities; the water has them *minus* the smelling (= four qualities); the fire has them *minus* the smelling and tasting *(i.e.* three qualities); the wind has them *minus* smelling, tasting, and seeing *(i.e.* two qualities); heaven has them *minus* smelling, tasting, seeing, and touching *(i.e.* one quality).

I do not know what the Hindus mean by bringing *sound* into relation with heaven. Perhaps they mean something similar to what Homer, the poet of

the ancient Greeks, said, "*Those invested with the seven melodies speak and give answer to each other in a pleasant tone."* Thereby he meant the seven planets; as another poet says, "*The spheres endowed with different melodies are seven, moving eternally, praising the Creator, for it is he who holds them and embraces them unto the farthest end of the starless sphere."...*

The result of all these elements which we have enumerated, *i.e.* a compound of all of them, is the animal. The Hindus consider the plants as a species of animal as Plato also thinks that the plants have a sense, because they have the faculty of distinguishing between that which suits them and that which is detrimental to them. The animal is an animal as distinguished from a stone by virtue of its possession of the senses.

Indriyani

XV.-XIX. The senses are five, called *indriyani,* the hearing by the ear, the seeing by the eye, the smelling by the nose, the tasting by the tongue, and the touching by the skin.

Manas

XX. Next follows the will, which directs the senses in the exercise of their various functions, and which dwells in the heart. Therefore they call it *manas.*

Karmendriyani

XXI. XXV. The animal nature is rendered perfect by five *necessary functions,* which they call *karmendri-yani, i.e.* the senses of action. The former senses bring about learning and knowledge, the latter action and work. We shall call them the *necessaria...*

6. Belief in transmigration, Alberuni [6]

As *the word of confession,* "there is no god but God, Muhammad is his prophet," is the shibboleth of Islam, the Trinity that of Christianity, and the institute of the Sabbath that of Judaism, so metempsychosis is the shibboleth of the Hindu religion. Therefore he who does not believe in it does not belong to them, and is not reckoned as one of them. For they hold the following belief:

The soul, as long as it has not risen to the highest absolute intelligence, does not comprehend the totality of objects at once, or, as it were in no time. Therefore it must explore all particular beings and examine all the

possibilities of existence; and as their number is, though out unlimited, still an enormous one, the soul wants an enormous space of time in order to finish the contemplation of such a multiplicity of objects. The soul acquires knowledge only by the contemplation of the individuals and the species, and of their peculiar actions and conditions. It gains experience from each object, and gathers thereby new knowledge.

However, these actions differ in the same measure as the three primary forces differ. Besides, the world is not left without some direction, being led, as it were, by a bridle and directed towards a definite scope. Therefore the imperishable souls wander about in perishable bodies conformably to the difference of their actions, as they prove to be good or bad. The object of the migration through the world of *reward (i.e.* heaven) is to direct the attention of the soul to the good, that it should become desirous of acquiring as much of it as possible. The object of its migration through the world of *punishment (i.e.* hell) is to direct its attention to the bad and abominable, that it should strive to keep as far as possible aloof from it.

The migration begins from low stages, and rises to higher and better ones, not the contrary, as we state on purpose, since the one is *a priori* as possible as the other. The difference of these lower and higher stages depends upon the difference of the actions, and this again results from the quantitative and qualitative diversity of the temperaments and the various degrees of combinations in which they appear.

This migration lasts until the object aimed at has been completely attained both for the soul and matter; the *lower* aim being the disappearance of the shape of matter, except any such new formation as may appear desirable; the *higher* aim being the ceasing of the desire of the soul to learn what it did not know before, the insight of the soul into the nobility of its own being and its independent existence, its knowing that it can dispense with matter after it has become acquainted with the mean nature of matter and the instability of its shapes, with all that which matter offers to the senses, and with the truth of the tales about its delights. Then the soul turns away from matter; the connecting links are broken, the union is dissolved. Separation and dissolution take place, and the soul returns to its home, carrying with itself as much of the bliss of knowledge as sesame develops grains and blossoms, afterwards never separating from its oil. The intelligent being, intelligence and its object, are united and become one….

7. Ancient Greeks agreed in this belief, Alberuni[7]

The ancient Greeks agreed with the Hindus in this belief. Socrates says in the book *Phaedo:* "We are reminded in the tales of the ancients that the souls go from here to Hades, and then come from Hades to here; that the living originates from the dead, and that altogether things originate from their contraries. Therefore those who have died are among the living. Our souls lead an existence of their own in Hades. The soul of each man is glad or sorry at something, and contemplates this thing. This impressionable nature ties the soul to the body, nails it down in the body, and gives it, as it were, a bodily figure. The soul which is not pure cannot go to Hades. It quits the body still filled with its nature, and then migrates hastily into another body, in which it is, as it were, deposited and made fast. Therefore, it has no share in the living of the company of the unique, pure, divine essence…

As did Sufis

The same doctrine is professed by those Sufi who teach that this world is a sleeping soul and yonder world a soul awake, and who at the same time admit that God is immanent in certain places – *e.g.* in heaven – in the *seat* and the throne of God (mentioned in the *Koran*).

8. Greek views similar, Alberuni[8]

With regard to similar views of the ancient Greeks we can quote Ammonius, who relates the following as a sentence of Pythagoras: "Let your desire and exertion in this world be directed towards the union with *the First Cause,* which is the cause of the cause of your existence, that you may endure for ever. You will be saved from destruction and from being wiped out; you will go to the world of the true sense, of the true joy, of the true glory, in everlasting joy and pleasures."

Further, Pythagoras says: "How can you hope for the state of detachment as long as you are clad in bodies? And how will you obtain liberation as long as you are incarcerated in them?"

Ammonius relates: "Empedocles and his successor as far as Heracles *(sic)* think that the soiled souls always remain commingled with the world until they ask the universal soul for help. The universal soul intercedes for it with the *Intelligence,* the latter with the Creator. The Creator affords something of his light to Intelligence; Intelligence affords something of it to the

universal soul, which is immanent in this world. Now the soul wishes to be enlightened by Intelligence, until at last the individual soul recognises the universal soul, unites with it, and is attached to its world. But this is a process over which many ages must pass. Then the soul comes to a region where there is neither place nor time, nor anything of that which is in the world, like transient fatigue or joy."

Socrates says: "The soul on leaving space wanders to the holiness which lives for ever and exists eternally, being related to it. It becomes like holiness in duration; because it is by means of something like contact able to receive impressions from holiness. This, its susceptibility to impressions, is called *Intelligence.*"...

9. The four foundations [*asas*], Gardizi[9]

Thus says [Abu] 'Abdallah Jayhani: the Indians are divided into 99 divisions which can be reduced to 42 varieties, and their basic foundations are fourfold. With God's help, I shall explain these four foundations (*asas*):

(a) First come those affirming (the existence of) the Creator, may his majesty be exalted, and who believe in prophets, with regard to commands and interdictions, reward and punishment, that is to say that everyone finds reward or punishment to the measure of his works (*kirdar*).

(b) (The second are those who) reject the prophets; they are called Shamani (*i.e.* Buddhists).

(c) The third believe in God, may he be exalted, and in Paradise and Hell, saying that in going there they remain there for ever, for God's mercy and chastisement are uninterrupted.

(d) The fourth class say that reward and punishment consist in transmigration, either in happiness or in misfortune, and that Paradise and Hell are in proportion to one's achievements or sins; they are not eternal and when one has obtained a reward (*padash*) proportionate to one's deeds one comes out of them. These all are the saying of the Shamani who are (also) called Buddhists (*budi*).

10. Rules of readmission to the faith, Gardizi[10]

Whoever has left their religion is not readmitted except after he has made himself clean and they had purified him. The purification consists in shaving his head, his beard, his eyebrows and eye lashes, and any hair on his body. Then they collect five things: cow-dung, cow's urine, milk and

butter and Ganges water, and mix all five, giving them to him to drink in a copper bowl to the amount of one *ritl*. of the same water they pour on his head, after which they rub (*tala*) his body, and thus for ten days, in proportion to his rebellion and his neglect of religion. Then he approaches a cow and prostrates himself before her.

11. Variety of beliefs, Al-Idrisi[11]

Among the principal nations of India there are forty-two sects. Some recognise the existence of a Creator, but not of prophets; while others deny the existence of both. Some acknowledge the intercessory powers of graven stones, and others worship holy stones, on which butter and oil is poured. Some pay adoration to fire, and cast themselves into the flames. Others adore the sun, and consider it the creator and director of the world. Some worship trees; others pay adoration to serpents, which they keep in stables, and feed as well as they can, deeming this to be a meritorious work. Lastly, there are some who give themselves no trouble about any kind of devotion, and deny everything.

12. Worship individually, John of Monte Corvino[12]

They have no conscience of sin whatever. They have idol-houses in which they worship at almost all hours of the day; for they never join together in worship at any fixed hour, but each goes to worship when it pleases himself. And so they worship their idols in any part of these temples, either by day or by night. They frequently set forth their fasts and feasts, but they have no fixed recurring day to keep, either weekly or monthly.

13. Pray eastward, Athanasius Nikitin[13]

They offer their prayers towards the east, in the Russian way, lifting both hands high and putting them on the top of the head; then they lie down with the face to the ground, stretching their body to its full length, and such is their law…

Their Bootookhanies (places of worship) have no doors, and are situated towards the east; and the budhs (idols) also stand eastward.

B. Image worship

1. Beginning of image worship, Alberuni[14]

It is well known that the popular mind leans towards the sensible world, and has an aversion to the world of abstract thought which is only understood by highly educated people, of whom in every time and every place there are only few. And as common people will only acquiesce in pictorial representations, many of the leaders of religious communities have so far deviated from the right path as to give such imagery in their books and houses of worship, like the Jews and Christians, and, more than all, the Manicheans. These words of mine would at once receive a sufficient illustration if, for example, a picture of the Prophet were made, or of Mekka and the Ka'ba, and were shown to an uneducated man or woman. Their joy in looking at the thing would bring them to kiss the picture, to rub their cheeks against it, and to roll themselves in the dust before it, as if they were seeing not the picture, but the original, and were in this way, as if they were present in the holy places, performing the rites of pilgrimage, the great and the small ones.

This is the cause which leads to the manufacture of idols, monuments in honour of certain much venerated persons, prophets, sages, angels, destined to keep alive their memory when they are absent or dead, to create for them a lasting place of grateful veneration in the hearts of men when they die. But when much time passes by after the setting up of the monument, generations and centuries, its origin is forgotten, it becomes a matter of custom, and its veneration a rule for general practice. This being deeply rooted in the nature of man, the legislators of antiquity tried to influence them from this weak point of theirs. Therefore they made the veneration of pictures and similar monuments obligatory on them, as is recounted in historic records, both for the times before and after the Deluge. Some people even pretend to know that all mankind, before God sent them his prophets, were one large idolatrous body.

The followers of the Thora fix the beginning of idolatry in the days of Serugh, the great-grandfather of Abraham…

2. Ancient Greeks, Arabs and idol worship, Alberuni[15]

The ancient Greeks, also, considered the idols as mediators between themselves and the *First Cause,* and worshipped them under the names of the stars and the highest substances...When the heathen Arabs had imported

into their country idols from Syria, they also worshipped them, hoping that they would intercede for them with God.

SOME OF THE DEITIES WORSHIPPED

3. Maha-Kal, Gardizi[16]

They have an idol called Maha-Kal which has four hands and is sky-blue. He has much hair, his tusks come out and his belly is protruding, while on his back an elephant's skin is thrown from which blood is dripping. On his head and shoulders there are two snakes; in three of his hands he holds a snake, a skull, and a stick, while his fourth hand is raised towards his head. On his head he wears a crown made of skulls. They say that this was a demon (*div*) whom they worship in view of his exalted state, as he had many virtues and many vices. Therefore in India they build many temples (to him) and daily the adherents of their religion visit the temple, prostrate themselves before the (idol), and circumambulate him. They have a place called UJJAYN with a large idol representing (Maha-kal). They take before him their needs in this lower world and the world beyond and from him learn charms (*aza'im*). They do wonderful things saying that they all are from (Maha-Kal's) teaching. Men come before him and say: "give me this woman, or give me that thing." Some people come to worship him while for several days they refrain from food and humble themselves asking him for their needs. Some take an iron lamp and shaping its bottom like a spear place it on their palm and press it until it has pierced the palm and made a hole in it. Then they light the lamp and kneel down on both knees before the idol with lamentation saying: "accept from us our visit to this house".

4. Idol with special treasury, Gardizi[17]

The sect called DIVATRI have a custom to make an idol and to set it on a calf. Before it (or, for it: *az bar-i u*) they pitch a high tent (*qubba*). Then they pull the calf and people circumambulate it, striking cymbals and playing on stringed instruments. On that day all the courtesans (*qahba*) that be in the whole country assemble there. They sit on horses and elephants and bedeck themselves with many ornaments, men marching in from of them, and thus they circumambulate the idol. This happens in spring and when that day is over they carry the idol back to its place. The idol has a special treasury in which other idols are preserved in the shape of kings,

chiefs of various countries, and leaders of other sects. They have (other) idols shaped like horses, birds, and (grazing) animals. They display them on that day and around them people play, but when the festival is over, they take them all into the treasury.

5. Durga [?], Gardizi[18]

Another sect is called B.KTI. Their custom is to make an idol in the shape of a woman with a crown on her head. She has four hands: with one she touches a nail (*mikh*), with another she draws a sword, in the third she holds a *bajjar* (*vajra*), and in the fourth a *chakkar* (*chakra*), these two latter being Indian weapons. When the Sun reaches (the zodiac of) Libra (22nd September – 22nd October), they adorn this idol and before it place a throne (*takht*) on which they display whatever plants they can find and twigs of trees. And they bring together perfumes as well. Then they offer sacrifices: they bring buffaloes and sheep of various kinds placing grass before them that they may eat it. Whenever an animal raises its head they strike it with a sword in front of the idol and this is their sacrifice. Thus they carry on till the end of the festival. This is done by the commoners. As to their kinds, they find a man, red-haired and green-eyed. Then before the idol they fix a sharp chopper (*katara*) blade upwards, and tell the man to lay (his head) on the chopper. A man strikes him on the head so that the chopper penetrates up to the handle into his forehead and he dies on the spot (*dar sa at*). They say that in this way they acquire a great reward (*muzd*). At that moment they display great joy, entertain guests, and drink wine.

C. Some important temples

1. Temple at Multan, Abu Zaidu-l Hasan of Sira[19]

The idol called Multan is situated in the environs of Mansura, and people come on pilgrimages to it from many months distance. They bring thither the Indian aloes called *al kamruni,* from Kamrun, the name of the country in which it grows. These aloes are of the finest quality. They are given to the ministers of the temple for use as incense. These aloes are sometimes worth as much as two hundred dinars a *mana.* The aloes are so soft that they will receive the impression of a seal. Merchants buy them of the ministers of the temple.

2. The famous temple in Multan, Istakhari[20]

There is an idol there held in great veneration by the Hindus, and every year people from the most distant parts undertake pilgrimages to it, and bring to it vast sums of money, which they expend upon the temple and on those who lead there a life of devotion. The temple of the idol is a strong edifice, situated in the most populous part of the city, in the market of Multan, between the bazar of the ivory dealers and the shops of the coppersmiths. Theidol is placed under a cupola in the midst of the building and the ministers of the idol and those devoted to its service dwell around the cupola. In Multan there are no men either of Hind or Sind who worship idols except those who worship this idol and in this temple. The idol has a human shape, and seated with its legs bent in a quadrangular posture on a throne made of brick and mortar. Its whole body is covered with a red skin like Morocco leather, and nothing but its eyes are visible. Some believe that the body is made of wood, some deny this; but the body is not allowed to be uncovered to decide the point. The eyes of the idol are precious gems, and its head is covered with a crown of gold. It sits in a quadrangular position on the throne, its hands resting upon its knees, with the fingers closed, so that only four can be counted. When the Indians make war upon them and endeavour to seize the idol, the inhabitants bring it out, pretending that they will break it and burn it. Upon this the Indians retire, otherwise they would destroy Multan.

3. The idol at Multan, Alberuni[21]

A famous idol of theirs was that of Multan, dedicated to the sun, and therefore called *Aditya*. It was of wood and covered with red Cordovan leather; in its two eyes were two red rubies. It is said to have been made in the last Kritayuga. Suppose that it was made in the very end of Kritayuga, the time which has since elapsed amounts to 216,432 years. When Muhammad Ibn Alkasim Ibn Almunabbih conquered Multan, he inquired how the town had become so very flourishing and so many treasures had there been accumulated, and then he found out that this idol was the cause, for there came pilgrims from all sides to visit it. Therefore he thought it best to have the idol where it was, but he hung a piece of cow's-flesh on its neck by way of mockery. On the same place a mosque was built. When then the Karmatians occupied Multan, Jalam Ibn Shaiban, the usurper, broke the idol into pieces and killed its priests. He made his mansion, which was a castle

built of brick on an elevated place, the mosque instead of the old mosque, which he ordered to be shut from hatred against anything that had been done under the dynasty of the Caliphs of the house of 'Umayya. When afterwards the blessed Prince Mahmud swept away their rule from those countries, he made again the old mosque the place of the Friday worship, and the second one was left to decay. At present it is only a barn-floor, where bunches of Hinna (*lawsonia inermis*) are bound together.

4. Cakrasvamin temple at Thaneshwar, Alberuni[22]

The city of Taneshar is highly venerated by the Hindus. The idol of that place is called *Cakrasvamin, i.e.* the owner of the *cakra,* a weapon...It is of bronze, and is nearly the size of a man. It is now lying in the hippodrome in Ghazna, together with the *Lord of Somanath,* which is a representation of the *penis* of Mahadeva, called *Linga.* of Somanath we shall hereafter speak in the proper place. This Cakrasvamin is said to have been made in the time of Bharata as a memorial of wars connected with this name.

5. The idol of Sharda in Kashmir, Alberuni[23]

In Inner Kashmir, about two or three days' journey from the capital in the direction towards the mountains of Bolor, there is a wooden idol called *Sarada,* which is much venerated and frequented by pilgrims.

6. Somnath, Alberuni[24]

The Linga he [the moon] raised was the stone of Somanath, for *soma* means the moon and *natha* means *master,* so that the whole word means *master of the moon.* The image was destroyed by the Prince Mahmud – may God be merciful to him! – A.H. 416. He ordered the upper part to be broken and the remainder to be transported to his residence, Ghaznin, with all its coverings and trappings of gold, jewels, and embroidered garments. Part of it has been thrown into the hippodrome of the town, together with the *Cakrasvamin,* an idol of bronze, that had been brought from Taneshar. Another part of the idol from Somanath lies before the door of the mosque of Ghaznin, on which people rub their feet to clean them from dirt and wet…

The educated Hindus determine the daily phases of the tides by the rising and setting of the moon, the monthly phases by the increase and waning of the moon; but the physical cause of both phenomena is not understood by them.

It is flow and ebb to which Somanath owes its name *(i.e.* master of the moon); for the stone (or *linga)* of Somanath was originally erected on the coast, a little less than three miles west of the mouth of the river Sarsuti, east of the golden fortress Baroi, which had appeared as a dwelling-place for Vasudeva, not far from the place where he and his family were killed, and where they were burned. Each time when the moon rises and sets, the water of the ocean rises in the flood so as to cover the place in question. When, then, the moon reaches the meridian of noon and midnight, the water recedes in the ebb, and the place becomes again visible. Thus the moon was perpetually occupied in serving the idol and bathing it. Therefore the place was considered as sacred to the moon. The fortress which contained the idol and its treasures was not ancient, but was built only about a hundred years ago…

The fact that the just-mentioned fortress is said to have appeared out of the ocean is not astonishing for that particular part of the ocean; for the Dibajat islands (Maledives and Laccadives) originate in a similar manner, rising out of the ocean as sand-downs….

7. Somnath, Zakariya Al Kazwini[25]

Somnat – A celebrated city of India, situated on the shore of the sea, and washed by its waves. Among the wonders of that place was the temple in which was placed the idol called Somnat. This idol was in the middle of the temple without anything to support it from below, or to suspend it from above. It was held in the highest honour among the Hindus, and whoever beheld it floating in the air was struck with amazement, whether he was a Musulman or an infidel. The Hindus used to go on pilgrimage to it whenever there was an eclipse of the moon, and would then assemble there to the number of more than a hundred thousand. They believed that the souls of men used to meet there after separation from the body, and that the idol used to incorporate them at its pleasure in other bodies, in accordance with their doctrine of transmigration. The ebb and flow of the tide was considered to be the worship paid to the idol by the sea. Everything of the most precious was brought there as offerings, and the temple was endowed with more than 10,000 villages. There is a river (the Ganges) which is held sacred, between which and Somnat the distance is 200 parasangs. They used to bring the water of this river to Somnat every day, and wash the

temple with it. A thousand brahmans were employed in worshipping the idol and attending on the visitors, and 500 damsels sung and danced at the door – all these were maintained upon the endowments of the temple. The edifice was built upon fifty-six pillars of teak, covered with lead. The shrine of the idol was dark; but was lighted by jewelled chandeliers of great value. Near it was a chain of gold weighing 200 mans. When a portion (watch) of the night closed, this chain used to be shaken like bells to rouse a fresh lot of brahmans to perform worship. When the Sultan Yaminu-d Daula Mahmud bin Subuktigin went to wage religious war against India, he made great efforts to capture and destroy Somnat, in the hope that the Hindus would then become Muhammadans. He arrived there in the middle of Zi-l k'ada, 416 A.H. (December, 1025 A.D.). The Indians made a desperate resistance. They would go weeping and crying for help into the temple, and then issue forth to battle and fight till all were killed. The number of the slain exceeded 50,000. The king looked upon the idol with wonder, and gave orders for the seizing of the spoil, and the appropriation of the treasures. There were many idols of gold and silver and vessels set with jewels, all of which had been sent there by the greatest personages in India. The value of the things found in the temples of the idols exceeded twenty thousand thousand dinars. When the king asked his companions what they had to say about the marvel of the idol, and of its staying in the air without prop or support, several maintained that it was upheld by some hidden support. The king directed a person to go and feel all around and above and below it with a spear, which he did, but met with no obstacle. One of the attendants then stated his opinion that the canopy was made of loadstone, and the idol of iron and that the ingenious builder had skillfully contrived that the magnet should not exercise a greater force on anyone side – hence the idol was suspended in the middle. Some coincided, others differed. Permission was obtained from the Sultan to remove some stones from the top of the canopy to settle the point. When two stones were removed from the summit the idol swerved on one side, when more were taken away it inclined still further until at last it rested on the ground.

8. The attack on Somnath by Alauddin Khalji, Abdullah Wassaf[26]

When Sultan 'Alau-d din, the Sultan of Delhi, was well established in the centre of his dominion, and had cut off the heads of his enemies and slain

them, and had imparted rest to his subjects from the fountain of his kindness and justice, the vein of the zeal of religion beat high for the subjection of infidelity and destruction of idols, and in the month of Zi'l-hijja 698 H. (1298 A.D.) his brother Malik Mu'izzu-d din and Nusrat Khan, the chief pillar of the state and the leader of his armies, a generous and intelligent warrior, were sent to Kambayat, the most celebrated of the cities of Hind in population and wealth. Its air is pure, its water clear, and the circumjacent country beautiful and charming both in scenery and buildings. With a view to holy war, and not for the lust of conquest, he enlisted under their banners about 14,000 cavalry and 20,000 infantry, which, in their language, are called *dakk.*

They went by daily marches through the hills, from stage to stage, and when they arrived at their destination at early dawn they surrounded Kambayat, and the idolaters were awakened from their sleepy state of carelessness and were taken by surprise, not knowing where to go, and mothers forgot their children and dropped them from their embrace. The Muhammadan forces began to "kill and slaughter on the right and on the left unmercifully, throughout the impure land, for the sake of Islam," and blood flowed in torrents. They plundered gold and silver to an extent greater than can be conceived, and an immense number of brilliant precious stones, such as pearls, diamonds, rubies, and emeralds, etc., as well as a great variety of cloths, both silk and cotton, stamped, embroidered, and coloured.

They took captive a great number of handsome and elegant maidens, amounting to 20,000, and children of both sexes, "more than the pen can enumerate," and thirteen enormous elephants, whose motions would put the earth in tremor." In short, the Muhammadan army brought the country to utter ruin, and destroyed the lives of the inhabitants, and plundered the cities, and captured their offspring, so that many temples were deserted and the idols were broken and trodden under foot, the largest of which was one called Somnat, fixed upon stone, polished like a mirror, of charming shape and admirable workmanship. It stood seven yards high. Its position was such as if it was about to move, and its expression such as if it was about to speak. If the introducer of idolatry were to look on it he would become enamoured of its beauty. The infidels objected to people going near it. Its head was adorned with a crown set with gold and rubies and pearls and

other precious stones, so that it was impossible for the eyes to trace the redness of the gold on account of the excessive lustre of the jewels, and a necklace of large shining pearls, like the belt of Orion, depended from the shoulder towards the side of the body.

The Muhammadan soldiers plundered all those jewels and rapidly set themselves to demolish the idol. The surviving infidels were deeply affected with grief, and they engaged "to pay a thousand pieces of gold" as a ransom for the idol, but they were indignantly rejected, and the idol was destroyed, and "its limbs, which were anointed with ambergris and perfumed, were cut off. The fragments were conveyed to Delhi, and the entrance of the Jami' Masjid was paved with them, that people might remember and talk of this brilliant victory." "Praise be to God, the Lord of the worlds. Amen!"

After some time, among the ruins of the temples, a most beautiful jasper-coloured stone was discovered, on which one of the merchants had designed some beautiful figures of fighting men and other ornamental figures of globes, lamps, etc., and on the margin of it were sculptured verses from the Kuran. This stone was sent as an offering to the shrine of the pole of saints, Shaikh Murshid Abu Is'hak Ibrahim bin Shahriar. At that time they were building a lofty octagonal dome to the tomb. The stone was placed at the right of the entrance. "At this time, that is, in the year 707 H. (1307 A.D.), 'Alau-d din is the acknowledged Sultan of this country. On all its borders there are infidels, whom it is his duty to attack in the prosecution of a holy war, and return laden with countless booty."

9. Idol gives response from its mouth, Odoric of Pordenone[27]

They worship also another idol, which is half man and half ox. And this idol giveth responses out of its mouth, and ofttimes demandeth the blood of forty virgins to be given to it. For men and women there vow their sons and their daughters to that idol, just as here they vow to place them in some religious order. And in this manner many perish…

10. A wonderful idol at Malabar, Odoric of Pordenone[28]

There is likewise in this kingdom [Mabar] a certain wonderful idol, which all the provinces of India greatly revere. It is as big as St. Christopher is commonly certain represented by the painters, and it is entirely of gold, seated on a great throne, which is also of gold. And round its neck it hath a

collar of gems of immense value. And the church of this idol is also of pure gold, roof (and walls) and pavement. People come to say their prayers to the idol from great distances, just as Christian folk go from far on pilgrimage to St. Peter's. And the manner of those who come is thus:- Some travel with a halter round their necks; and some with their hands upon a board, which is tied to their necks; others with a knife stuck in the arm, which they never remove until they arrive before the idol, so that the arm is then all in a slough. And some have quite a different way of doing. For these as they start from their houses take three steps, and at the fourth they make a prostration at full length upon the ground. And then they take a thurible and incense the whole length of that prostration. And thus they do continually until they reach the idol, so that sometimes when they go through this operation it take a very great while before they do reach the idol. But when those who are going along in this way wish to turn aside to do anything, they make a mark there to show how far they have gone, and so they (come back upon this, and) continue until they reach the idol.

11. Idol taken out in procession, Nicolo Conti[29]

In Bizenegalia also, at a certain time of the year, their idol is carried through the city, placed between two chariots, in which are young women richly adorned, who sing hymns to the god, and accompanied by a great concourse of people. Many, carried away by the fervour of their faith, cast themselves on the ground before the wheels, in order that they may be crushed to death, a mode of death which they say is very acceptable to their god. Others, making an incision in their side, and inserting a rope thus through their body, hang themselves to the chariot by way of ornament, and thus suspended and half dead accompany their idol. This kind of sacrifice they consider the best and most acceptable of all.

12. Vasco da Gama's delegation mistakes a temple for a church[30]

When we arrived [at Calicut] they took us to a large church, and this is what we saw:–

The body of the church is as large as a monastery, all built of hewn stone and covered with tiles. At the main entrance rises a pillar of bronze as high as a mast, on the top of which was perched a bird, apparently a cock. In addition to this, there was another pillar as high as a man, and very stout. In the centre of the body of the church rose a chapel all built of hewn stone,

with a bronze door sufficiently wide for a man to pass, and stone steps leading up to it. Within this sanctuary stood a small image which they said represented Our Lady. Along the walls, by the main entrance, hung seven small bells. In this church the captain-major said his prayers, and we with him.

We did not go within the chapel, for it is the custom that only certain servants of the church, called *quafees* [Brahmin priests], should enter. These *quafees* wore some threads passing over the left shoulder and under the right arm, in the same manner as our deacons wear the stole. They threw holy water over us, and gave us some white earth, which the Christians of this country are in the habit of putting on their foreheads, breasts, around the neck, and on the forearms. They threw holy water upon the captain-major and gave him some of the earth, which he gave in charge of someone, giving them to understand that he would put it on later.

Many other saints were painted on the walls of the church, wearing crowns. They were painted variously, with teeth protruding an inch from the mouth, and four or five arms.

Below this church there was a large masonry tank, similar to many others which we had seen along the road.

D. Popular pilgrimage sites

1. Holy ponds, Alberuni[31]

We have already quoted Hindu traditions to the effect that in the Dvipas there are rivers as holy as the Ganges. In every place to which some particular holiness is ascribed, the Hindus construct ponds intended for the ablutions. In this they have attained to a very high degree of art, so that our people (the Muslims), when they see them, wonder at them, and are unable to describe them, much less to construct anything like them. They build them of great stones of an enormous bulk, joined to each other by sharp and strong crampirons, in the form of steps (or terraces) like so many ledges and these terraces run all around the pond, reaching to a height of more than a man’s stature. On the surface of the stones between two terraces they construct staircases rising like pinnacles. Thus the first steps or terraces are like roads (leading round the pond), and the pinnacles are steps (leading up and down). If ever so many people descend to the pond whilst others

ascend, they do not meet each other, and the road is never blocked up, because there are so many terraces, and the ascending person can always turn aside to another terrace than that on which the descending people go. By this arrangement all troublesome thronging is avoided.

In Multan there is a pond in which the Hindus worship by bathing themselves, if they are not prevented.

The Samhita of Varahamihira relates that in Taneshar there is a pond which the Hindus visit from afar to bathe in its water. Regarding the cause of this custom they relate the following:The waters of all the other holy ponds visit this particular pond at the time of an eclipse. Therefore, if a man washes in it, it is as if he had washed in every single one of all of them…

2. Banaras, Alberuni[32]

The Hindus have some places which are venerated for reasons connected with their law and religion, e.g. Benares. For their anchorites wander to it and stay there for ever as the dwellers of the Ka'ba stay for ever in Mekka. They want to live there to the end of their lives, that their reward after death should be the better for it. They say that a murderer is held responsible for his crime and punished with a punishment due to his guilt, except in case he enters the city of Benares, where he obtains pardon.

3. Pushkar, Alberuni[33]

A similar place is Pukara…Outside the town, in three places, they have constructed ponds which stand in high veneration, and are places of worship.

4. Thaneshwar, Alberuni[34]

Another place of the kind is Taneshar, also called Kurukshetra, *i.e.* the land of Kuru, who was a peasant, a pious, holy man, who worked miracles by divine power. Therefore the country was called after him, and venerated for his sake. Besides, Taneshar is the theatre of the exploits of Vasudeva in the wars of Bharata and of the destruction of the evildoers. It is for this reason that people visit the place.

5. Mathura, Alberuni[35]

Mahura, too, is a holy place, crowded with Brahmans. It is venerated because Vasudeva was there born and brought up, in a place in the neighbourhood called Nandagola.

6. Kashmir and Multan, Alberuni[36]

Nowadays the Hindus also visit Kashmir. Lastly, they used to visit Multan before its idol-temple was destroyed.

7. Hardwar, Yazdi[37]

The valley of Kupila is situated at the foot of a mountain by which the river Ganges passes. Fifteen *kos* higher up there is a stone in the form of a cow, and the water of the river flows out of the mouth of that cow. The infidels of India worship this cow; and come hither from all quarters, from distances even of a year's journey, to visit it. They bring here and cast into the river the ashes of their dead whose corpses have been burned, believing this to be the means of salvation. They throw gold and silver into the river; they go down alive into the river, bathe their feet, sprinkle water on their heads, and have their heads and beards shaved. This they consider to be an act of devotion, just as the Muhammadans consider the pilgrimage to Mecca a pious work.

E. Certain other Customs

1. Ganges washes sins, Gardizi[38]

Another group are the GANGAYATRI. They are found at any place in India. Their law is that anyone who has committed a sin which would offend his parents, or (any other) wicked deed, wherever he be of the far or near places of India, he travels from there to the Ganges and washes himself in its water, and this is the purification (*kaffara*) of his sin. Should he die on that journey, this too will be accepted from him.

2. Water worshipped, Gardizi[39]

Another sect is called JALA-BHAKTI, *i.e.* 'water –worshippers'. They say that on the waters there is an angel and water is the origin of all plants and animals. It is the origin of life: wherever it be plentiful, there plants, the breeding of animals and the prosperity of the world are on the increase. A man (of theirs) enters the water up to his waist and stays there (*andar u*) for more than two hours. He holds sweet basil (*sipargham*) in his hands and splits it into small pieces (*para*) which he throws into the water as he swims (*ashna*) and sings something. When he wants to retire he stirs the water with his hand and scooping up a little pours it over his head and the parts of

the body which are not submerged. Then he goes, after a prostration before the water.

3. Fire worshipped Gardizi[40]

Another sect is called AGNI-HOTRI, *i.e.* 'fire worshippers'. According to them Fire is the greatest of the elements and substances. Whoever burns himself in it purifies himself of all impurities (*palidiha*), while the fire becomes exalted (*buzurg*). They make a quadrangular hole in which they kindle a great fire. Then they bring food, garments, gold, silver, precious stones, cereals (*dangu*), and perfumes and throw them into the flames, as they circumambulate them. Great kings belong to this sect.

4. Moon worshipped, Gardizi[41]

Another sect is called CHANDRA-BHAKTI (spelt *J.ndr.rbhaktiyan*), *i.e.* 'Moon-worshippers'. According to them the Moon is one of the great angels. of him they have made an idol seated on a calf. Before him are four (other) idols. In his hand he holds a jewel. Every month these people fast for half a month (or, during the middle of the month?). They do not break their fast until the new moon appears. And when the moon rises they go up on the roofs, sprinkle perfumes, and look at the moon with pleasant faces. Then they come down to their homes, break the fast, and go before the idols stamping their feet and playing.

5. Sun worshipped, Gardizi[42]

Another sect is called ADITYA-BHAKTI (spelt *Awbhaktiyan*), *i.e.* 'Sun-worshippers'. They have made an idol seated on a calf. Four horses are harnessed to (the idol) and before the idol there is an angel whom they worship prostrating themselves before him, burning incense and playing the flute and striking cymbals. The idol has numerous estates and much grain. And they tell many stories about this idol. The sick come and fast before him for a day and a night, which they call *lak-han*, (hoping to) dream a dream, (after which) they are told that their wish has been fulfilled, and break their fast. There were two of these idols but Amir Mahmud, God have mercy on his soul, pulled down one of them, and the other still exists in Hindustan.

6. Throwing self before chariot, Odoric of Pordenone[43]

And hard by the church of this idol there is a lake, made by hand, into which the pilgrims who come thither cast gold or silver or precious stones, in honour of the idol, and towards the maintenance of the church, so that much gold and silver and many precious stones have been accumulated therein. And thus when it is desired to do any work upon the church, they make search in the lake and find all that hath been cast into it.

But annually on the recurrence of the day when that idol was made, the folk of the country come and take it down, and put it in a fine chariot; and then the king and queen and all the pilgrims, and the whole body of the people, join together and draw forth from the church with loud singing of songs and all kinds of music; and many maidens go before it by two and two chanting in a marvellous manner. And many pilgrims who have come to this feast cast themselves under the chariot, so that its wheels may go over them, saying that they desire to die for their God. And the car passes over them, and crushes and cuts them in sunder, and so they perish on the spot. And after this fashion they drag the idol to a certain customary place, and then they drag him back to where he was formerly, with singing and playing as before. And thus not a year passes but there perish more than five hundred men in this manner; and their bodies they burn, declaring that they are holy, having thus devoted themselves to death for their God.

And another custom they have of this kind. One will come saying: "I desire to sacrifice myself for my God?" And then his friends and kinsfolk, and all the players of the country, assemble together to make a feast for him who is determined to die for his God. And they hang round his neck five very sharp knives, and lead him thus to the presence of the idol with loud songs. Then he takes one of those sharp knives and calls out with a loud voice: "Thus I cut my flesh for my God"; and cutting a piece of his flesh wherever he may choose, he casteth it in the face of the idol; and saying again: "I devote myself to die for my God," he endeth by slaying himself there. And straightway they take his body and burn it, for they look on him as a saint, having thus slain himself for his idol. And many other things greatly to be marvelled at are done by these people, which are by no means to be written.

7. Self-immolation in India the Greater, Friar Jordanus[44]

In this Greater India many sacrifice themselves to idols in this way. When they are sick, or involved in any grave mischance, they vow themselves to the idol if they should happen to be delivered. Then, when they have recovered, they fatten themselves for one or two years continually, eating and drinking fat things, etc. And when another festival comes round, they cover themselves with flowers and perfumes, and crown themselves with white garlands, and go with singing and playing before the idol when it is carried through the land (like the image of the Virgin Mary here among us at the Rogation tides); and those men who are sacrificing themselves to the idol carry a sword with two handles, like those (knives) which are used in currying leather; and, after they have shown off a great deal, they put the sword to the back of the neck, cutting strongly with a vigorous exertion of both hands, and so cut off their own heads before the idol.

8. Drowning in the Ganges, Ibn Battuta[45]

The Indians have a similar practice of drowning themselves and many of them do so in the river Ganges, the river to which they go on pilgrimage, and into which the ashes of those who are burned are cast. They say that it is a river of Paradise. When one of them comes to drown himself he says to those present with him, "Do not think that I drown myself for any worldly reason or through penury; my purpose is solely to seek approach to Kusay," Kusay [Krishna?] being the name of God in their language. He then drowns himself, and when he is dead they take him out and burn him and cast his ashes into this river.

9. Tulsi sacred, Odoric of Pordenone[46]

In this country every man hath before his house a plant of twigs as thick as a pillar would be here, and this never withers as long as it gets water. And many other strange things are there which it would be pretty to hear, tell.

F. Cow worship

1. Love of animals, cows sacred, Al-Idrisi[47]

The inhabitants of Nahrwara…have a great veneration for oxen, and by a privilege confined to the species, they inter them after death. When these animals are enfeebled by age, and are unable to work, they free them from all labour and provide them with food without exacting any return.

2. Oxen sacred, John of Monte Corvino[48]

Oxen are with these people sacred animals, and they eat not their flesh for the worship they bear them. But they make use of cows' milk, and put their cattle to labour like other folk.

3. Worship of ox, Marco Polo[49]

The greater part of the idolatrous inhabitants of this kingdom show particular reverence to the ox; and none will from any consideration be induced to eat the flesh of oxen. But there is a particular class of men termed gaui, who although they may eat of the flesh, yet dare not to kill the animal; but when they find a carcass, whether it has died a natural death or otherwise, the gaui eat of it; and all descriptions of people daub their houses with cow-dung.

4. Hair of a wild bull prized, Marco Polo[50]

Those amongst them who pay adoration to the ox, take with them, when they go to battle, some of the hair of a wild bull, which they attach to the manes of their horses, believing its virtue and efficacy to be such, that every one who carries it about with him is secure from all kind of danger. On this account the hair of the wild bull sells for a high price in these countries.

5. People at Polumbum [Kulam] worship of ox, Odoric of Pordenone[51]

All the people of this country worship the ox for their god [and they eat not his flesh]; for they say that he is, as it were, a sacred creature. Six years they make him to work for them, and the seventh year they give him rest from all labour, and turn him out in some appointed public place, declaring him thenceforward to be a consecrated animal. And they observe the following abominable superstition. Every morning they take two basins of gold or silver, and when the ox is brought from the stall they put these under him and catch his urine in one and his dung in the other. With the former they wash their faces and with the latter they daub themselves, first on the middle of the forehead; secondly, on the balls of both cheeks; and lastly in the middle of the chest. And when they have thus anointed themselves in four places they consider themselves to be sanctified (for the day). Thus do the common people; and thus do the king and queen likewise.

6. Cow holy in India the Less, Friar Jordanus[52]

The Indians, both of this India and of the other Indies, never kill an ox, but rather honour him like a father; and some, even perhaps the majority, worship him. They will more readily spare him who has slain five men than him who has slain one ox, saying that it is no more lawful to kill an ox than to kill one's father. This is because oxen do all their services, and moreover furnish them with milk and butter, and all sorts of good things. The great lords among the idolaters, every morning when they rise, and before they go anywhither, make the fattest cows come before them, and lay their hands upon them, and then rub their own faces, believing that after this they can have no ailment.

7. Sacredness of cow, Abder Razzak[53]

In this harbour [Calicut] one may find everything that can be desired. One thing alone is forbidden, namely, to kill a cow, or to eat its flesh: whosoever should be discovered slaughtering or eating one of these animals, would be immediately punished with death. So respected is the cow in these parts, that the inhabitants take its dung when dry and rub their foreheads with it.

8. Worship cow at Calicut, Hieronimo di Santo Stefano[54]

The lord of the city is an idolater, and so likewise are all the people. They worship an ox, or the sun, and also various idols, which they themselves make. When these people die they are burnt: their customs and usages are various; inasmuch as some kill all kinds of animals excepting oxen and cows: if any one were to kill or wound these, he would be himself immediately slain, because, they are objects of worship. Others, again, never eat flesh or fish, or anything that has had life.

G. Ascetics

1. Wandering mendicants, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[55]

There are some people in India who are dedicated to a life of wandering in the forests and the mountains. They seldom communicate with human beings, and sometimes eat the herbs and fruits of the forests. They wear iron rings through their penis, so that they may not be able to cohabit with women. There are some others who are naked. Then some of them set themselves up towards the sun and encounter in naked except that they put on something made of the leopard skin. I saw one of these men just as I

described and then departed. After sixteen years, I returned once again and [to my surprise] I found him in the same state [as I had left him in]. I was surprised that his eyes did not melt away due to the heat of the sun.

2. The Bhadruri, Gardizi[56]

Another sect are the BHADRURI (?)…Their law is to keep the hair long, letting it down straight from every side so that they look out from underneath that hair. They wear vests (*sidra*), letting their hands out of (?) their sleeves and keeping their chests uncovered. Round their waists they attach chains and each is accompanied by another man who holds him by that chain. They do not drink wine. Their pilgrimage is to a mountain called Chun-ghar (Junagarh?). They repair thither to lament (*nauha* for *tavajjuh*) Bhadruz (*sic*). They occupy that mountain and on it they have built a large house (on which) they have represented (*nigashta*) Bhadruz on a horse. This building has a door on entering which they tie up their mouths, lest their breath should touch the idol's body. There they perform sacrifices. When these men visit other countries they tell the stories on which their creed is based, and in the meantime they nod. Apart from that house they have other houses they have other houses (in which) the likeness of Bhadru (*sic*) and his two brothers JUN and M.RS are represented, and idols are found (in them), but they venerate that house on Mt. Junghar (above all).

3. Munis, Gardizi[57]

Another sect is that called MUNI, *i.e.* 'the silent'. They do not harm or pain anybody, and do not speak to anyone (*har kas*). They eat what food they can find, except meat, and do not marry.

4. The Kesa-karti [Jain munis?], Gardizi[58]

Another sect is called K.STK.RTI [*kesa-karti*, cutting hair] and SID.R. They are naked and cover only their privy parts. On their necks they wear a staff, and suspended on it are a gourd in which there is everything and also a bag (*kharita*) with food. In the other (?) hand they hold a fan of peacock's feathers. These people like discussions (*ahl-I jadal?*). With each of them comes a disciple. They have chairs on which they sit and all day long they have no other business but to pluck hair out of their heads, brows, eyelashes, and limbs. By that they intend to mortify (*adhab*) their body. They say that there was a king who was attracted towards their religion. So

they bared his body and said: “all this hair has to be plucked out and while this is done thou must not shout but only say: ‘o comfort’ (*ay rahata*). When much of it was plucked out and the operation became painful, he shouted and they said: “thou hast spoilt thy business”. He became silent and kept saying (*be-guftan istad*): ‘o comfort’. They said: “if thou goest on saying like this till all thy hair is gone thou shalt enter paradise”. As they went on with their operation he felt great pain and could stand it no more. So he withdrew himself from their hands and returned to his own status and religion. When asked about the reason, he answered: “one must flee from a religion whose very beginning [i.e., the declaration ‘o comfort’] is a lie”.

5. Those who burn themselves, Gardizi[59]

Among them there are people who burn themselves in the fire, doing this in the following way. They dig a ditch near a water, and fill it with burning stuff (*atash*). That man (of theirs) comes and fumigates himself, prostrates himself before everybody, and throws himself into the ditch. When he is on fire he comes out and entering the water plunges into it for so long that he is nearly dead. Then entering the fire and water alternately he goes on until he dies. Should he die in the fire or in the water, they proclaim him one of Paradise, but should he die between the two they become afflicted (*tafta*) and say: “he has not reached Paradise.”

6. Other forms of asceticism, Gardizi[60]

Some heat stones and collecting them while they are very hot place these burning pieces of stone on the belly (of the man who wishes to undergo the test) until a hole appears in his belly and his bowels (*rudagan*) fall out and he dies. Some others kindle four fires and stand in the middle holding one foot in one hand and resting on the other; and thus they remain until they are on fire and the contents of their entrails (*rudab*) spurt from them and finally they fall of weakness and die being consumed by the fire.

Some carve pieces out of their thighs and flesh and cutting them into (small) slices throw them into the fire, while singing some of those incantations (*khwanish*). Men gather round such a man, praise him, incite him (to seek) his reward (*muzd*), and pray that the Almighty grant them the same rank. Thus they go on until the man dies…

Starve to death

Others again who kill themselves by hunger and thirst are called ANSHI [not eating]. Some die on the twentieth day and some survive to thirty days. First they are unable to walk, then to sit, then to utter a word, then their sense are annihilated and they become like blocks of dry wood and finally they grow motionless and numb (*bi-y-afsurand*).

The Trisuli

A sect called TRISULI has the following custom. There is a tree named *batu* [banyan] whose nature is such that coming out of the soil it grows up and then long twigs shoot out of it in every direction, and reaching the soil take root and grow up again and again. Left alone they would cover the province, but some (of the twigs) are pruned and some set fire to, so that it should acquire more strength. The people of this creed have a place where the waters of the River Ganges flow together. There stands a huge tree widespreading (*pahn baz-shuda*). Under it they have fixed something which they call *trisul* 'trident'. It is made of iron and like a stake driven into (the soil), raising above the level of the river several tens of cubits (*chand dah rash*). It is hard as the hardest wood. Its top forms three branches, each long, hard, sharpened, and neatly polished, so that it shines like fire. A man sits by the course of the river (*az gudhara-yi ab*), close to the tree, reading a book and addressing the River Ganges: "O (*ya?*) great one, either return, or (show) the road of Paradise! Thou art a stream coming from the center of Paradise and showing to the men the road thereunto (*bad-u hami rah numa'i*). Blessed is he who climbs on to the tree and throws himself on that stake." And the people there listen to it, and one of them climbs on to the tree, flings himself on to the stake, cuts himself to pieces on its blades, and falls into the river. And the people who are there pray for him and say: "he is gone to Paradise".

7. On the banks of rivers, Gardizi[61]

There is a sect [lacuna] whose habit is to assemble daily on the spot where the Ganges unites (*grid shaved*) with the Yamuna (*Jaun*). Each brings a weapon as sharp as a sword, a dagger, or such like. One of these devotees who wishes to purify himself and seeks approach to God, comes near those people and they throw upon him whatever they have of garments, ornaments, golden necklaces, bracelets, and such like, and they set upon him with all their sharp weapons, slay him and cut him in two: they throw

one part into the Ganges and the other into the Yamuna saying: "let these two streams take him to Paradise."

8. Next world revealed to Hindu ascetics, al-Shahrastani[62]

[Hindu ascetics separate imagination from their physical environment and achieve considerable self-subjugation] so that when meditation becomes emancipated from this world, the next world is revealed to it.

9. Self-immolation practices, Benjamin of Tudela[63]

Some of the great of this country take a vow to burn themselves alive; and if any such devotee declares to his children and kindred his intention to do so, they all applaud him and say: 'Happy shalt thou be, and it shall be well with thee.'…Whenever the appointed day arrives, they prepare a sumptuous feast, mount the devotee upon his horse if he be rich, or lead him afoot if he be poor, to the brink of the ditch. He throws himself into the fire, and all his kindred manifest their joy by the playing of instruments until he is entirely consumed. Within three days of this ceremony two of their principal priests repair to his house and thus address his children: 'Prepare the house, for today you will be visited by your father who will manifest his wishes unto you.' Witnesses are selected among the inhabitants of the town, and the devil appears in the image of the dead. The wife and children inquire after his state in the other world, and he answers: 'I have met my companions, but they have not admitted me into their company before I have discharged my debts to my friends and neighbours.' He then makes a will, divides his goods among his children, and commands them to discharge all debts he owes and to receive what people owe him; this will is written down by the witnesses...and he is not seen anymore. In the consequence of these lies and deceit, which the priests pass off as magic, they retain a stronghold upon the people, and make them believe that their equal is not to be met with upon earth.

10. Devoted to religious life, Marco Polo[64]

Amongst the natives of this region there is a class peculiarly devoted to a religious life, who are named *tingui,* and who in honour of their divinities lead most austere lives. They go perfectly naked, not concealing any part of their bodies, and say there can be no shame in that state of nudity in which they came into the world; and with respect to what are called the parts of shame, they observe that, not being with them the organs of sin, they have

no reason to blush at their exposure. They pay adoration to the ox, and carry a small figure of one, of gilt brass or other metal, attached to their foreheads. They also burn the bones of oxen, reduce them to powder, and with this make an unguent for the purpose of marking various parts of the body, which they do in a reverential manner. If they meet a person with whom they are upon cordial terms, they smear the centre of his forehead with some of these prepared ashes. They do not deprive any creature of life, not even a fly, a flea, or a louse, believing them to be animated with souls; and to feed upon any animal they would consider as a heinous sin. They even abstain from eating vegetables, herbs, or roots, until they have become dry; holding the opinion that these also have souls. They make no use of spoons nor of platters, but spread their victuals upon the dried leaves of the Adam's apple, called like-wise apples of paradise. When they have occasion to ease nature, they go to the sea-beach, and having dropped their burden in the sand, immediately scatter it in all directions, to prevent its giving birth to vermin, whose consequent death by hunger would load their consciences with a grievous offence. They live to great age, some of them even to a hundred and fifty years, enjoying health and vigour, although they sleep upon the bare earth. This must be attributed to their temperance and chastity. When they die, their bodies are burned, in order for the same reason that they might not breed worms.

11. Yogis at Narwar, Gwalior, Ibn Battuta[65]

The men of this class do some marvellous things. One of them will spend months without eating or drinking, and many of them have holes dug for them in the earth which are then built in on top of them, leaving only a space for air to enter. They stay in these for months, and I heard tell of one of them who remained thus for a year. The people say that they make up pills, one of which they take for a given number of days or months, and during that time they require no food or drink. They can tell what is happening at a distance. The sultan holds them in esteem and admits them to his company. Some eat nothing but vegetables, and others, the majority, eat no meat; it is obvious that they have so disciplined themselves in ascetic practices that they have no need of any of the goods or vanities of this world.

12. Yogis with the Sultan, Ibn Battuta[66]

The sultan sent for me once when I was at Delhi, and on entering I found him in a private apartment with some of his intimates and two of these *jugis*. One of them squatted on the ground, then rose into the air above our heads, still sitting. I was so astonished and frightened that I fell to the floor in a faint. A potion was administered to me, and I revived and sat up. Meantime this man remained in his sitting posture. His companion then took a sandal from a bag he had with him, and beat it on the ground like one infuriated. The sandal rose in the air until it came above the neck of the sitting man and then began hitting him on the neck while he descended little by little until he sat down alongside us. Then the sultan said, "If I did not fear for your reason I would have ordered them to do still stranger things than this you have seen." I took my leave but was affected with palpitation and fell ill, until he ordered me to be given a draught which removed it all.

13. Ascetics, Yefrosin, the fifteenth century writer[67]

[They have] neither iron nor temples, nor gold, nor wine, they eat no meat, have no ruler, no buying, they live naked, eat a few vegetables, drink sweet water, ardently believe in God and pray continuously.

H. On Buddhism

1. Some Chinese inscriptions at Bodhgaya[68]

(a) The inscription of the monk Che-Yi, circa A.D. 990

The monk Che-yi of the great Han country had first taken the vow to exhort three hundred thousand men to practise the conduct which assures a higher birth; to make a charity of three hundred thousand copies of *Shan Shen King* (Sutra relating to the higher birth) and to recite it himself three hundred thousand times. Such a merit, as mentioned above, conduces to the birth in the inner Tusita (heaven).

Now, arriving in Magadha, he has admired the Vajrasana and has humbly met the abbot of Vijnanamatra (School). Kui-pao and a group of venerable monks had together taken the vow to go to be born in Tusita (heaven). Amongst the three hundred thousand persons Kui-pao is the first, Che-yi is the *s*econd, Kuang-fong the third and the others mentioned in order are Hui-yen, Ch'ong-ta, Ts'iuan-tsun, Yuan-chen, Yi-sien, Hui-siu, Che-yong, Fong-sheng. Ts'ing-yun, etc. They have together desired to pay homage to

Maitreya, the compassionate and the honoured one, and have now engraved the images of seven Buddhas which they place on record.

(b) The inscription of the monk K'o-Yun, dated A.D. 1022

Memoir on the bodies (kaya) and the thrones of Buddha by monk, K'o-yun, a transmitter of the Sutras and teacher of the Sastras, a native of Si-ho of the great Song Empire.

K'o-yun left the Imperial territory and came to contemplate on the country of Buddha. When he saw the marvellous traces and the holy vestiges how could he help not becoming a respectful panegyrist of the gladdening excellence (of the Buddha)? K'o-yun exhausted all his remaining resources and at thirty steps to the north of the Bodhi tree he set up a beautiful stupa in stone of the 1000 Buddhas. He erected a lasting monument on the spot where (the Maitreya Buddha) will take three steps. Although the height of his capacities was not enough to express his sentiments by writing, the benign work of the Law surpassed his respect to such an extent as to impose itself on his inner self. He tried to compose some lines is an undignified language to celebrate the unborn...

The Emperor of the Great Song dynasty humbly wished that his destiny should be like the water of the celestial lake which is abundant and which neither diminishes nor increases, that his prosperity should be like the celestial peak of the mountain which is high and which always remains high and majestic. My sovereign desired also that in future in this country there should be somebody to occupy continuously the place of Sankha – that in other regions there would be in the future generations a fame like that of Candrachattra – that if henceforth anyone composes a eulogy of the marvellous traces and the holy vestiges, he should take care to write it and make a memoir of it.

Recorded in the month *yi-se,* of the year *jen-siu* of the *period t'ien-hi* (A.D. 1022) of the great Song dynasty.

(c) The inscription of the monk Yi- Ts'ing dated A.D. 1022

The monk Yits'ing and the disciple of the master Yi-lin of the Dhyana court of the prosperous religion in the eastern capital of the great Song Empire acquit themselves of the charge of offering a kasaya, woven with golden threads, offered as a token of gratitude for the four acts of kindness and three indulgences. After having spread it and hung it on the throne of

Buddha in India they set up a stupa in stone. The 4th day of the 4th month of the 6th year *t'ien-hi* (A.D. 1022) the Upadhyaya Pien-cheng being, the great master (of the ceremony).

(d) The inscription of Huai-Wen, dated A.D. 1033

The erection of a stupa, in honour of the Emperor T'ai- tsong by the Emperor and the Dowager Empress of the great Song dynasty:

Of the great Song dynasty, the Emperor who is of saintly and pacific character, a wise warrior, good and intelligent, pious and virtuous, and the Dowager Empress who is in harmony with the original principle, who honours virtue and good, who has a long life, does good to others and is saintly, have respectfully charged the monk Huai-wen with the task of going to the country of Magadha in order to erect a stupa by the side of the Vajrasana dedicated to T'ai-tsong, the Emperor who was perfectly good, in harmony with reason, divinely meritorious, saintly and virtuous, pacific and warrior, clear-minded and illustrious, endowed with wide intelligence and profoundly pious.

The Emperor T'ai-tsong humbly desired to go up to the abode of the devas, to receive personally from Buddha the account which confirms the scriptures, to attain the residence of the good saints for all times as his place of habitation, so that the worship of Sakra and Brahma might be his great recompense and the majestic and supernatural influence might raise his dynasty for ever to a higher position.

Written on the 19th day of the first month of the 12th year *ming-tao* being marked by the signs, kui-yi (A.D.1033).

2. A Mon inscription from Prome of the reign of Kyanzittha [1084-1112 A.D.][69]

Then the king wrote of the grace of the Buddharatna, Dharmmaratna, (and) Sangharatna (upon a leaf of gold with vermilion ink ?), the king sent it to the Coli prince. The Coli prince, with all his array, hearing of the grace of Buddha, the Law, (and) the Church, from King Sri Tribhuwanadityadhammaraja' sending (word of it to him), he cast off his adhesion to false doctrines, (and) he adhered straightaway to the true doctrine…

3. The Tibetan pilgrim Dharmasvamin, who visited eastern India in the years 1234-36, on the devastation wrought by the Turks[70]

[Of Vikramsila] there were then no traces left, the Turushka soldiery having razed it to the ground, and thrown the foundation stones into the Ganges. [At Nalanda] there was absolutely no-one to look after them [the damaged viharas], or to make offerings…

4. Rashid al-din on some fundamental commandments of *Shâkamûni*[71]

Concerning that which is allowed and that which is forbidden, he said furthermore: 'Drink no wine, kill no animal for the sake of food and make not your stomach the grave of living creatures; neither kill harmful animals, insects and reptiles, for had they not been hurt in a previous form of existence, they would not do the same in this present existence.'

To the sect of the *Śrāvakas* and *Pratyekabuddhas*, he said that they must earn their food by begging; and if then food of animal nature was thrown into their beggar's bowl, they should not enquire as to its origin but should eat all, whatever it might be, to pacify the stomach.

And of the sect of the *Samyaksambuddhas* he said: 'Since ye have attained the power of discrimination between good and evil, ye must yourselves know what to do, what may be eaten, and that animals may not be tortured. But if ye are hungry and are given a dead animal or one that has been put to death, eat it then, but in no case may ye grant permission for animals to be killed.'

5. Description of a miracle in the valley, north of Kabul near the foot of the Indian Caucasus, the Bamiyan Buddhas, Odoric of Pordenone[72]

Another great and terrible thing I saw. For, as I went through a certain valley which lieth by the River of Delights, I saw therein many dead corpses lying. And I heard also therein sundry kinds of music, but chiefly nakers, which were marvelously played upon. And so great was the noise thereof that very great fear came upon me. Now, this valley is seven or eight miles long; and if any unbeliever enters therein he quitteth it never again, but perisheth incontinently. Yet I hesitated not to go in that I might see once for all what the matter was. And when I had gone in I saw there, as I have said, such numbers of corpses as no one without seeing it could deem credible. And at one side of the valley, in the very rock, I beheld as it were the face of a man very great and terrible, so very terrible indeed that for my exceeding great fear my spirit seemed to die in me. Wherefore I made the sign of the cross, and began continually to repeat Verbum caro factum but I

dared not at all to come nigh that face, but kept at seven or eight paces from it. And so I came at length to the other end of the valley, and there I ascended a hill of sand and looked around me. But nothing could I descry, only I still heard. Those nakers to play which were played so marvelously. And when I got to the top of that hill I found there a great quantity of silver heaped up as it had been fishes' scales, and some of this I put into my bosom. But as I cared nought for it, and was at the same time in fear lest it should be a snare to hinder my escape, I cast it all down again to the ground. And so by God's grace I came forth scathless. Then all the Saracens when they heard of this, showed me great worship, saying that I was a baptized and holy man. But those who had perished in that valley they said belonged to the devil.

I. Selection of Lama

Among the earliest accounts of Tibet and the selection of the Lama; Pero Tafur took a three and a half year trip to the eastern Mediterranean starting in 1435 and while trying to arrange a passage to India, made contact with Nicolo Conti returning home after 20 years travels in the East. Tafur did not himself visit India but wrote on the basis of what he learned from Conti during 15 days of conversation[73]

They say that in India there is a very high mountain, very difficult of ascent, so much so that in ancient times those below had no knowledge of those above, and vice-versa; but that a road was made, and even a chain put down so that one could go up or come down. On top of the mountain, there is a great plain, where they sow and reap wheat, and have herds, and there are many fertile gardens with many fruits and many fountains, with all the things necessary to the life of mankind. And on a rock there is a great monastery where those who have the rank of priest are accustomed to send as electors, twelve noble and virtuous old men, in order that they may select the High Priest or Lord, when this position is vacant. This is done in the following manner: The elder sons and daughters are sent there to be brought up, and they marry and have families, and are provided with all the things necessary for life. They are given horses, and arms, bows and arrows, and are taught the art of war and the art of governing people. The electors who are there each day take counsel among themselves and observe the one who

seems to them to be the best suited to succeed to the office of High Priest when this position becomes vacant. They already have in mind the one to be chosen, and when the Lord dies, his nobles take him on their stretchers, covered in mourning to the mountain. When the electors see this from their high place, they take the chosen one and give him as High Priest to the nobles and take from them the body of the deceased, and bury it in their monastery, with all the honour due it. The others go away with their new Lord, and with great feasts and rejoicing, pledge to him their obedience. Certain tribes then come with their gifts, some bringing pearls, other precious stones of great value, and others quantities of gold, depending on what is produced in the land where each lives.

❑

CHAPTER — 7

Varna and Jati

A. Classes of men
B. Brahmins
C. Kshatriyas and Nairs
D. Vaishyas
E. Sudras
F. Doms
G. Mlecchas
H. Equality of beings

A. Classes of Men

1. Castes, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[1]

In every kingdom, the members of the royal family belong to the same one family, and the authority does not go out of it. They have heir apparents; similarly, the calligraphists *(abl al-kitabat)* and the physicians belong to particular families, and these professions *(al-sana' at)* remain exclusively with them.

2. Professions hereditary, Sulaiman[2]

In all these kingdoms the nobility is considered to form but one family. Power resides in it alone. The princes name their own successors. It is the same with learned men and physicians. They form a distinct caste, and the profession never goes out of the caste.

3. Seven classes of Hindus, Ibn Khurdadba[3]

There are seven classes of Hindus, viz., 1st, Sabkufria, among whom are men of high caste, and from among whom kings are chosen. The people of the other six classes do the men of this class homage, and them only. 2nd, Brahma, who totally abstain from wine and fermented liquors. 3rd, Kataria, who drink not more than three cups of wine; the daughters of the class of Brahma are not given in marriage to the sons of this class, but the Brahmas take their daughters. 4th, Sudaria, who are by profession husbandmen. The 5th, Baisura, are artificers and domestics. The 6th, Sandalia, who perform menial offices. 7th, Lahud; their women are fond of adorning themselves,

and the men are fond of amusements and games of skill. In Hind there are forty-two religious sects; part of them believe in a creator and Prophet (the blessing of God be upon them); part deny the mission of a Prophet, and part are atheists.

4. Varna and jataka, Alberuni[4]

The Hindus call their castes *varna, i.e. colours,* and from a genealogical point of view they call them *jataka, i.e. births.* These castes are from the very beginning only four.

I. The highest caste are the Brahmana, of whom the book of the Hindus tell that they were created from the head of Brahman. And as Brahman is only another name for the force called *nature,* and the head is the highest part of the animal body, the Brahmana are the choice part of the whole genus. Therefore the Hindus consider them as the very best of mankind.

II. The next caste are the Kshatriya who were created, as they say, from the shoulders and hands of Brahman. Their degree is not much below that of the Brahmana.

III. After them follow the Vaisya, who were created from the thigh of Brahman.

IV. The Sudra, who were created from his feet.

Between the latter two classes there is no very great distance. Much, however, as these classes differ from each other, they live together in the same towns and villages, mixed together in the same houses and lodgings.

After the Sudra follow the people called *Antyaja,* who render various kinds of services, who are not reckoned amongst any caste, but only as members of a certain craft or profession.

There are eight classes of them, who freely intermarry with each other, except the fuller, shoemaker, and weaver, for no others would condescend to have anything to do with them. These eight guilds are the fuller, shoemaker, juggler, the basket and shield maker, the sailor, fisherman, the hunter of wild animals and of bird, and the weaver. The four castes do not live together with them in one and the same place. These guilds live near the villages and towns of the four castes, but outside them.

The people called Hadi, Doma (Domba), Candala, and Badhatau *(sic)* are not reckoned amongst any caste or guild. They are occupied with dirty work, like the cleansing of the villages and other services. They are

considered as one sole class, and distinguished only by their occupations. In fact, they are considered like illegitimate children; for according to general opinion they descend from a Sudra father and a Brahmani mother as the children of fornication; therefore they are degraded outcasts.

Different occupations of caste

The Hindus give every single man of the four castes characteristic names, according to their occupations and modes of life. *E.g.* the Brahmana is in general called by this name as long as he does his work staying at home. When he is busy with the service of one fire, he is called *ishtin;* if he serves three fires, he is called *agnihotrin;* if he besides offers an offering to the fire, he is called *dikshita.* And as it is with the Brahmana, so is it also with the other castes. of the classes *beneath* the castes, the Hadi are the best spoken of, because they keep themselves free from everything unclean. Next follow the Doma, who play on the lute and sing. The still lower classes practise as a trade killing and the inflicting of judicial punishments. The worst of all are the Badhatau, who not only devour the flesh of dead animals, but even of dogs and other beasts…

Moral qualities of Brahmins

Arjuna asked about the nature of the four castes and what must be their moral qualities, where upon Vasudeva answered:

"The Brahmana must have an ample intellect; a quiet heart, truthful speech, much patience; he must be master of his senses, a lover of justice, of evident purity, always directed upon worship, entirely bent upon religion..."

Hindus differ among themselves as to which of these is capable of attaining to liberation; for, according to some, only the Brahmana and Kshatriya are capable of it, since the others cannot learn the Veda, whilst according to the Hindu philosophers, liberation is common to all castes and to the whole human race, if their intention of obtaining it is perfect. This view is based on the saying of Vyasa: "Learn to know the twenty-five things thoroughly. Then you may follow whatever religion you like; you will no doubt be liberated." This view is also based on the fact that Vasudeva was a descendant of a Sudra family and also on the following saying of his, which he addressed to Arjuna: "God distributes recompense without injustice and without partiality. He reckons the good as bad if people in doing good

forget him; he reckons the bad as good if people in doing bad remember him and do not forget him, whether those people be Vaisya or Sudra or women. How much more will this be the case when they are Brahmana or Kshatriya."

5. Seven classes, Gardizi[5]

ABU 'ABDALLAH JAYHANI says in his book of history (*Kiytab-I-tavarik*) that there are seven classes (*guruh*) of them. (a) The first is called Sakb.tri; this class is the greatest among them and all the Indian tribes prostrate themselves before (its members), while the latter do not do so before anyone. Kingdom (kingship?) belongs to them and they are few. (b) The Brahmans…) but they are not kings. They…prostrate themselves before the S.mnani (*sic*) but the S.mnan do not do so before them. Most of these Brahmans drink no wine and eat no meat. (c) The third are the Kshatriya (spelt *K.shiriyan*) who do not drink wine more than thrice (at a time). (d) The fourth are the *Shudra* (spelt *Sudhriyan*). They are agriculturists and gardeners (*palizban*). They associate with the Kshatriya, from who they take women and do to whom they given theirs (but the Brahmans) do not give them women…(f) The sixth are the Chandala who are singers and also carry out punishments. They have beautiful women. If a Brahman falls in love with such a woman, the keepers of religion expel him and consider him no more a Brahman. For this reason he who touches a Chandala becomes subject to harm. These Chandala go about with a piece (of wood) in their hands; at the end of that piece of wood there is a ring and within it smaller rings are fitted, and with this piece of wood they give warning that men, on seeing that sign and on hearing the sound of the rings, should get out of their way and no harm befall them. (g) (The seventh) are the class called Dunbi (spelt *Rubnan*) who are black-skinned. They are all players on stringed instruments and dancers (*pay-kub*). They are altogether like the Chandala. The latter mix with them and take women from them but do not give them theirs.

6. Great number of classes at Calicut, Abder Razzak[6]

The Infidels are divided into a great number of classes, such as the Bramins, the Djoghis [yogis], and others. Although they are all agreed upon the fundamental principle of polytheism and idolatry, each sect has its peculiar customs. Amongst them there is a class of men, with whom it is the practice

for one woman to have a great number of husbands, each of whom undertakes a special duty and fulfils it. The hours of the day and of the night are divided between them; each of them for a certain period takes up his abode in the house, and while he remains there no other is allowed to enter. The *Sameri* [the Zamorin] belongs to this sect.

7. Five classes at Cochin, Ma Huan[7]

There are five classes of men in this kingdom. The Nairs rank with the king. In the first class are those who shave their heads, and have a thread or string hanging over the shoulder, these are looked upon as belonging to the noblest families [Brahmins]. In the second are the Muhammadans; in the third the Chittis, who are the capitalists; in the fourth the Kolings, who act as commission agents; in the fifth the Mukuas, who are the lowest and poorest of all. The Mukuas live in houses which are forbidden by the Government to be more than three feet high, and they are not allowed to wear long garments; when abroad, if they happen to meet a Nair or a Chitti they at once prostrate themselves on the ground and dare not rise until they have passed by; these Mukuas get their living by fishing and carrying burdens.

B. Brahmins

1. Brahmin temples and merchants encountered by the Chinese priest Kien-tchen [A.D. 742-54] on a visit from China to Japan as described by his disciple[8]

There were also three monasteries of Po-lo-men (Brahmans) where Brahmans were residing. The tanks in these monasteries contained blue lotuses, particularly beautiful, of which the flowers, leaves and roots were perfumed.

On the river (of Kouang-tong) (Canton) there were merchantmen belonging to the Po-lo-men (Brahmans of India), the Po-sseu (Persians), the K'ouen-louen (Malays), and others besides, of which it is difficult to determine the number. They are all laden with incense, herbs, jewels and other precious products. The merchandise was piled up in heaps. These ships were 60 to 70 feet deep.

2. On references to Rahmans [Brahmins in medieval Russian works][9]

(a) Among the Christians in Galicia there were sayings like

We fast like the Rahmans.

(b) In the Ukraine language, 'rahman' came to mean a righteous Christian and in the Kaluga and Smolensk region, the adjective 'rahmany' meant ...meek, simple-hearted, strange.

(c) [The Rahmans are not] burdened by sins, but live quietly close to the angels and bliss is sent upon them from God. [They are called] naked sages, because they have rid themselves of all passions.

3. Brahmins – the devotees of India, Ibn Khurradadhbih[10]

They are the devotees of India. They dress in leopard-skins or skins of other (animals). Sometimes it so happens that one of them stands up with a staff in his hand and people gather round him; thus he keeps standing for a whole day until evening, giving a sermon to the people; reminding them of Almighty God and describing to them the affairs of all the peoples that have perished in the past…They worship idols believing in them as mediators between themselves and Almighty God.

4. Brahmins of Kanauj particularly talented, Abu Zaidu-l Hasan of Sira[11]

Among the Indians there are men who are devoted to religion and men of science, whom they call Brahmans. They have also their poets who live at the courts of their kings, astronomers, philosophers, diviners, and those who draw omens from the flight of crows, etc. Among them are diviners and jugglers, who perform most astonishing feats. These observations are especially applicable to Kanauj, a large country forming the empire of Jurz.

5. Most noble and illustrious, Al Masudi[12]

The Indians gave themselves a king, Brahma the Great, who reigned 366 years, and in whose times the book Sindhind [Siddhanta] and Arjabahad [Aryabhatta] were composed. His descendants have retained to our days the name Brahmans. They are honoured by Indians as forming the most noble and illustrious caste. They do not eat the flesh of any animal, and both men and women wear yellow threads suspended round their necks, like a baldrick, to distinguish them from the other castes of India.

6. Obligations of Brahmins, Alberuni[13]

The life of the Brahman, after seven years of it have passed, is divided into four parts. The first part begins with the eighth year, when the

Brahmans come to him to instruct him, to teach him his duties, and to enjoin him to adhere to them and to embrace them as long as he lives. Then they bind a girdle round his waist and invest him with a pair of *yajnopavitas, i.e.* one strong cord consisting of nine single cords which are twisted together, and with a third *yajnopavita,* a single one made from cloth. This girdle runs from the left shoulder to the right hip. Further, he is presented with a stick which he has to wear, and with a seal-ring of a certain grass, called *darbha,* which he wears on the ring-finger of the right hand. This seal-ring is also called *pavitra.* The object of his wearing the ring on the ring-finger of his right hand is this, that it should be a good omen and a blessing for all those who receive gifts from that hand. The obligation of wearing the ring is not quite so stringent as that of wearing the *yajnopavita,* for from the latter he is not to separate himself under any circumstances whatever. If he takes it off while eating or fulfilling some want of nature, he thereby commits a sin which cannot be wiped off save by some work of expiation, fasting, or almsgiving.

This first period

This first period of the Brahman's life extends till the twenty-fifth year of his age, or, according to the *Vishnu-Purana,* till his forty-eighth year. His duty is to practise abstinence, to make the earth his bed, to begin with the learning of the Veda and of its explanation, of the science of theology and law, all this being taught to him by a master whom he serves day and night. He washes himself thrice a day, and performs a sacrifice to the fire both at the beginning and end of the day. After the sacrifice he worships his master. He fasts a day and he breaks fast a day, but he is never allowed to eat meat. He dwells in the house of the master, which he only leaves in order to ask for a gift and to beg in not more than five houses once a day, either at noon or in the evening. Whatever alms he receives he places before his master to choose from it what he likes. Then the master allows him to take the remainder. Thus the pupil nourishes himself from the remains of the dishes of his master. Further, he fetches the wood for the fire, wood of two kinds of trees, *palasa (Butea frondosa)* and *darbha,* in order to perform the sacrifice; for the Hindus highly venerate the fire, and offer flowers to it. It is the same case with all other nations. They always thought that the sacrifice was accepted by the deity if the fire came down upon it, and no other

worship has been able to draw them away from it, neither the worship of idols nor that of stars, cows, asses, or images. Therefore Bashshar Ibn Burd says: “Since there is fire, it is worshipped.”

The second period

The second period of their life extends from the twenty-fifth year till the fiftieth, or, according to the *Vishnu-Purana* till the seventieth. The master allows him to marry. He marries, establishes a household, and intends to have descendants, but he cohabits with his wife only once in a month after she has become clean of the menstruation. He is not allowed to marry a woman above twelve years of age. He gains his sustenance *either* by the fee he obtains for teaching Brahmans and Kshatriyas, not as a payment, but as a present, *or* by presents which he receives from some one because he performs for him the sacrifices to the fire, *or* by asking a gift from the kings and nobles, there being no importunate pressing on his part, and no unwillingness on the part of the giver. There is always a Brahman in the houses of these people, who there administers the affairs of reli-gion and the works of piety. He is called *purohita.* Lastly, the Brahman lives from what he gathers on the earth or from the trees. He may try his fortune in the trade of clothes and betel-nuts, but it is preferable that he should not trade himself, and that a Vaisya should do the business for him, because originally trade is forbidden on account of the deceiving and lying which are mixed up with it. Trading is permitted to him only in case of dire necessity, when he has no other means of sustenance. The Brahmans are not, like the other castes, bound to pay taxes and to perform services to the kings. Further, he is not allowed continually to busy himself with horses and cows, with the care for the cattle, nor with gaining by usury. The blue colour is impure for him, so that if it touches his body, he is obliged to wash himself. Lastly, he must always beat the drum before the fire, and recite for it the prescribed holy texts.

The third period

The third period of the life of the Brahman extends from the fiftieth year to the seventy-fifth, or, according to the *Vishnu Purana,* till the ninetieth. He practises abstinence, leaves his household, and hands it as well as his wife over to his children, if the latter does not prefer to accompany him into the life in the wilderness. He dwells outside civilisation, and leads the same

life again which he led in the first period. He does not take shelter under a roof, nor wear any other dress but some bark of a tree, simply sufficient to cover his loins. He sleeps on the earth without any bed, and only nourishes himself by fruit, vegetables, and roots. He lets the hair grow long and does not anoint himself with oil.

The fourth period

The fourth period extends till the end of life. He wears a red garment and holds a stick in his hand. He is always given to meditation; he strips the mind of friendship and enmity, and roots out desire, and lust, and wrath. He does not converse with anybody at all. When walking to a place of a particular merit, in order to gain a heavenly reward, he does not stop on the road in a village longer than a day, nor in a city longer than five days. If anyone gives him something, he does not leave a remainder of it for the following day. He has no other business but that of caring for the path which leads to salvation, and for reaching *moksha,* whence there is no return to this world.

The universal duties of the Brahman throughout his whole life are works of piety, giving alms and receiving them. For that which the Brahmans give reverts to the *pitaras* (is in reality a benefit to the *Fathers).* He must continually read, perform the sacrifices, take care of the fire which he lights, offer before it, worship it, and preserve it from being extinguished, that he may be burned by it after his death. It is called *homa.*

Every day he must wash himself thrice: at the *samdhi* of rising, *i.e.* morning dawn, at the *samdhi* of setting, *i.e.* evening twilight, and between them in the middle of the day. The first washing is on account of sleep, because the openings of the body have become lax during it. Washing is a cleansing from accidental impurity and a preparation for prayer.

Prayers

Their prayer consists of praise, glorification, and prostration according to their peculiar manner, viz. prostrating themselves on the two thumbs, whilst the two palms of the hands are joined, and they turn their faces towards the sun. For the sun is their *kibla,* wherever he may be, except when in the south. For they do not perform any work of piety with the face turned southward; only when occupied with something evil and unlucky they turn themselves towards the south.

The time when the sun declines from the meridian (the afternoon) is well suited for acquiring in it a heavenly reward. Therefore at this time the Brahman must be clean.

The evening is the time of supper and of prayer. The Brahman may take his supper and pray without having previously washed himself. Therefore, evidently, the rule as to the third washing is not as stringent as that relating to the first and second washings.

A nightly washing is obligatory for the Brahman only at the times of eclipses, that he should be prepared to perform the rules and sacrifices prescribed for that occasion.

The Brahman, as long as he lives, eats only twice a day, at noon and at nightfall; and when he wants to take his meal, he begins by putting aside as much as is sufficient for one or two men as alms, especially for strange Brahmans who happen to come at evening time asking for something. To neglect *their* maintenance would be a great sin. Further, he puts something aside for the cattle, the birds, and the fire. Over the remainder he says prayers and eats it. The remainder of his dish he places outside his house, and does not any more come near it, as it is no longer allowable for him, being destined for the chance passerby who wants it, be he a man, bird, dog, or something else.

The Brahman must have a water-vessel for himself. If another one uses it, it is broken. The same remark applies to his eating-instruments. I have seen Brahmans who allowed their relatives to eat with them from the same plate, but most of them disapprove of this.

He is obliged to dwell between the river Sindh in the north and the river Carmanvati in the south. He is not allowed to cross either of these frontiers so as to enter the country of the Turks or of the Karnata. Further, he must live between the ocean in the east and west. People say that he is not allowed to stay in a country in which the grass which he wears on the ring-finger does not grow, nor the black-haired gazelles graze. This is a description for the whole country within the just-mentioned boundaries. If he passes beyond them he commits a sin.

In a country where not the whole spot in the house which is prepared for people to eat upon it is plastered with clay, where they, on the contrary, prepare a separate tablecloth for each person eating by pouring water over a spot and plastering it with the dung of cows, the shape of the Brahman's

tablecloth must be square. Those who have the custom of preparing such tablecloths give the following as the cause of this custom – The spot of eating is soiled by the eating. If the eating is finished, the spot is washed and plastered to become clean again. If, now, the soiled spot is not distinguished by a separate mark, you would suppose also the other spots to be soiled, since they are similar to and cannot be distinguished from each other.

Five vegetables are forbidden to them by the religious code:-Onions, garlic, a kind of gourd, the root of a plant like the carrots called *krncn* (?), and another vegetable which grows round their tanks called *nali*.

7. A religious class, Al-Idrisi[14]

…the Brahmans…are the religious class. They dress in the skins of tigers and other animals. Sometimes one of them, taking a staff in his hand, will assemble a crowd around him, and will stand from morn-till eve-speaking to his auditors of the glory and power of God, and explaining to them the events which brought destruction upon the ancient people, that is, upon the Brahmans. They never drink wine nor fermented liquors. They worship idols (whom they consider to be) able to intercede with the Most High.

8. "Have the leadership under the king," Marvazi, the Sicilian geographer of the court of the Norman king, Roger II[15]

The Brahmans have the leadership under the king. They prostrate themselves before the Sumani, but the latter do not do so before them. Some of those who belong to this caste do not drink wine or intoxicating drinks.

9. Brahmins [Vaishyas?] in the province of Lac, Loac, or Lar [Gujarat], Marco Polo[16]

Leaving the place where rests the body of the glorious apostle Saint Thomas, and proceeding westward, you enter the province of Lar, from whence the Bramins, who are spread over India, derive their origin. These are the best and most honourable merchants that can be found. No consideration whatever can induce them to speak an untruth, even though their lives should depend upon it. They have also an abhorrence of robbery or of purloining the goods of other persons. They are likewise remarkable for the virtue of continence, being satisfied with the possession of one wife. When any foreign merchant, unacquainted with the usages of the country,

introduces himself to one of these, and commits to his hands the care of his adventure, this Bramin undertakes the management of it, disposes of the goods, and renders a faithful account of the proceeds, attending scrupulously to the interests of the stranger, and not demanding any recompense for his trouble, should the owner uncourteously omit to make him the gratuitous offer. They eat meat, and drink the wine of the country. They do not, however, kill any animal themselves, but get it done by the Mahometans. The Bramins are distinguished by a certain badge, consisting of a thick cotton thread, which passes over the shoulder and is tied under the arm, in such a manner that the thread appears upon the breast and behind the back.

10. Priests at Cambay, Nicolo Conti[17]

There are priests here who are called bachali, who only marry one wife. The wife is, by law, burnt with the body of her husband. These priests do not eat any animal food, but live upon rice, milk, and vegetables.

11. Abstain from all animal food, Nicolo Conti[18]

Their priests, the Bachali, abstain from all animal food, particularly the ox, which they consider it a great crime to kill or to eat, as being of all the most useful to man: the Indians use the ox as a beast of burthen. These priests live upon rice, herbs, fruit, and vegetables: they have only one wife, who is burnt with her dead husband. Lying by the side of the corpse, with her arm under its neck, she submits herself the flames, without giving way to any expression of pain.

12. "Of superior cultivation," Nicolo Conti[19]

There is a class of philosophers found throughout all India, called Brahmins, who devote themselves much to astronomy and the prediction of future events. They are men of superior cultivation, and are distinguished by a greater sanctity of life and manners. Nicolo asserts that he saw among them one who was three hundred years old, an instance of longevity which they regard as miraculous; so much so, that wherever he went he was followed by the children. An art which they call geomantia, is practised by many of them, by means of which they frequently predict future events with as much accuracy as though they were present. They also make use of incantations, by means of which they are frequently able to excite tempests

and also to allay them. On this account many eat in secret, fearing lest they should be fascinated by the eyes of lookers on.

13. In a story from the *Libro de los exemplos por A.B.C.,* the author illustrates the virtues of abstinence and simple living by quoting a letter which the *Bragamanos* [a Spanish version of Brahmins] supposedly wrote describing their life[20]

...We do not build houses, but live in the caves in the mountains....We do not covet riches, for the only rich person is the one who is content with what he has...We are not envious because we are all equal...We do not plough nor sow...nor do we seek any food other than that which nature gives us...And because we live moderately we are healthy and do not suffer illness nor require the services of doctors....Since we know how to conquer the enemies from within, which are the fleshly appetites; we have no external enemies....Because of this, we avoid violent and sudden death, and we all live to be very old, awaiting with great desire the blessed life of paradise.

C. Kshatriyas

1. Kshatriyas, Alberuni[21]

The Kshatriya reads the Veda and learns it, but does not teach it. He offers to the fire and acts according to the rules of the Puranas. In places where...a tablecloth is prepared for eating, he makes it angular. He rules the people and defends them, for he is created for this task. He girds himself with a single cord of the threefold *yajno-pavita,* and a single other cord of cotton. This takes place after he has finished the twelfth year of his life.

2. Mostly princely families of India, Gardizi[22]

This group called RACH.N.RI (Kshatriyas?) are mostly of princely families of India and from the king's party (*shia* for *shifta*). Their religion is to serve the kings and to help them in any case. They say "we do not weary ourselves without a profit or some necessity (*bi-naf i ya daf i*). The best thing is to serve the kings and attend on them in struggling against their enemies. Should we gain victory, our rank (*miqdar?*) in the king's service will increase and our glory rise, and we shall obtain the best things in the world. If, however, we die in our endeavours we shall go to Paradise with all its blessings." These people are mainly, courageous, and valiant. They

have deadly swords and are very impatient (*shakt na-sabur*) to sacrifice their life.

D. Vaishyas

1. Vaishyas practice agriculture, Alberuni[23]

It is the duty of the Vaisya to practise agriculture and to cultivate the land, to tend the cattle and to remove the needs of the Brahmans. He is only allowed to gird himself with a single *yajnopavita,* which is made of two cords.

2. A Hindu merchant of Nahrwala, Muhammad U'fi[24]

In the city or Nahrwala there lived a Hindu merchant who having deposited nine lacs of Balotras in the hands of a certain person, after some time died. The trustee then sent for the merchant's son and said: Your father left with me nine lacs of Balotras. The son replied that he knew nothing about it, but that there would probably be mention made of the transaction in his father's accounts. These he sent for but could find nothing about nine lacs! on this he observed: "Had my father entrusted anybody with so large a sum, surely mention would have been made of it in his account book; this not being the case, I cannot feel myself justified in taking possession of the money." The trustee urged the youth to take the money, but he still refused, and the contention grew hot between them. At last they agreed to refer the matter to the arbitration of Rai Jai Sing Deo, who gave it as his opinion, that since the two could not agree as to the disposal of the money, it was advisable that it should be expended on some work of lasting utility, so that the real owner would reap the reward of virtue and charity. Accordingly the 'nine-lack reservoir', the finest in the world, hitherto unsurpassed by all that the cleverest and wisest have executed or imagined, was built; and remains to be seen to this day.

E. Sudras

1. The Sudra, Alberuni[25]

The Sudra is like a servant to the Brahman, taking care of his affairs and serving him. If, though being poor in the extreme, he still desires not to be without a *yajnopavita,* he girds himself only with the linen one...

Every man who takes to some occupation which is not allowed to his caste, as, *e.g.* a Brahman to trade, a Sudra to agriculture, commits a sin or crime, which they consider only a little less than the crime of theft…

2. Labourers and agriculturists, Al-Idrisi[26]

Next comes the Sharduya, who are labourers and agriculturists; then the Basya, who are artizans and mechanics; then the Sabdaliya (or Sandaliya), who are singers, and whose women are noted for their beauty; and, lastly, the Zakya, who are jugglers, tumblers, and players of various instruments.

F. Doms

Have to do drudgeries, Friar Jordanus[27]

There be also certain others which be called *Dumbri* who eat carrion and carcasses; who have absolutely no object of worship: and who have to do the drudgeries of other people, and carry loads.

G. Mlecchas

Non-Hindus called *mleccha,* Alberuni[28]

All other men except the Candala, as far as they are not Hindus, are called *mleccha*, *i.e.* unclean, all those who kill men and slaughter animals and eat the flesh of cows.

H. All beings Equal

Vasudeva says they appear different only to the ignorant, Alberuni[29]

All these things originate in the difference of the classes or castes, one set of people treating the others as fools. This apart, all men are equal to each other, as Vasudeva says regarding him who seeks salvation: "In the judgement of the intelligent man, the Brahman and the Candala are equal, the friend and the foe, the faithful and the deceitful, nay, even the serpent and the weasel. If to the eyes of intelligence all things are equal, to ignorance they appear as separated and different."

End-notes

1. The Russian religious verse, *Dove-Book*, on the origins of man bears a marked resemblance to the *Purusha Sukta* of the Rig Veda, Bongard-Levin, p., 17

The rulers in our world came from the sacred head of Adam; the princely boyars from the sacred body of Adam; orthodox peasants from the sacred feet of Adam.

❑

CHAPTER — 8

Women

A. Some Observations
B. Marriage
C. Sati
D. Devadasis
E. House of Prostitution

A. Some observations

1. Royal women not veiled, Abu Zaidu-l Hasan, of Sira[1]

Most of the princes of India, when they hold a court, allow their women to be seen by the men who attend it, whether they be natives or foreigners. No veil conceals them from the eyes of the visitor.

2. Women at Calicut, *A Journal of The First Voyage of Vasco Da Gama*[2]

The women of this country, as a rule, are ugly and of small stature. They wear many jewels of gold round the neck, numerous bracelets on their arms, and rings set with precious stones on their toes. All these people are well disposed and apparently of mild temper. At first sight they seem covetous and ignorant.

B. Marriage

1. Matrimonial alliances determine descent, Alberuni[3]

…in former times there were three modes of determining descent or relationship:

1. The child born to a man by his legitimate wife is the child of the father, as is the custom with us and with the Hindus.

2. If a man marries a woman and has a child by her; if, further, the marriage-contract stipulates that the children of the woman will belong to *her* father, the child is considered as the child of its grandfather who made that stipulation, and not as the child of its father who engendered it.

3. If a stranger has a child by a married woman, the child belongs to her husband, since the wife being, as it were, the soil in which the child has

grown, is the property of the husband, always presupposing that the sowing, *i.e.* the cohabitation, takes place with his consent…

The four sons of Pandu had one wife in common, who stayed one month with each of them alternately. In the books of the Hindus it is told that Parasara, the hermit, one day travelled in a boat in which there was also a daughter of the boatman. He fell in love with her, tried to seduce her, and finally she yielded; but there was nothing on the bank of the river to hide them from the looks of the people. However, instantaneously there grew a tamarisk-tree to facilitate their purpose. Now he cohabited with her behind the tamarisk, and made her conceive, whereupon she became pregnant with this his excellent son Vyasa.

All these customs have now been abolished and abrogated, and therefore we may infer from their tradition that in principle *the abrogation of a law is allowable.*

2. Marriage customs, Alberuni[4]

Every nation has particular customs of marriage, especially those who claim to have a religion and law of divine origin. The Hindus marry at a very young age; therefore the parents arrange the marriage for their sons. On that occasion the Brahmans perform the rites of the sacrifices, and they as well as others receive alms. The implements of the wedding rejoicings are brought forward. No gift is settled between them. The man gives only a present to the wife, as he thinks fit, and a marriage gift in advance, which he has no right to claim back, but the wife may give it back to him of her own will. Husband and wife can only be separated by death, as they have no divorce.

3. Marriage in Coromandel, Chau Ju-Kua[5]

When contracting marriage, they send, in the first place, a female go-between with a gold (or) silver finger-ring to the girl's home. Three days afterwards there is a meeting of the man's family to decide upon the amount of land, cotton, betel nuts, wine and the like to be given as marriage portion.

The girl's family sends in return (a?) gold or silver finger-ring, *yue-no* [probably a kind of muslin] cloth and brocaded clothing to be worn by the bride to the (intended) son-in-law. Should the man wish to withdraw from the engagement, he would not dare reclaim the marriage gifts; if the girl should wish to reject the man she must pay back double.

4. Marriages in Chola country, Ma Twan-lin[6]

For marriages, the suitor sends at first a mediatrix to the family of the young girl, whom he courts, offering her a ring of gold or silver. Three days after, the relatives of the young man, join and consult together to determine if they could, according to their resources, give to the new household some fields, domestic animals, or only palm wine and some areca nuts and so on. From their side, the future relations send to the fiance some gold or silver rings; some pieces of cloth; and some beautiful clothes for his wife. These preliminaries ended, if the young man refuses to marry the young girl, he should sent back the tokens of betrothal that he has received, and if it is the young girl who wishes to retract, she ought to restore twice the presents she has accepted.

5. Marriages celebrated with much singing and feasting, Nicolo Conti[7]

Their weddings are celebrated with singing, feasting, and the sound of trumpets and flutes, for, with the exception of organs, all the other instruments in use among them for singing and playing are similar to our own. They make sumptuous feasts both day and night, at which there is both singing and instrumental music. Some sing, dancing in a circle, after our manner; while others sing forming a line in single file, one after the other, and exchanging little painted rods, of which each person carries two, with those whom they meet on turning [‘kolata’, an old folk dance of the south]; the effect of which he describes as being extremely pretty.

6. Women allowed many husbands in Calicut, Nicolo Conti[8]

In this district alone the women are allowed to take several husbands, so that some have ten and more. The husbands contribute amongst themselves to the maintenance of the wife, who lives apart from her husbands. When one visits her he leaves a mark at the door of the house, which being seen by another coming afterwards, he goes away without entering. The children are allotted to the husbands at the will of the wife. The inheritance of the father does not descend to the children, but to the grandchildren.

7. Customs at Calicut, Hieronimo di Santo Stefano[9]

Every lady may take to herself seven or eight husbands, according to her inclination. The men never marry any woman who is a virgin; but if one, being a virgin, is betrothed, she is delivered over before the nuptials to

some other person for fifteen or twenty days in order that she may be deflowered.

C. Sati

1. Widows and sati, Alberuni[10]

If a wife loses her husband by death, she cannot marry another man. She has only to choose between two things – either to remain a widow as long as she lives or to burn herself; and the latter eventuality is considered the preferable, because as a widow she is ill-treated as long as she lives. As regards the wives of the kings, they are in the habit of burning them, whether they wish it or not, by which they desire to prevent any of them by chance committing something unworthy of the illustrious husband. They make an exception only for women of advanced years and for those who have children; for the son is the responsible protector of his mother.

2. Sati, Odoric of Pordenone[11]

But the idolaters of this realm have one detestable custom (that I must mention). For when any man dies, they burn him, and if he leave a wife they burn her alive with him, saying that she ought to go and keep her husband company in the other world. But if the women have sons by her husband she may abide with them, an she will. And, on the other hand, if the wife die there is no law to impose the like on him; but he, if he if likes, can take another wife. It is also customary there for the women to drink wine and not the men. The women also have their foreheads shaven, whilst the men shave not the beard.

3. Sati in India the Less, Friar Jordanus[12]

In this India, on the death of a noble, or of any people of substance; their bodies are burned: and eke their wives follow them alive to the fire, and, for the sake of worldly glory, and for the love of their husbands, and for eternal life, burn along with them, with as much joy as if they were going to be wedded; and those who do this have the higher repute for virtue and perfection among the rest. Wonderful! I have sometimes seen for one dead man who was burnt, five living women take their places on the fire with him, and die with their dead.

4. Sati at Ajudahan, Ibn Battuta[13]

Two days later we reached Ajudahan [Pakpattan], a small town belonging to the pious Shaykh Farid ad-Din. As I returned to the camp after visiting this personage, I saw the people hurrying out, and some of our party along with them. I asked them what was happening and they told me that one of the Hindu infidels had died, that a fire had been kindled to burn him, and his wife would burn herself along with him. After the burning my companions came back and told me that she had embraced the dead man until she herself was burned with him. Later on I used often to see a Hindu woman, richly dressed, riding on horseback, followed by both Muslims and infidels and preceded by drums and trumpets; she was accompanied by Brahmans, who are the chiefs of the Hindus. In the sultan's dominions they ask his permission to burn her, which he accords them. The burning of the wife after her husband's death is regarded by them as a commendable act, but is not compulsory; only when a widow burns herself her family acquires a certain prestige by it and gain a reputation for fidelity. A widow who does not burn herself dresses in coarse garments and lives with her own people in misery, despised for her lack of fidelity, but she is not forced to burn herself.

At Am-jhera

Once in the town of Amjari [Am-jhera, near Dhar] I saw three women whose husbands had been killed in battle and who had agreed to burn themselves. Each one had a horse brought to her and mounted it, richly dressed and perfumed. In her right hand she held a coconut, with which she played, and in her left a mirror, in which she looked at her face. They were surrounded by Brahmans and their own relatives, and were preceded by drums, trumpets and bugles. Everyone of the infidels said to them "Take greetings from me to my father, or brother or mother, or friend" and they would say 'Yes' and smile at them. I rode out with my companions to see the way in which the burning was carried out.

After three miles we came to a dark place with much water and shady trees, amongst which there were four pavilions, each containing a stone idol. Between the pavilions there was a basin of water over which a dense shade was cast by trees so thickly set that the sun could not penetrate them. The place looked like a spot in hell – God preserve us from it! On reaching these pavilions they descended to the pool, plunged into it and divested

themselves of their clothes and ornaments, which they distributed as alms. Each one was then given an unsewn garment of coarse cotton and tied part of it round her waist and part over her head and shoulders. The fires had been lit near this basin in a low lying spot, and oil of sesam poured over them, so that the flames were increased. There were about fifteen men there with faggots of thin wood and about ten others with heavy pieces of wood, and the drummers and trumpeters were standing by waiting for the woman's coming. The fire was screened off by a blanket held by some men, so that she should not be frightened by the sight of it. I saw one of them, on coming to the blanket, pull it violently out of the men's hands, saying to them with a smile "Do you frighten me with the fire? I know that it is a fire, so let me alone." Thereupon she joined her hands above her head in salutation to the fire and cast herself into it. At the same moment the drums, trumpets and bugles were sounded, the men threw their firewood on her and the others put the heavy wood on top of her to prevent her moving, cries were raised and there was a loud clamour. When I saw this I had all but fallen off my horse, if my companions had not quickly brought water to me and laved my face, after which I withdrew.

5. Sati in Cambay, Nicolo Conti[14]

It is the custom when husbands die, for one or more of their wives to burn themselves with them, in order to add to the pomp of the funeral. She who was the most dear to the deceased, places herself by his side with her arm round his neck, and burns herself with him; the other wives, when the funeral pile is lighted, cast themselves into the flames.

6. Sati in Central India, Nicolo Conti[15]

In central India the dead are burned, and the living wives, for the most part, are consumed in the same funeral pyre with their husband, one or more, according to the agreement at the time the marriage was contracted. The first wife is compelled by the law to be burnt, even though she should be the only wife. But others are married under the express agreement that they should add to the splendour of the funeral ceremony by their death, and this is considered a great honour for them. The deceased husband is laid on a couch, dressed in his best garments. A vast funeral pyre is erected over him in the form of a pyramid, constructed of odoriferous woods. The pile being ignited, the wife, habited in her richest garments, walks gaily around

it, singing, accompanied by a great concourse of people, and amid the sounds of trumpets, flutes, and songs. In the meantime one of the priests, called Bachali, standing on some elevated spot, exhorts her to a contempt of life and death, promising her all kinds of enjoyment with her husband, much wealth, and abundance of ornaments. When she has walked round the fire several times, she stands near the elevation on which is the priest, and taking off her dress puts on a white linen garment, her body having first been washed according to custom. In obedience to the exhortation of the priest she then springs into the fire. If some show more timidity (for it frequently happens that they become stupefied by terror at the sight of the struggles of the others, or of their sufferings in the fire), they are thrown into the fire by the bystanders, whether consenting or not. Their ashes are afterwards collected and placed in urns, which form an ornament for the sepulchres.

7. Sati at Coromandel, Hieronimo di Santo Stefano[16]

Departing thence after twelve days we reached a port called Coromandel, where the red sandal wood tree grows in such abundance, that they build houses of it. The lord of this place is an idolater, like the preceding. There is another custom in practice here, that when a man dies and they prepare to burn him, one of his wives burns herself alive with him; and this is their constant habit.

D. Devadasis

1. In Gujarat, Chau Ju-kua[17]

There are four thousand Buddhist [?] temple buildings, in which live over twenty thousand dancing-girls who sing twice daily while offering food to the Buddha (i.e., the idols) and while offering flowers. When offering flowers they tie them in bunches with cotton thread, of which they use three hundred catties every day.

2. Dedicated to the Gods, Marco Polo[18]

In their temples there are many idols, the forms of which represent them of the male and the female sex; and to these, fathers and mothers dedicate their daughters. Having been so dedicated, they are expected to attend whenever the priests of the convent require them to contribute to the gratification of the idol; and on such occasions they repair thither, singing

and playing on instruments, and adding by their presence to the festivity. These young women are very numerous, and form large bands. Several times in the week they carry an offering of victuals to the idol to whose service they are devoted, and of this food they say the idol partakes. A table for the purpose is placed before it, and upon this the victuals are suffered to remain for the space of a full hour; during which damsels never cease to sing, and play, and exhibit wanton gestures. This lasts as long as a person of condition would require for making a convenient meal. They then declare that the spirit of the idol is content with its share of the entertainment provided, and, ranging themselves around it, they proceed to eat in their turn; after which they repair to their respective homes.

E. House of prostitution

At Vijayanagar, Abder Razzak[19]

Opposite the *darab-khaneh* (the mint) is the house of the Governor, where are stationed twelve thousand soldiers as a guard, who receive every day a payment of twelve thousand *fanom,* levied on the receipts of the houses of prostitution. The magnificence of the places of this kind, the beauty of the young girls collected therein, their allurements, and their coquetry, surpass all description. I will confine myself to the description of some particulars. Behind the *darab-khaneh* is a sort of bazaar, which is more than three hundred *ghez* in length, and more than twenty in breadth. On two sides are ranged chambers and *estrades;* in front of them are erected, in the form of thrones, several platforms constructed of beautiful stones. On the two sides of the avenue formed by the chambers are represented figures of lions, panthers, tigers, and other animals. All are so well drawn, and their movements have so natural an appearance, that you would think these animals were alive. Immediately after midday prayer they place before the doors of the chambers, which are decorated with extreme magnificence, thrones and chairs, on which the courtezans seat themselves. Each of these women is bedecked with pearls and gems of great value, and is dressed in costly raiment. They are all extremely young, and of perfect beauty. Each one of them has by her two young slaves, who give the signal of pleasure, and have the charge of attending to everything which can contribute to amusement. Any man may enter into this locality, and select any girl that

pleases him, and take his pleasure with her. Anything that he carries about with him is delivered into the keeping of these engaged in the service of the houses of prostitution; and if anything is lost, these latter are responsible for it.

Each of the seven fortresses alike contains a great number of places of prostitution, and their general proceeds amount to twelve thousand *fanom*, which forms the pay allotted to the guards. These latter have it assigned to them as a duty to make themselves acquainted with every event which occurs within the fortresses*;* if any article is lost or stolen by thieves it is their place to report it; if not they are bound to make it good. Some slaves which had been bought by my companions, had run away. Information was given of the circumstance to the governor, who gave orders to the superintendents of the quarter in which we lived to bring back the fugitives or to make good the loss. These guards, on being informed of the value of the slaves, paid up the amount.

❑

CHAPTER — 9

Hindu Rulers

A. The kings of India
B. Pulakesin II
C. Rai Dahir
D. The Rashtrakutas
E. Al-Jurz
F. The Kings of Bengal
G. The Kingdom of Lakhimpur
H. The Kingdom of Tafar
I. The Kingdom of Kashbin
J. The Kingdom of Kiranj
K. The Kingdom of Kanauj
L. The Chola kingdom
M. The Kingdom of Telingana
N. The Kingdom of Nairs
O. The Kingdom of Mabar
P. Kings of India the Greater
Q. The Zamorin
R. The King of Vijayanagar
S. The King of Cochin
T. The King of Calicut

A. The kings of India

1. Richly adorned, Abu Zaidu-l Hasan, of Sira[1]

The kings of India are accustomed to wear earrings of precious stones, mounted in gold. They also wear necklaces of great value, formed of the most precious red and green stones. Pearls, however are held in the highest esteem, and are greatly sought after…

2. Indian kings maintain large armies, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[2]

The Indian kings possess large armies, but they do not maintain them. Whenever a king calls them to fight, they do so and maintain themselves

with their own money; the king has no liability in this regard. But the Chinese pay [money] to them as the Arabs do.

B. Pulakesin II

The Sassanian monarch, Khusru II, to his sons on an astrological prediction sent by Pulakesin II [as recorded by the Persian historian, Tabari; A.D. 838-923][3]

Two years ago, Pulakesi, King of India, sent to us, in the thirty-sixth year of our reign, ambassadors carrying a letter imparting to us various news, and presents for us, for you, and our other sons. He also wrote a letter to each of you. To you he presented – don't you remember it? – an elephant, a sword, a white falcon and a piece of gold brocade. When we looked at the presents and at the letters, we remarked that yours bore the mark 'Private' on the cover in the Indian language. Then we ordered that the presents and other letters should be delivered to each of you, but we kept back your letter, on account of the remark written on the outside. We then sent for an Indian scribe, had the seal broken, and the letter read. The contents were : 'Rejoice and be of good cheer, for on the day Dai ba Adhar, of the thirty-eighth year of the reign of Chosroes thou wilt be crowned king and become ruler of the whole empire. Signed, Pulakesi.' But we closed this letter with our seal, and gave it into the keeping of our consort Shirin.

C. Rai Dahir

1. Dahir fights Muhammad Kasim, *Chach-Nama*[4]

Historians have related that Dahir was slain at the fort of Rawar at sunset, on Thursday, the 10th of Ramazan, in the year 93 (June, 712 A.D.). Abu-l Hasan relates upon the authority Abu-l Lais Hindi, who heard it from his father, that when the army of Islam made the attack, and most of the infidels were slain, a noise arose upon the left, and Dahir thought it came from his own forces. He cried out, "Come hither; I am here." The women then raised their voices, and said, "O king, we are your women, who have fallen into the hands of the Arabs, and are captives." Dahir said, "I live as yet, who cap-tured you?" So saying, he urged his elephant against the Musulman army. Muhammad Kasim told the naphtha throwers that the opportunity was theirs, and a powerful man, in obedience to this direction, shot his

naphtha arrow into Dahir's howda, and set it on fire. Dahir ordered his elephant driver to turn back, for the elephant was thirsty, and the howda was on fire. The elephant heeded not his driver, but dashed into the water, and in spite of all the efforts of the man, refused to turn back. Dahir and the driver were carried into the rolling waves. Some of the infidels went into the water with them, and some stood upon the banks; but when the Arab horsemen came up, they fled. After the elephant had drunk water, he wanted to return to the fort. The Muhammadan archers plied their weapons, and a rain of arrows fell around. A skilful bowman aimed an arrow, which struck Dahir in the breast *(bar dil),* and he fell down in the howda upon his face. The elephant then came out of the water and charged. Some of the infidels who remained were trampled under foot, and the others were dispersed. Dahir got off his elephant, and confronted an Arab; but this brave fellow struck him with a sword in the very centre of his head, and cleft it to his neck. The Muhammadans and infidels closed and maintained a deadly fight, until they reached the fort of Rawar. When the Brahmans who had gone into the water found the place of Dahir fall deserted, they came out and hid the body of Dahir under the bank. The white elephant turned towards the army of the infidels, and no trace was left.

2. Jaisiya enters the fort of Rawar and prepares to fight, *Chach-Nama*[5]

When the news of the death of Dahir arrived, and that the white elephant was hamstrung, Jaisiya, son of Dahir said that he would go to oppose the enemy, and strike a blow to save his honour and name, for it would be no loss if he were to be slain. Sisakar, the minister, observed that the resolve of the prince was not good, the king had been killed, the army defeated and dispersed, and their hearts were averse to battle through fear of the enemy's sword. How could he go to fight with the Arabs? His dominions still existed, and the strongest forts were garrisoned with brave warriors and subjects. It was, therefore, advisable that they should go to the fort of Brahmanabad, which was the inheritance of his father and ancestors. It was the chief residence of Dahir. The treasuries and stores were full, and the inhabitants of the place were friends and well wishers of the family of Chach, and would all assist in fighting against the enemy. Then the Allafi was also asked what he considered proper. He replied that he concurred in this opinion. So Jaisiya assented, and with all their dependants and trusty

servants, they went to Brahmanabad. Bai (Main), the wife of Dahir, together with some of the generals, prepared for battle. She reviewed the army in the fort, and fifteen thousand warriors were counted. They had all resolved to die. Next morning, when it was learnt that Dahir had been killed between the Mihran and the stream called Wadhawah, all the chiefs (Rawats) and officers who were attached to the Rani entered the fort. Muhammad Kasim, on receiving the intelligence, marched in that direction, and encamped under the walls. The garrison began to beat drums and sound clarions, and threw down from the ramparts and bastions stones from mangonels and balistas as well as arrows and javelins.

3. The fort is taken and Bai [Main], the sister of Dahir, burns herself, *Chach-Nama*[6]

Muhammad Kasim disposed his army, and ordered the miners to dig and undermine the walls. He divided his army into two divisions; one was to fight during the day with mangonels, arrows, and javelins, and the other to throw naphtha, fardaj (?), and stones during the night. Thus the bastions were thrown down. Bai (Main), the sister of Dahir, assembled all her women, and said, "Jaisiya is separated from us, and Muhammad Kasim is come. God forbid that we should owe our liberty to these outcast cow-eaters! Our honour would be lost! Our respite is at an end, and there is nowhere any hope of escape; let us collect wood, cotton, and oil, for I think that we should burn ourselves and go to meet our husbands. If any wish to save herself she may." So they went into a house, set it on fire, and burnt themselves. Muhammad took the fort, and stayed there for two or three days. He put six thousand fighting men, who were in the fort, to the sword, and shot some with arrows. The other dependants and servants were taken prisoners, with their wives and children.

4. Slaves, cash, taken by Kasim, *Chach-Nama*[7]

It is said that when the fort was captured, all the treasures, property, and arms, except those which were taken away by Jaisiya, fell into the hands of the victors, and they were all brought before Muhammad Kasim. When the number of the prisoners was calculated, it was found to amount to thirty thousand persons, amongst whom thirty were the daughters of chiefs, and one of them was Rai Dahir's sister's daughter, whose name was Jaisiya [Hasna?]. They were sent to Hajjaj. The head of Dahir and the fifth part of

the prisoners were forwarded in charge of K'ab, son of Maharak. When the head of Dahir, the women, and the property all reached Hajjaj, he prostrated himself before God, offered thanksgivings and praises, for, he said, he had in reality obtained all the wealth and treasures and dominions of the world.

5. Resistance offered by Dahir's son and wife, *Chach-Nama*[8]

It is said, on the authority of the old men of Brahmanabad, that when the fort of Brahmanabad was taken, Ladi, the wife of Dahir Rai, who since Dahir's death had staid in the fort with his son, rose up and said, "How can I leave this strong fort and my family. It is necessary that we should stop here, overcome the enemy, and preserve our homes and dwelling. If the army of the Arabs should be successful, I must pursue some other course. She then brought out all her wealth and treasures, and distributing them among the warriors of the army, she thus encouraged her brave soldiers while the fight was carried on at one of the gates. She had determined that if the fort should be lost, she would burn herself alive with all her relations and children. Suddenly the fort was taken, and the nobles came to the gate of Dahir's palace and brought out his dependants. Ladi was taken prisoner.

6. Ladi, the wife of Dahir taken prisoner along with his two maiden daughters, *Chach-Nama*[9]

When the plunder and the prisoners of war were brought before Kasim, and enquiries were made about every captive, it was found that Ladi, the wife of Dahir, was in the fort with two daughters of his by his other wives. Veils were put on their faces, and they were delivered to a servant to keep them apart. One-fifth of all the prisoners were chosen and set aside; they were counted as amounting to twenty thousand in number, and the rest were given to the soldiers.

Protection is given to the artificers

Protection was given to the artificers, the merchants, and the common people, and those who had been seized from those classes were all liberated. But he (Kasim) sat on the seat of cruelty, and put all those who had fought to the sword. It is said that about six thousand fighting men were slain, but, according to some, sixteen thousand were killed, and the rest were pardoned.

7. Relations of Dahir betrayed, *Chach-Nama*[10]

It is related that when none of the relations of Dahir were found among the prisoners, the inhabitants of the city were questioned respecting them, but no one gave any information or hint about them. But the next day nearly one thousand Brahmans, with shaven heads and beards, were brought before Kasim.

Brahmans came to Muhammad Kasim

When Muhammad Kasim saw them, he asked to what army they belonged, and why they had come in that manner. They replied, "O faithful noble! our king was a Brahman. You have killed him, and have taken his country; but some of us have faithfully adhered to his cause, and have laid down our lives for him; and the rest, mourning for him, have dressed themselves in yellow clothes, and have shaved their heads and beards. As now the Almighty God has given this country into your possession, we have come submissively to you, just Lord, to know what may be your orders for us." Muhammad Kasim began to think, and said, "By my soul and head, they are good, faithful people. I give them protection, but on this condition, that they bring hither the dependents of Dahir, wherever they may be." Thereupon they brought out Ladi. Muhammad Kasim fixed a tax upon all the subjects, according to the laws of the Prophet. Those who embraced the Muhammadan faith were exempted from slavery, the tribute, and the poll-tax; and from those who did not change their creed a tax was exacted according to three grades. The first grade was of great men, and each of these was to pay silver, equal to forty-eight dirams in weight, the second grade twenty-four dirams, and the lowest grade twelve dirams. It was ordered that all who should become Musulmans at once should be exempted from the payment, but those who were desirous of adhering to their old persuasion must pay the tribute and poll-tax. Some showed an inclination to abide by their creed, and some having resolved upon paying tribute, held by the faith of the forefathers, but their lands and property were not taken from them.

8. Order from the Capital to Muhammad Kasim, *Chach-Nama*[11]

…when Rai Dahir was killed, his two virgin daughters were seized in his palace, and Muhammad Kasim had sent them to Baghdad under the care of his negro slaves. The Khalifa of the time sent them into his harem to be taken care of for a few days till they were fit to be presented to him. After

some time, the remembrance of them recurred to the noble mind of the Khalifa, and he ordered them both to be brought before him at night. Walid ‘Abdul Malik told the interpreter to inquire from them which of them was the eldest, that he might retain her by him, and call the other sister at another time. The interpreter first asked their names. The eldest said, “My name is Suryadeo,” and the youngest replied, “my name is Parmaldeo.” He called the eldest to him, and the youngest he sent back to be taken care of. When he had made the former sit down, and she uncovered her face, the Khalifa of the time looked at her, and was enamoured of her surpassing beauty and charms. Her powerful glances robbed his heart of patience. He laid his hand upon Suryadeo and drew her towards him. But Suryadeo stood up, and said, “Long live the king! I am not worthy the king’s bed, because the just Commander Imadu-d-Din Muhammad Kasim kept us three days near himself before he sent us to the royal residence. Perhaps it is a custom among you; but such ignominy should not be suffered by kings.” The Khalifa was overwhelmed with love, and the reins of patience had fallen from his hand. Through indignation he could not stop to scrutinize the matter. He asked for ink and paper, and commenced to write a letter with his own hand, commanding that at whatever place Mu-hammad Kasim had arrived, he should suffer himself to be sewed up in a hide and sent to the capital.

9. Muhammad Kasim reaches Udhafar, and receives the order from the Khalifa’s capital, *Chach-Nama*[12]

When Muhammad Kasim received the letter at Udhafar, he gave the order to his people and they sewed him up in a hide, put him in a chest, and sent him back. Muhammad Kasim thus delivered his soul to God. The officers who were appointed to the different places remained at their stations, while he was taken in the chest to the Khalifa of the time. The private chamberlain reported to Walid ’Abdul-Malik, son of Marwan, that Muhammad Kasim Sakifi had been brought to the capital. The Khalifa asked whether he was alive or dead. It was replied, “May the Khalifa’s life, prosperity, and honour be prolonged to eternity. When the royal mandates were received in the city of Udhapur, Muhammad Kasim immediately, according to the orders, had himself sewed up in a raw hide, and after two days delivered his soul to God and went to the eternal world. The

authorities whom he had placed at different stations maintain the country in their possession, the Khutba continues to be read in the name of the Khalifa, and they use their best endeavours to establish their supremacy."

10. The Khalifa opens the chest, *Chach-Nama*[13]

The Khalifa then opened the chest and called the girls into his presence. He had a green bunch of myrtle in his hand, and pointing with it towards the face of the corpse, said, "See, my daughters, how my commands which are sent to my agents are observed and obeyed by all. When these my orders reached Kanauj, he sacrificed his precious life at my command."

11. The address of Janki, daughter of Dahir, to Khalifa 'Abdu-l Malik, son of Marwan, *Chach-Nama*[14]

Then the virtuous Janki [different from the name she first gave the Khalifa] put off the veil from her face, placed her head on the ground, and said, "May the king live long, may his prosperity and glory increase for many years; and may he be adorned with perfect wisdom. It is proper that a king should test with the touchstone of reason and weigh in his mind whatever he hears from friend or foe, and when it is found to be true and indubitable, then orders compatible with justice should be given. By so doing he will not fall under the wrath of God, nor be contemned by the tongue of man. Your orders have been obeyed, but your gracious mind is wanting in reason and judgement. Muhammad Kasim respected our honour, and behaved like a brother or son to us, and he never touched us, your slaves, with a licentious hand. But he had killed the king of Hind and Sind, he had destroyed the dominion of our forefathers, and he had degraded us from the dignity of royalty to a state of slavery, therefore, to retaliate and to revenge these injuries, we uttered a falsehood before the Khalifa, and our object has been fulfilled. Through this fabrication and deceit have we taken our revenge. Had the Khalifa not passed such peremptory orders; had he not lost his reason through the violence of his passion, and had he considered it proper to investigate the matter, he would not have subjected himself to this repentance and reproach; and had Muhammad Kasim, assisted by his wisdom, come to within one day's journey from this place, and then have put himself into a hide, he would have been liberated after inquiry, and not have died." The Khalifa was very sorry at this explanation, and from excess of regret he bit the back of his hand.

Janki again addressed the Khalifa

Janki again opened her lips and looked at the Khalifa. She perceived that his anger was much excited, and she said, "The king has committed a very grievous mistake, for he ought not, on account of two slave girls, to have destroyed a person who had taken captive a hundred thousand modest women like us, who had brought down seventy chiefs who ruled over Hind and Sind from their thrones to their coffins; and who instead of temples had erected mosques, pulpits, and minarets. If Muhammad Kasim had been guilty of any little neglect or impropriety, he ought not to have been destroyed on the mere word of a designing person." The Khalifa ordered both the sisters to be enclosed between walls. From that time to this day the flags of Islam have been more and more exalted every day, and are still advancing.

D. The Rashtrakutas

1. Balahara – fourth greatest king in the world, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[15]

The Indians and the Chinese are in agreement that the number of the kings of the world is four. The first of these four that they count is the king of the Arabs. There is a consensus amongst them, and there is no difference of opinion in that he is the greatest of the kings; that he is the richest and the most magnificent; and that he is the king of the great faith above which there is nothing else. Then the king of China counts himself as the next [king] after the king of the Arabs; then the king of al-Rum; then Ballahara, the king of the [people] whose ears are perforated.

As for this Ballahara, verily he is the noblest among the Indians, and they acknowledge his nobility. Each one of the kings of India is the sovereign of his own country, but they acknowledge his suzerainty. Thus, when his ambassadors visit other kings, they pay homage to his ambassadors as a mark of respect for him. This king pays allowances [to the soldiers] as the Arabs do. He possesses a large number of horses and elephants and has abundance of riches. His wealth consists of *dirhams* called *al-Tatariya.* Each *dirham* weighs a *dirham* and a half of the royal currency. The date of his [reign] in the year of his rule is (determined) by the death of the previous [ruler]. It is unlike the tradition of the Arabs whose [calendar is

determined] from the period of the Prophet (May Peace be Upon Him). On the other hand, their calendar is [fixed] according to [the reign] of the kings. Their kings have long lives, and sometimes a king rules for fifty years.

2. Greatest king of India, Ibn Khurdadhbih[16]

The greatest king of India is Balhara [the Rashtrakuta ruler, Govinda III], that is to say, 'the king of kings'. Among the other kings of India are: Jaba [hill state of Chamba], the king of al-Taqa [between the Beas and Indus], the king of al-Jurz, [Nagabhatta II of the Pratihara dynasty], Ghaba [Jaba], Rahma [Dharmapala of the Pala dynasty], and the king of Qamrun [Kamarupa]…

The greatest king of India is Balhara which means 'the king of kings'. His signet-ring has the following engraved on it: 'Anyone who loves you with a purpose will turn his back up on you as soon as it is served.' He resides in al-Kumkam, the land of teak-wood. He is followed by the King of al-Taqa; then comes Jaba; then after him comes the King of al-Jurzj; he uses the *Tatariya dirhams* [as his currency]. He is followed by Ghaba (Jaba); and then comes Rahma (Dharma). Between his kingdom and those of the others there is a journey of one year. It is related that he possesses fifty thousand elephants. In his kingdom are found the cotton-velvet cloth and the Indian aloes-wood. Then comes the king of Qamrun (Qamarub). His kingdom adjoins China. In his country there is abundant gold and rhinoceros. This animal has a single horn in his forehead, which is one cubit long and two handfuls in thickness. One usually finds inside it an image from one end of the horn to the other, so that when it is ripped open you will see the white image on a jet-black background having the shape of either a human being, an animal, fish, peacock, or some other bird. The Chinese make girdles out of it, and the price of each one ranges from three hundred to three thousand or up to four thousand *dinars.* All the above-mentioned kings have perforated ears.

3. Kings of India turn their faces towards him in their prayers, Al Masudi[17]

The greatest of the kings of India in our time is the Balhara [Indra III], sovereign of the city of Mankir. Many of the kings of India turn their faces towards him in their prayers, and they make supplications to his ambassadors, who come to visit them. The kingdom of Balhara is bordered

by many other countries of India. Some kings have their territory in the mountains away from the sea, like the Rai, King of Kashmir, the King of Tafan, and others. There are other kings who possess both land and sea. The capital of the Balhara is eighty Sindi parasangs from the sea, and the parasang is equal to eight miles. His troops and elephants are innumerable, but his troops are mostly infantry, because the seat of his government is among the mountains.

4. Balhara possesses many war elephants, Al Masudi[18]

Of all the kings of Sind and India, there is no one who pays greater respect to the Musulmans than the Balhara. In his kingdom Islam is honoured and protected...The money consists of dirhams, called Tahiriya, each weighing a dirham and a half. They are impressed with the date of the reign, The Balhara possesses many war elephants. This country is also called Kamkar. On one side it is exposed to the attacks of the king of Juzr [Guzerat]; a king who is rich in horses and camels, and has a large army.

5. Balhara has an extensive territory, Abu Ishak al Istakhri[19]

From Kambaya to Saimur is the land of the Balhara, and in it there are several Indian kings. It is a land of infidels, but there are Musalmans in its cities, and none but Musalmans rule over them on the part of the Balhara. There are Jama masjids in them. The city in which the Balhara dwells is Mankir, which has an extensive territory.

E. Al-Jurz [al-Jurzara, Gurjara]

1. Gujara-desa, *Akhbar Al-Sin wa'l Hind,* An Account of China and India[20]

Among them there is a king who is called the king of al-Jurz. He has a large army, and none [of the kings] of India has a cavalry comparable to his. He is an enemy of the Arabs, but he acknowledges that the king of the Arabs is the greatest king. And among the Indian [kings] none is a greater enemy of Islam than he is. His [kingdom] lies on 'a tongue of the land'. The kingdom has abundance of wealth and numerous camels and cattle. The commercial means of exchange in it are the silver ingots, and it is said that the kingdom has [silver] mines. There is no place in India more secure than this from theft.

2. The king of Jurz, Sulaiman[21]

This king [of Jurz] maintains numerous forces, and no other Indian prince has so fine a cavalry. He is unfriendly to the Arabs, still he acknowledges that the king of the Arabs is the greatest of kings. Among the princes of India there is no greater foe of the Muhammadan faith than he. His territories form a tongue of land. He has great riches, and his camels and horses are numerous. Exchanges arc carried on in his state with silver (and gold) in dust, and there are said to be mines (of these metals) in the country. There is no country in India more safe from robbers.

F. Kings of Bengal

1. King called Dharma, *Akhbar Al-Sin wa'l Hind*, An Account of China and India[22]

Adjacent to them is a king called Dharma with whom the king of al-Jurz wages wars, but he is not superior in sovereignty; he also carries on wars with Ballahara as he does with the king of al-Jurz. This Dharma has a larger army as compared to the King Ballahara, the king of al-Jurz and the King al-Taqa. It is said that when he goes out for a combat he carries about fifty thousand elephants, and he does not go [to war] except in the winter season, for the elephants cannot endure thirst. Hence he is not able to go [to war] except in winter. It is said that the number of the washermen of his army is about ten to fifteen thousand.

Cloth so fine as passes through ring

In his country one finds cloth, the like of which is not found in any other [kingdom]. A piece of this cloth can be passed through the circle of a ring as it is so fine and beautiful. It is made of cotton, and we have seen some of them. In his country cowry-shell is used which is the money of the land, that is to say, his wealth. In his country there is also gold, silver, aloes-wood and *al-samar* cloth from which the fly-whisk is made.

2. Tripartite struggle, Sulaiman[23]

These three states border on a kingdom called Ruhmi, which is at war with that of Jurz. The king is not held in very high estimation. He is at war with the Balhara as he is with the king of Jurz. His troops are more numerous than those of the Balhara, the king of Jurz, or the king of Tafak.

3. Rahma has more troops than the Balhara, Al Masudi[24]

Beyond this kingdom is that of Rahma, which is the title for their kings, and generally at the same time their name. His dominions border on those of the king of Juzr [Guzerat], and, on one side, on those of the Balhara, with both of whom he is frequently at war. The Rahma has more troops, elephants, and horses, than the Balhara, the king of Juzr and of Tafan. When he takes the field, he has no less than fifty thousand elephants. He never goes to war but in winter, because elephants cannot bear thirst. His forces are generally exaggerated; some assert that the number of fullers and washers in his camp is from ten to fifteen thousand...The kingdom of Rahma extends both along the sea and the continent. It is bounded by an inland state called the kingdom of Kaman. The inhabitants are fair, and have their ears pierced. They have elephants, camels, and horses. Both sexes are generally handsome.

4. Rai Lakhmaniya of Bengal [twelfth century], Minhaju-s Siraj[25]

He was a great Rai, and had sat upon the throne for a period of eighty years. A story about that Rai may be here related:

When the father of the Rai departed this world, he was in the womb of his mother, so the crown was placed upon her belly, and all the great men expressed their loyalty before her. His family was respected by all the Rais or chiefs of Hindustan, and was considered to hold the rank of Khalif, or sovereign. When the time of the birth of Lakhmaniya drew near, and symptoms of delivery appeared, his mother assembled the astrologers and Brahmans, in order that they might see if the aspect of the time was auspicious. They all unanimously said that if the child were born at that moment it would be exceedingly unlucky, for he would not become a sovereign. But that if the birth occurred two hours later the child would reign for eighty years. When his mother heard this opinion of the astrologers, she ordered her legs to be tied together, and caused herself to be hung with her head downwards. She also directed the astrologers to watch for the auspicious time. When they all agreed that the time for delivery was come, she ordered herself to be taken down, and Lakhmaniya was born directly, but he had no sooner come into the world than his mother died from the anguish she had endured. Lakhmaniya was placed upon the throne, and he ruled for eighty years. It is said by trustworthy persons that no one,

great or small, ever suffered injustice at his hands. He used to give a lac to every person that asked him for charity; as was also the custom of the generous Sultan, the Hatim of the time, Kutbu-d din. In that country the current money is *kaudas* (kauris) instead of *chitals*, and the smallest present he made was a lac of *kaudas*…

G. Kingdom of Lakhimpur

1. Kingdom in interior, *Akhbar Al-Sin wa'l Hind,* An Account of China and India[26]

Next to him is a king whose [kingdom] is in the interior. He has no [access] to the sea. He is called the King of Lakshmibur. The [inhabitants of this realm] are white people; they have pierced ears and are handsome. They are the dwellers of deserts and mountains.

2. Kingdom borders on China, Ibn Khurdadhib[27]

The king of Assam (Qamrun) is a king of *al-Hind*…whose kingdom borders on China and abounds in gold.

H. Kingdom of Tafar

The state of Tafar, Sulaiman[28]

By the side of this kingdom lies that of Tafak, which is but a small state. The women are white, and the most beautiful in India. The king lives at peace with his neighbours, because his soldiers are so few. He esteems the Arabs as highly as the Balhara does.

I. Kingdom of Kashmir

Powerful king, *Chach-Nama*[29]

…the king of Kashmir who is the mighty possessor of a crown, kettledrums and standards, on whose royal threshold the other kings of Hind have placed their heads, who sways the whole of Hind and even the country of Makran and Turan, whose chains many grandees and lords have willingly placed on their knees…

J. Kingdom of Kiranj

1. A kingdom called Kiranj, Sulaiman[30]

Afterwards comes a sea, on the shores of which there is a kingdom called Kiranj [the country of Kalinga on that coast?]. Its king is poor and proud. He collects large quantities of amber, and is equally well provided with elephant's teeth. They eat pepper green in this country because it is scarce.

2. The kingdom of Firanj, Al Masudi[31]

Afterwards comes the kingdom of Firanj, which has power both on land and sea. It is situated on a tongue of land which stretches into the sea, from whence large quantities of amber are obtained. The country produces only little pepper, but large numbers of elephants are found here. The king is brave, haughty, and proud, but to tell the truth he has more haughtiness than power, and more pride than courage.

K. Kingdom of Kanauj

1. Centre of learning, Abu Zayd[32]

…poets, astronomers, philosophers and diviners [are concentrated above all] in Kanauj, a large country forming the kingdom of al-Jurz.

2. Bhaura [Mihir Bhoja the great ruler of the Gurjara-Pratihara dynasty?], Al Masudi[33]

One of the neighbouring kings of India, who is far from the sea, is the Bauura, who is lord of the city of Kanauj. This is the title given to all the sovereigns of that kingdom. He has large armies in garrisons on the north and on the south, on the east and on the west, for he is surrounded on all sides by warlike kings…

The kingdom of the Bauura, king of Kanauj, extends about one hundred and twenty square parasangs of Sind, each parasang being equal to eight miles of this country. This king has four armies, according to the four quarters of the wind. Each of them numbers 700,000 or 900,000 men. The army of the north wars against the prince of Multan, and with the Musulmans, his subjects, on the frontier. The army of the south fights against the Balhara, king of Mankir. The other two armies march to meet enemies in every direction.

3. Kanauj, Alberuni[34]

The middle of *al-Hind* is the country around Kanauj, which they call *Madhyadesha*, i.e., the middle of the realm. It is the middle or centre from a

geographical point of view, in so far as it lies halfway between the sea and the mountains, in the midst between the hot and the cold provinces, and also between the eastern and western frontiers of *al-Hind*. But it is a political centre too, because in former times it was the residence of their famous heroes and kings.

L. The Chola Kingdom

1. War elephants in Chola dominions, Chau Ju-Kua[35]

"The country is at war with the kingdoms of the west (of India?). The government owns sixty thousand war elephants, every one seven or eight feet high. When fighting these elephants carry on their backs houses, and these houses are full of soldiers who shoot arrows at long range, and fight with spears at close quarters. When victorious, the elephants are granted honorary names to signalize their merit."

2. Embassies from Coromandel to China, Chau Ju-Kua[36]

In former times they did not send tribute to our court, but "in the eighth year of the *ta-chung* and *siang-Iu* periods (A.D. 1015), its sovereign sent a mission with pearls and like articles as tribute. The interpreters, in translating their speech, said they wished to evince the respect of a distant nation for (Chinese) civilisation." They were ordered by Imperial decree to remain in waiting at the side gate of the Palace, and to be entertained at a banquet by the Associates in the College of Court Annalists. By Imperial favour they were ranked with envoys of K'iu-tz-'i. It happened to be the Emperor's birthday, and the envoys had a fine opportunity to witness the congratulations in the Sacred Enclosure.

"In the tenth year *si-ning* (1077) they again sent tribute of native produce. The Emperor Shun-tsung sent an officer of the Inner Department (i.e., a Chamberlain) to bid them welcome."

3. Feasts in Chola dominions, Ma Twan-lin[37]

During feasts, the king and the four great officers salute each other, crossing their hands, and inclining the body like the Buddhist priests; then they all sit together. They eat meat, but they do not drink wine. They have different sorts of soups, cakes and particular dishes of very good taste. They wear cotton clothes. The feast is accompanied by music, singing and dances. The service is done by women.

M. Kingdom of Telingana

***Akhbar Al-Sin wa'l Hind*, An Account of China and India**[38]

[The king is] called al-Tanluwing. He is poor but arrogant. He gets plenty of ambergris and has elephant tusks. He has black pepper which is eaten fresh because of its scarcity there.

N. The king of Nan-p'i country [the country of Nairs, Malabar]

Ruler goes barefoot, Chau Ju-Kua[39]

The ruler of the country has his body draped, but goes barefooted. He wears a turban and a loin-cloth, both of white cotton cloth. Sometimes he wears a white cotton shirt with narrow sleeves. When going out he rides an elephant, and wears a golden hat ornamented with pearls and gems.

On his arm is fastend a band of gold, and around his leg is a golden chain. Among his regalia is a standard of peacock feathers on a staff of vermilion colour; over twenty men guard it round.

Women Guards

He is attended by a guard of some five hundred picked foreign women, chosen for their fine physique. Those in front lead the way with dancing, their bodies draped, barefooted and with a cotton loincloth. Those behind ride horses bareback; they have a loincloth, their hair is done up and they wear necklaces of pearls and anklets of gold, their bodies are perfumed with camphor and musk and other drugs, and umbrellas of peacock feathers shield them from the sun.

In front of the dancing-women are carried the officers of the king's train, seated in litters of white foreign cotton, and which are called *pu-tai-kiau* [manjil, a kind of hammock-litter] and are borne on poles plated with gold and silver.

O. The Kingdom of Mabar

1. Knights in Mabar die with king, Marco Polo[40]

The king [of Mabar] retains about his person many knights, who are distinguished by an appellation, signifying "the devoted servants of his

majesty, in this world and the next." These attend upon his person at court, ride by his side in processions, and accompany him on all occasions. They exercise considerable authority in every part of the realm. Upon the death of the king, and when the ceremony of burning his body takes place, all these devoted servants throw themselves into the same fire, and are consumed with the royal corpse; intending by this act to bear him company in another life.

The following custom likewise prevails. When a king dies, the son who succeeds him does not meddle with the treasure which the former had amassed, under the impression that it would reflect upon his own ability to govern, if being left in full possession of the territory, he did not show himself as capable of enriching the treasury as his father was. In consequence of this prejudice it is supposed that immense wealth is accumulated by successive generations.

2. The king, Marco Polo[41]

The king is extremely rich and powerful, and has much delight in the possession of pearls and valuable stones. When the traders from Maabar present to him such as are of superior beauty, he trusts to their word with respect to the estimation of their value, and gives them double the sum that each is declared to have cost them. Under these circumstances, he has the offer of many fine jewels.

3. Royal horses, Marco Polo[42]

No horses being bred in this country, the king and his three royal brothers expend large sums of money annually in the purchase of them from merchants of Ormus, Diufar, Pecher, and Adem, who carry them thither for sale, and become rich by the traffic, as they import to the number of five thousand, and for each of them obtain five hundred saggi of gold, being equal to one hundred marks of silver. At the end of the year, in consequence, as it is supposed, of their not having persons properly qualified to take care of them or to administer the requisite medicines, perhaps not three hundred of these remain alive, and thus the necessity is occasioned for replacing them annually. But it is my opinion that the climate of the province is unfavorable to the race of horses, and that from hence arises the difficulty in breeding or preserving them. For food they give them flesh dressed with rice and other prepared meats, the country not

producing any grain besides rice. A mare, although of a large size, and covered by a handsome horse, produces small ill-made colt, with distorted legs, and unfit to be trained for riding.

4. The rulers of Mabar, Abdu-Llah, Wassaf[43]

Mabar extends in length from Kulam to Nilawar (Nellore), nearly three hundred parasangs along the seacoast, and in the language of that country the king is called Dewar, which signifies the Lord of Empire. The curiosities of Chin and Machin, and the beautiful products of Hind and Sind, laden on large ships (which they call junks), sailing like mountains with the wings to the wind on the surface of the water, are always arriving there. The wealth of the Isles of the Persian Gulf in particular, and in part the beauty and adornment of other countries, from 'Irak and Khurasan as far as Rum and Europe, are derived from Ma'bar, which is so situated as to be the key of Hind.

Sundar Pandi

A few years since the Dewar was Sundar Pandi who had three brothers, each of whom established himself in independence in some different country. The eminent prince, the margrave *(marzban)* of Hind, Takiu-d din 'Abdu-r Rahman, son of Mu-hammadu-t Tibi, whose virtues and accomplishments have for a long time been the theme of praise and admiration among the chief inhabitants of that beautiful country, was the Dewar's deputy, minister, and adviser, and was a man of sound judgement. Fitan, Mali Fitan and Kabil were made over to his possession, for he is still worthy *(kabil)* of having the Khutba read in his name, and, notwithstanding these high dignities, is not worthy of seditions *(fitna)*.

Horses imported

It was a matter of agreement that Maliku-l Islam Jamalu-d din and the merchants should embark every year from the island of Kais and land at Ma'bar 1,400 horses of his own breed, and of such generous origin that, in comparison with them the most celebrated horses of antiquity, such as the Rukhs of Rustam, etc., should be as worthless as the horse of the chessboard. It was also agreed that he should embark as many as he could procure from all the isles of Persia, such as Katif, Lahsa, Bahrein, Hurmuz and Kulhatu. The price of each horse was fixed from of old at 220 dinars of red gold, on this condition, that if any horses should sustain any injury

during the voyage, or should happen to die, the value of them should be paid from the royal treasury. It is related by authentic writers, that in the reign of Atabak Abu Bakr, 10,000 horses were annually exported from these places to Ma'bar, Kambayat, and other ports in their neighborhood, and the sum total of their value amounted to 2,200,000 dinars, which was paid out of the overflowing revenues of the estates and endowments belonging to the Hindu temples, and from the tax upon courtesans attached to them, and no charge was incurred by the public treasury. It is a strange thing that when those horses arrive there, instead of giving them raw barley they give them roasted barley and grain dressed with butter, and boiled cow's milk to drink.…

They bind them for forty days in a stable with ropes and pegs, in order that they may get fat; and afterwards, without taking measures for training, and without stirrups and other appurtenances of riding, the Indian soldiers ride upon them like demons.

They are equal to Burak in celerity, and are employed either in war or exercise. In a short time the most strong, swift, fresh, and active horses become weak, slow, useless, and stupid. In short, they all become wretched and good for nothing. In this climate these powerful horses which fly swiftly without a whip (for whips are required for horses, especially if they are to go any distance), should they happen to cover, become exceedingly weak and altogether worn out and unfit for riding. There is, therefore, a constant necessity of getting new horses annually, and, consequently, the merchants of Muhammadan countries bring them to Ma'bar, Their loss is not without its attendant advantage, for it is a providential ordinance of God that the western should continue in want of eastern products, and the eastern world of western products, and that the north should with labour procure the goods of the south, and the south be furnished in like manner with commodities brought in ships from the north. Consequently, the means of easy communication are always kept up between these different quarters, as the social nature of human beings necessarily requires and profits by…

Extent of wealth

In the months of the year 692 H. the above-mentioned Dewar, the ruler of Ma'bar, died, and left behind him much wealth and treasure. It is related by Maliku-l Islam Jamalu-d din, that out of that treasure 7,000 oxen, laden

with precious stones, and pure gold and silver, fell to the share of the brother who succeeded him. Malik-i a'zam Takiu-d din continued prime minister as before, and, in fact, ruler of that kingdom, and his glory and magnificence were raised a thousand times higher.

Notwithstanding the immense wealth acquired by trade, he gave orders that whatever commodities and goods were imported from the remotest parts of China and Hind into Ma'bar, his agents and factors should be allowed the first selection, until which no one else was allowed to purchase. When he had selected his goods he dispatched them on his own ships, or delivered them to merchants and ship owners to carry to the island of Kais. There also it was not permitted to any merchant to contract a bargain until the factors of Maliku-l Islam had selected what they required, and after that the merchants were allowed to buy whatever was suited to the wants of Ma'bar. The remnants were exported on ships and beasts of burden to the isles of the sea, and the countries of the east and west, and with the prices obtained by their sale such goods were purchased as were suitable for the home market; and the trade was so managed that the produce of the remotest China was consumed in the farthest west. No one has seen the like of it in the world…

P. The kings of India the Greater

1. Distinct from others, Friar Jordanus[44]

…the kings have this distinction from others, that they wear upon their arms gold and silver rings, and on the neck a gold collar with a great abundance of gems.

Succession in India the Greater

In this India never do (even) the legitimate sons of great kings, or princes, or barons, inherit the goods of their parents, but only the sons of their sisters; for they say that they have no surety that those are their own sons, because wives and mistresses may conceive and generate by some one else; but 'tis not so with the sister, for whatever man may be the father they are certain that the offspring is from the womb of their sister, and is consequently thus truly of their blood.

2. Many idolatrous kings in India the Greater, Friar Jordanus[45]

In this Greater India are twelve idolatrous kings, and more. For there is one very powerful king in the country where pepper grows, and his kingdom is called Molebar. There is also the king of Singuyli and the king of Columbum, the king of which is called Lingua, but his kingdom Mohebar. There is also the king of Molephatam, whose kingdom is called Molepoor, where pearls are taken in infinite quantities. There is also another king in the island of Sylen, where are found precious stones and good elephants. There be also three or four kings on the island of Java, where the good spices grow. There be also other kings, as the king of Telenc, who is very potent and great. The kingdom of Telenc abounds in corn, rice, sugar, wax, honey and honeycomb, pulse, eggs, goats, buffalos, beeves, milk, butter, and in oils of divers kinds and in many excellent fruits, more than any other part of the Indies. There is also the kingdom of Maratha which is very great; and there is the king of Batigala, but he is of the Saracens. There be also many kings in Chopa.

What shall I say? The greatness of this India is beyond description. But let this much suffice concerning India the Greater and the Less.

Q. The Zamorin

1. Samuri [*Samudri*, Sea King, Zamorin according to the Portuguese], Ibn Batutta[46]

The sultan of Calicut is an infidel, known is 'the Samari.' He is an aged man and shaves his beard, as some of the Greeks do. In this town too lives the famous shipowner Mithqal, who possesses vast wealth and many ships for his trade with India, China, Yemen, and Fars. When we reached the city, the principal inhabitants and merchants and the sultan's representative came out to welcome us, with drums, trumpets, bugles and standards on their ships. We entered the harbour in great pomp, the like of which I have never seen in those lands, but it was a joy to be followed by distress.

2. The Zamorin, Abder Razzak[47]

The sovereign of this city bears the title of *Sameri* [the Zamorin]. When he dies it is his sister's son who succeeds him, and his inheritance does not belong to his son, or his brother, or any other of his relations. No one reaches the throne by means of the strong hand…

When I obtained my audience of this prince, the hall was filled with two or three thousand Hindus, who wore the costume above described; the principal personages amongst the Mussulmauns were also present. After they had made me take a seat, the letter of his majesty, the happy Khakan [Mirza Shah Rukh], was read, and they caused to pass in procession before the throne, the horse, the pelisse, the garment of cloth of gold, and the cap to be worn at the ceremony of Nauruz. The *Sameri* showed me but little consideration…

On a sudden a man arrived, who brought me the intelligence that the king of Bidjanagar [Vijayanagar], who holds a powerful empire and a mighty dominion under his sway, had sent to the *Sameri* a delegate charged with a letter, in which he desired that he would send on to him the ambassador of his majesty, the happy Khakan [Mirza Shah Rukh]. Although the *Sameri* is not subject to the laws of the king of Bidjanagar, he nevertheless pays him respect, and stands extremely in fear of him; since, if what is said is true, this latter prince has in his dominions three hundred ports, each of which is equal to Calicut, and on *terra firma* his territories comprise a space of three months' journey. The coast, which includes Calicut with some other neighbouring ports, and which extends as far as Kabel, a place situated opposite the Island of Serendib, otherwise called Ceylon, bears the general name of Melibar. From Calicut are vessels continually sailing for Mecca, which are for the most part laden with pepper. The inhabitants of Calicut are adventurous sailors: they are known by the name of Tchini-betchegan (son of the Chinese), and pirates do not dare to attack the vessels of Calicut…

R. King of Vijayanagar

1. Powerful ruler, Abder Razzak[48]

…we arrived at the city of Bidjanagar. The king sent a numerous cortege to meet us, and appointed us a very handsome house for our residence.

The preceding details, forming a close narrative of events, have shown to readers and writers that the chances of a maritime voyage had led Abd-er-Razzak, the author of this work, to the city of Bidjanagar. He saw a place extremely large and thickly peopled; and a king possessing greatness and sovereignty to the highest degree, whose dominion extends from the

frontier of Serendib to the extremities of the country of Kalbergah. From the frontiers of Bengal to the environs of Belinar (Melibar), the distance is more than a thousand parasangs. The country is for the most part well cultivated, very fertile, and contains about three hundred harbours. One sees there more than a thousand elephants, in their size resembling mountains, and in their forms resembling devils. The troops amount in number to eleven lak (1,100,00).

One might seek in vain throughout the whole of Hindoostan to find a more absolute *rai* (king); for the monarchs of this country bear the title of *rai.* Next to him the Brahmins hold a rank superior to that of all other men. The book of Kalilah and Dimna, the most beautiful work existing in the Persian language, and which presents us with the stories of a *rai* and a Brahmin, is probably a production of the talent of the literati of this country.

2. Audience with king, Abder Razzak[49]

The author of this narrative, having arrived in this city at the end of the month of *Zou'lhidjah* [the end of April 1443] took up his abode in an extremely lofty house, which had been assigned to him…. One day some messengers sent from the palace of the king came to seek me, and at the close of that same day I presented myself at court, and offered for the monarch's acceptance five beautiful horses, and some *tokouz* of damask and satin. The prince was seated in a hall, surrounded by the most imposing attributes of state. Right and left of him stood a numerous crowd of men ranged in a circle. The king was dressed in a robe of green satin, around his neck he wore a collar, composed of pearls of beautiful water and other splendid gems. He had an olive complexion, his frame was thin, and he was rather tall; on his cheeks might be seen a slight down, but there was no beard on his chin. The expression of his countenance was extremely pleasing. On being led into the presence of this prince I bowed my head three times. The monarch received me with interest, and made me take a seat very near him. When he took the august letter of the emperor, he handed it to the interpreter and said: "My heart is truly delighted to see that a great king has been pleased to send me an ambassador."

As the humble author of this narrative, in consequence of the heat, and the great number of robes in which he was dressed, was drowned in perspiration, the monarch took pity upon him, and sent him a fan, similar to

the khata which he held in his hand. After this a salver was brought, and they presented to the humble author two packets of betel, a purse containing five hundred *fanoms,* and twenty *mithkals* of camphor. Then, receiving permission to depart he returned to his house. Hitherto his provisions had been brought him daily, consisting of two sheep, four pair of fowls, five *man* of rice, one of butter, one of sugar, and two *varahahs* of gold; and they continued supplying him regularly with the same articles. Twice in the week, at the close of day, the king sent for him, and put questions to him respecting his majesty, the happy Khakan. On each occasion the author received a packet of betel, a purse of *fanoms,* and some *mithkal* of camphor.

The king said to him by his interpreter: "Your monarchs invite an ambassador, and receive him to their table; as you and we may not eat together, this purse full of gold is the feast we give to an ambassador."…

3. Royal entourage at Vijayanagar, Nicolo Conti[50]

Their king is more powerful than all the other kings of India. He takes to himself twelve thousand wives, of whom four thousand follow him on foot wherever he may go, and are employed solely in the service of the kitchen. A like number, more handsomely equipped, ride on horseback. The remainder are carried by men in litters, of whom two thousand or three thousand are selected as his wives on condition that at his death they should voluntarily burn themselves with him, which is considered to be a great honour for them.

4. Weapons at Vijayanagar, Nicolo Conti[51]

The natives of this part of India, when engaged in war, use javelins, swords, arm-pieces, round shields, and also bows. The inhabitants of the other parts of India wear also the helmet and corslet. The natives of central India make use of balistae, and those machines which we call bombardas, also other warlike implements adapted for besieging cities. They call us Franks, and say: "While they call other nations blind, that they themselves have two eyes and that we have but one, because they consider that they excel all others in prudence."

S. The King of Cochin

The king of Ko-Chih [Cochin], Ma Huan[52]

The king or ruler is of the solar race, and is a sincere believer in Buddhism [Ma Huan does not distinguish between Hinduism and Buddhism], and has the greatest reverence for elephants and oxen; and every morning at daylight prostrates himself before an image of Buddha. The king wears no clothing on the upper part of his person; he has simply a square of silk wound round his loins, kept in place by a coloured waistband of he same material, and on his head a turban of yellow or white cotton cloth. The dress of the officers and the rich differs but little from that of the king.

T. The king of Calicut

1. King of Nair caste, Ma Huan[53]

The king belongs to the Nair class, and, like his brother of Cochin, is a sincere follower of Buddha, and as such does not eat beef; his overseer, being a Muhammadan, does not eat pork. This led, it is said in times past, to a compact being made between the king and his overseer, to the effect that if the king would give up eating pork the overseer would give up eating beef. This compact has been most scrupulously observed by the successors of both parties up to the present day.

The king at his devotions prostrates himself before an image of Buddha every morning; which being over, his attendants collect all the cow-dung about the place, and smear it over the image of the god. Some of the dung the king orders to be burnt to ashes and put into a small cotton bag, which he continually wears upon his person; and when his morning ablutions are over, he mixes some of the powdered dung with water and smears it over his forehead and limbs; by so doing he considers he is showing Buddha the greatest reverence.

Muhammadan subjects

Many of the King's subjects are Muhammadans, and there are twenty or thirty mosques in the kingdom to which the people resort every seventh day for worship. On this day, during the morning, the people being at the mosque, no business whatever is transacted; and in the after part of the day, the services being over, business is resumed…

Succession at Calicut

The succession to the throne is settled in a somewhat curious manner. The king is not succeeded by his son, but by his sister's son, because his nephew, being born of his sister's body is considered nearer to him by blood. If the king has no sister the succession goes to his brother; if he has no brother it goes to a man of ability and worth. Such has been the rule for many generations.

2. Vasco da Gama's audience with the king[54]

[A *Royal Audience, May* 28.] The king was in a small court, reclining upon a couch covered with a cloth of green velvet, above which was a good mattress, and upon this again a sheet of cotton stuff, very white and fine, more so than any linen. The cushions were after the same fashion. In his left hand the king held a very large golden cup [spittoon], having a capacity of half an almude [8 pints]. At its mouth this cup was two palmas [16 inches] wide, and apparently it was massive. Into this cup the king threw the husks of a certain herb which is chewed by the people of this country because of its soothing effects, and which they call *atambor* [a corruption of the Arabic *tambur*, betel-nut]. On the right side of the king stood a basin of gold, so large that a man might just encircle it with his arms: this contained the herbs. There were likewise many silver jugs. The canopy above the couch was all gilt.

The captain, on entering, saluted in the manner of the country: by putting the hands together, then raising them towards Heaven, as is done by Christians when addressing God, and immediately afterwards opening them and shutting the fists quickly. The king beckoned to the captain with his right hand to come nearer, but the captain did not approach him, for it is the custom of the country for no man to approach the king except only the servant who hands him the herbs, and when anyone addresses the king he holds his hand before the mouth, and remains at a distance. When the king beckoned to the captain he looked at us others, and ordered us to be seated on a stone bench near him, where he could see us. He ordered that water for our hands should be given us, as also some fruit, one kind of which resembled a melon, except that its outside was rough and the inside sweet, whilst another kind of fruit resembled a fig, and tasted very nice [the fruits were the jack and bananas]. There were men who prepared these fruits for

us; and the king looked at us eating, and smiled; and talked to the servant who stood near him supplying him with the herbs referred to.

Then, throwing his eyes on the captain, who sat facing him, he invited him to address himself to the courtiers present, saying they were men of much distinction, that he could tell them whatever he desired to say, and they would repeat it to him (the king). The captain-major replied that he was the ambassador of the King of Portugal, and the bearer of a message which he could only deliver to him personally. The king said this was good, and immediately asked him to be conducted to a chamber. When the captain-major had entered, the king, too, rose and joined him, whilst we remained where we were. All this happened about sunset. An old man who was in the court took away the couch as soon as the king rose, but allowed the plate to remain. The king, when he joined the captain, threw himself upon another couch, covered with various stuffs embroidered in gold, and asked the captain what he wanted.

And the captain told him he was the ambassador of a King of Portugal, who was Lord of many countries and the possessor of great wealth of every description, exceeding that of any king of these parts; that for a period of sixty years his ancestors had annually sent out vessels to make discoveries in the direction of India, as they knew that there were Christian kings there like themselves. This, he said, was the reason which induced them to order this country to be discovered, not because they sought for gold or silver, for of this they had such abundance that they needed not what was to be found in this country. He further stated that the captains sent out travelled for a year or two, until their provisions were exhausted, and then returned to Portugal, without having succeeded in making the desired discovery. There reigned a king now whose name was Dom Manuel, who had ordered him to build three vessels, of which he had been appointed captain-major, and who had ordered him not to return to Portugal until he should have discovered this King of the Christians, on pain of having his head cut off. That two letters had been intrusted to him to be presented in case he succeeded in discovering him, and that he would do so on the ensuing day; and, finally, he had been instructed to say by word of mouth that he [the King of Portugal] desired to be his friend and brother.

In reply to this the king said that he was welcome; that, on his part, he held him as a friend and brother, and would send ambassadors with him to

Portugal. This latter had been asked as a favour, the captain pretending that he would not dare to present himself before his king and master unless he was able to present, at the same time, some men of this country.

These and many other things passed between the two in this chamber, and as it was already late in the night, the king asked the captain with whom he desired to lodge, with Christians or with Moors? And the captain replied, neither with Christians nor with Moors, and begged as a favour that he be given a lodging by himself. The king said he would order it thus, upon which the captain took leave of the king and came to where we were, that is, to a veranda lit up by a huge candlestick. By that time four hours of the night had already gone…

[Presents for the King.] On Tuesday [May 29] the captain got ready the following things to be sent to the king, viz., twelve pieces of *lambel* [striped cloth], four scarlet hoods, six hats, four strings of coral, a case containing six wash-hand basins, a case of sugar, two casks of oil, and two of honey. And as it is the custom not to send anything to the king without the knowledge of the Moor, his factor, and of the *bale* [governor], the captain informed them of his intention. They came, and when they saw the present they laughed at it, saying that it was not a thing to offer to a king, that the poorest merchant from Mecca, or any other part of India, gave more, and that if he wanted to make a present it should be in gold, as the king would not accept such things. When the captain heard this he grew sad, and said that he had brought no gold, that, moreover, he was no merchant, but an ambassador; that he gave of that which he had, which was his own [private gift] and not the king's; that if the King of Portugal ordered him to return he would intrust him with far richer presents; and that if King Camolim [Zamorin, a corruption of Samudriya Raja, king of the coast] would not accept these things he would send them back to the ships. Upon this they declared that they would not forward his presents, nor consent to his forwarding them himself. When they had gone there came certain Moorish merchants, and they all depreciated the present which the captain desired to be sent to the king.

When the captain saw that they were determined not to forward his present, he said, that as they would not allow him to send his present to the palace he would go to speak to the king, and would then return to the ships. They approved of this, and told him that if he would wait a short time they

would return and accompany him to the palace. And the captain waited all day, but they never came back. The captain was very wroth at being among so phlegmatic and unreliable a people, and intended, at first, to go to the palace without them. On further consideration, however, he thought it best to wait until the following day. As to us others, we diverted ourselves, singing and dancing to the sound of trumpets, and enjoyed ourselves much.

[A Second Audience, May 30.] On Wednesday morning the Moors returned, and took the captain to the palace, and us others with him. The palace was crowded with armed men. Our captain was kept waiting with his conductors for fully four long hours, outside a door, which was only opened when the king sent word to admit him, attended by two men only, whom he might select. The captain said that he desired to have Fernao Martins with him, who could interpret, and his secretary. It seemed to him, as it did to us, that this separation portended no good.

When he had entered, the king said that he had expected him on Tuesday. The captain said that the long road had tired him, and that for this reason he had not come to see him. The king then said that he had told him that he came from a very rich kingdom, and yet had brought him nothing; that he had also told him that he was the bearer of a letter, which had not yet been delivered. To this the captain rejoined that he had brought nothing, because the object of his voyage was merely to make discoveries, but that when other ships came he would then see what they brought him; as to the letter, it was true that he had brought one, and would deliver it immediately.

The king then asked what it was he had come to discover: stones or men? If he came to discover men, as he said, why had he brought nothing? Moreover, he had been told that he carried with him the golden image of a Santa Maria. The captain said that the Santa Maria was not of gold, and that even if she were he would not part with her, as she had guided him across the ocean, and would guide him back to his own country. The king then asked for the letter. The captain said that he begged as a favour, that as the Moors wished him ill and might misinterpret him, a Christian able to speak Arabic should be sent for. The king said this was well, and at once sent for a young man, of small stature, whose name was Quaram. The captain then said that he had two letters, one written in his own language and the other in that of the Moors; that he was able to read the former, and knew that it contained nothing but what would prove acceptable; but that as to the other

he was unable to read it, and it might be good, or contain something that was erroneous. As the Christian was unable to read Moorish, four Moors took the letter and read it between them, after which they translated it to the king, who was well satisfied with its contents.

The king then asked what kind of merchandise was to be found in his country. The captain said there was much corn, cloth, iron, bronze, and many other things. The king asked whether he had any merchandise with him. The captain replied that he had a little of each sort, as samples, and that if permitted to return to the ships he would order it to be landed, and that meantime four or five men would remain at the lodgings assigned them. The king said no! He might take all his people with him, securely moor his ships, land his merchandise, and sell it to the best advantage. Having taken leave of the king the captain returned to his lodgings, and we with him. As it was already late no attempt was made to depart that night.

3. The 16th century author, Fernao Lopes de Castanheda, in his *Historia do Descobrimento e Conquista da India pelos Portugueses,* based on the near contemporary account *Relation* attributed to Alvaro Velho[55]

[Gama convinced he was before an image of Virgin] went down on his knees, and the others along with him, and they said their prayers. ..And Joao de Saa who had his doubts about whether that was really a Christian church, on seeing the ugliness of the images that were on the walls, said while going down on his knees: If this is the Devil, I worship the true God. And Vasco da Gama who heard him, looked at him smiling.

❑

CHAPTER — 10

Parsees, Jews, Christians

A. Parsees
B. Jews
C. The legend of Prester John
D. The St. Thomas tradition

A. Parsees

Parsees in India, Friar Jordanus[1]

There be also other pagan-folk in this India who worship fire; they bury not their dead, neither do they burn them, but cast them into the midst of a certain roofless tower, and there expose them totally uncovered to the fowls of heaven. These believe in two First Principles, to wit, of Evil and of Good, of Darkness and of Light, matters which at present I do not purpose to discuss.

B. Jews

Jews, the Spanish Jew, Benjamin of Tudela[2]

All the cities and countries inhabited by these people contain only about one hundred Jews, who are of black colour as well as the other inhabitants. The Jews are good men, observers of the law, and possess the Pentateuch, the Prophets, and some little knowledge of the Thalmud and its decisions.

C. The legend of Prester John

1. Otto von Freising writing around 1145 A.D. in the first reference to the Indian priest-king[3]

A certain John, who lives beyond Persia and Armenia in the Far East, is Christian along with his people.

2. Emperor Sigismund, at the close of the Middle Ages, on the issue of the priest-king[4]

…a priest is Emperor in India, where none can become Emperor unless he is a priest.

3. Friar Odoric, the last medieval traveller to place Prester John in Asia[5]

…as regards [the Prester] not one hundredth part is true of what is told of him.

4. The missionary, Francesco Alvarez, described the orders by King John to Pedro Covilham and Alfonso de Payva to find the country of Prester John[6]

When Peter de Covillan was returned, the king John called him and told him secretly, that having always knowne him loyal and his faithfull servant, and readie to doe his majestie good service; seeing he understood the Arabic tongue; he purposed to send him with another companion to discover and learne where Prete Janni dwelt, and whether his territories reached into the sea; and where the pepper and cinnamon grew, and other sorts of spicerie which were brought unto the citie of Venice from the countries of the Moores…And so in the year 1487, the 7th of May, they were both dispatched…

D. The St. Thomas tradition

1. Isidore of Seville on St. Thomas [c. 638 A.D.][7]

This Thomas preached the Gospel of Christ to the Parthians, the Medes, the Persians, the Hyrcanians and the Bactrians, and to the Indians of the Oriental region and penetrating the innermost regions and sealing his preaching by his passion he died transfixed with a lance at Calamina, a city of India, and there was buried with honour…

2. *The Anglo-Saxon Chronicle* on the tradition of St. Thomas and St. Bartholomew's apostolate in India [A.D. 883][8]

This year went the army up the Scheldt to Conde, and there sat a year. And Pope Marinus sent King Alfred the *Lignum domni.* The same year led Sighelm and Athelstan to Rome the alms which King Alfred ordered thither, and also in India to St. Thomas and to St. Bartholomew. Then they sat against the army at London; and there, with favour of God, they were very successful after the performances of their vows.

3. William of Malmesbury on the St. Thomas Tradition [A.D. 1114-1123][9]

Ever intent on almsgiving, he confirmed the privileges of the churches as appointed by his father and sent many presents overseas to Rome and St. Thomas in India. Sighelm, Bishop of Sherborne sent an ambassador for this purpose, who penetrated successfully into India…Returning thence, he brought back many brilliant exotic gems and aromatic juices in which that country abounds.

4. Saint Thomas, Marco Polo[10]

In this province of Maabar is the body of the glorious martyr, Saint Thomas the Apostle, who there suffered martyrdom. It rests in a small city, not frequented by many merchants, because unsuited to the purposes of their commerce; but, from devout motives, a vast number both of Christians and Saracens resort thither. The latter regard him as a great prophet, and name him Ananias, signifying a holy personage. The Christians who perform this pilgrimage collect earth from the spot where he was slain, which is of a red colour, and reverentially carry it away with them; often employing it afterwards in the performance of miracles, and giving it, when diluted with water, to the sick, by which many disorders are cured.

5. The kingdom of Mobar, where lieth the body of St. Thomas, Odoric of Pordenone[11]

From this realm is a journey of ten days to another realm which is called Mobar [the Arabic name Ma'abar, the passage or ferry, was probably a corruption of Marawar, the name of the Hindu state which adjoined Adam's Bridge] and this is very great, and hath under it many cities and towns. And in this realm is laid the body of the Blessed Thomas the Apostle. His church is filled with idols, and beside it are some fifteen houses of the Nestorians, that is to say Christians, but vile and pestilent heretics.

6. St. Thomas at Malabar, Nicolo Conti[12]

Proceeding onwards the said Nicolo arrived at a maritime city which is named Malepur, situated in the Second Gulf beyond the Indus [the Bay of Bengal]. Here the body of Saint Thomas lies honourably buried in a very large and beautiful church: it is worshipped by heretics, who are called Nestorians, and inhabit this city to the number of a thousand. These Nestorians are scattered over all India, in like manner as are the Jews among us. All this province is called Malabar.

CHAPTER — 11

Muslim Invaders

A. Early expeditions unsuccessful
B. Conquest of Multan and Sindh
C. Subuktigin's invasions
D. Some conquests of Mahmud of Ghazni
E. Tilak the Hindu
F. Ahmad Nialtigin at Banaras
G. Muhammad Ghori
H. Bhaktiyar Khalji
I. Timur

Note. An Arab pillaging expedition visited Thana [near Bombay] as early as A.D. 637, during the reign of the second Caliph, Omar. More raids followed on the Indian coast. As part of a forward policy, the Umayyad governor of Iraq, al-Hajjaj [694-714], sent his nephew and son-in-law, Muhammad bin Qasim, a young lad of seventeen, to annex the region from Sindh to Transoxiana. Sindh was then ruled by Raja Dahir, son the Brahmin, Chach.

Qasim first laid siege to Dabul, an inland commercial port near modern Karachi. Dahir's garrison offered stiff resistance, but, faced with heavy bombardment, was forced to capitulate. Dahir's sister rallied the women, who, to save themselves from dishonour, set their house ablaze and perished in the flames. Another battle was fought at Brahmanabad in June 712, in which Dahir was killed. This opened the way to Multan, the chief city of the upper Indus which was captured after a siege. The Arab invasion was not followed by a further thrust into the subcontinent for the Arabs had attacked from the wrong quarter. The great Thar Desert blocked Islamic expansion into the subcontinent.

It was only several centuries later, under the Turks, that Islamic power advanced in the subcontinent. In A.D. 962, Alptagin, a Turk who began his career as a military slave, established himself as Governor of Ghazni, in Afghanistan. His son-in-law and successor, Subuktigin, annexed large parts of Afghanistan and became the first of the Ghaznavid Turkic rulers of Afghanistan. He was also the first Muslim to attempt the invasion of India

from the north-west. His adversary was the Hindu Shahi ruler, Jaipal, whose territory extended from Lamghan to the river Chenab and from the hills of southern Kashmir to the frontier kingdom of Multan. Subuktigin engaged in several military encounters with Jaipal in the Kabul valley, but could not subdue him. Nonetheless, he had shown the way to Hindustan.

The major expansion of the Islamic realm began with his son, Mahmud Ghaznavi, who, between A.D. 1000 and 1026, led no less than sixteen campaigns to India. Mahmud first attacked the frontier towns of the Khaibar pass. Jaipal endeavoured in vain to save Peshawar. He, along with fifteen of his relatives, was brought as captive before the conqueror. Their costly necklaces were torn off and immense booty taken. Jaipal was released from captivity, but, unable to bear the disgrace, cast himself upon a funeral pyre.

In his campaign of A.D. 1008, Mahmud found ranged against him the rajas of Punjab supported by allies from other parts of India. They were led by Jaipal's son, Anandpal. Mahmud had never encountered such an army. A lucky accident tilted the scales in his favour in the battle of Waihind.

In subsequent years, Mahmud kept up his attack. Kangra [Nagarkot], Mathura, Kanauj, Gwalior, Kalinjar, and, in A.D. 1025-26, the famous temple of Somnath bore the brunt of his fervour. His victory at Somnath made him a hero in the Islamic world.

The kingdom Mahmud founded survived for a century and a half after his death, but diminished every decade. The Ghaznavids retained their hold over a small region around Lahore, Punjab being the only part of India they had annexed.

There was a considerable interval before the next series of invasions commenced with Muhammad Ghori [1173-1206] in the late twelfth century. The Ghurids, unlike the Ghaznavids, desired annexation of territory. Their two most formidable adversaries were Prithviraj Chauhan of Ajmer and Jayachand Gahadvala of Kanauj. Muhammad Ghori himself led the campaigns against the two rulers. He was badly wounded in 1191 in the battle at Tarain against Prithviraj Chauhan. Never had the armies of Islam been so worsted in the subcontinent. Muhammad Ghori, however, returned the following year, and his success at the second battle of Tarain marked the beginning of Turkic rule in India. This was followed in 1194, with his victory over Jayachand Gahadvala in the battle of Chandawar.

Several other campaigns were led by his Turkish slave, Qutubuddin Aibak, while a military adventurer, Bakhtiyar Khalji attacked Bihar as far as the Buddhist university of Odantapuri, where he slaughtered the monks and seized the town. In 1204-1205, he attacked Nadia, one of the capitals of the Bengal ruler, Lakshmansena. His forays in the Assam region ended in disaster. In 1206 the Delhi Sultanate was established.

A. Early Expeditions unsuccessful

Expedition to Thana, Al Biladhuri[1]

Ali, son of Muhammad, son of Abdullah, son of Abu Saif, has related that the Khalif ‘Umar, son of Al Khattab appointed Usman, son of Abu-l Asi of the tribe of Sakif to Bahrain and Uman in the year 15 H. (636 A.D.) Usman sent his brother Hakam to Bahrain, and he himself went to Uman, and despatched an army to Tana [Thana]. When the army returned he wrote to the Khalif Umar to inform him of it. Umar wrote in, reply: “O brother of Sakif, thou has placed the worm in the wood but I swear by the God, that if our men had been killed I would taken (slain) an equal number from your tribe.” Hakam dispatched a force to Barauz [Broach]; he also sent to the bay of Debal his brother Mughira, who met and defeated the enemy.

When ‘Usman, son of Akkan become Khalif, he appointed Abdullah, son of Amar, son of Kuraiz to [the government of] Irak and wrote to him an order to send a person to the confines of Hind in order to acquire knowledge and bring back information. He accordingly deputed Hakim, son of Jaballa al ‘Abdi. When this men returned he was sent on to the Khalif, who questioned him about the state of those regions. He replied that he knew them because he had examined them. The Khalif then told him to describe them. He said, “Water is scarce, the fruits are poor, and the robbers are bold; if few troops are sent there they will be slain, if many, they will starve.” Usman asked him whether he spoke accurately or hyperbolically. He said that he spoke according to his knowledge. The Khalif abstained from sending any expedition there.

At the end of the year 38, or the beginning of the year 39 H. (659 A.D.) in the Khalifat of Ali, son of Abu Salib, Haras, the son of Marra-I Abdi went with the sanction of the Khalif to the same frontier, as a volunteer. He was victorious, got plunder, made captives, and distributed in one day a

thousand heads. He and those who were with him, saving a few, were slain in the land of Kikan in the year 42 H. (662 A.D.) Kikan is in Sind near the frontiers of Khurasan.

In the year 44 H. (664. A.D.), and in the days of the Khalif Mu'awiya, Muhallab, son of Abu Safra made war upon the same frontier, and advanced as far as Banna and Alahwar, which lie between Multan and Kabul. The enemy opposed him and killed him and his followers. In the land of Kikan, Muhallab encountered eighteen Turki horsemen, riding crop-tailed horses. They fought well but were all slain. Muhallab said, "How much more active than we those barbarians were." So he docked the tails of his horses, and was the first among the Musulmans who did so.

In the reign of Mu'awiya, son of Abu Sufain, the Amir Abdullah, son of Amir, or according to some, Mu'awiya himself sent Abdullah, son of Suar al 'Abdi, to the frontier of Hind. He fought in Kikan and captured booty. Then he came to Mu'awiya and presented to him some Kikan horses…

In the reign of the same Mu'awiya, the Chief Ziyad, son of Abu Sufian, appointed Sinan, son of Salama, son of al Muhabbik the Huzaili (to the command). He was a good, and godly man, and the first who made his troops take an oath of divorce. He proceeded to the frontier and having subdued Makran and its cities by force, he staid there, and established his power in the country. According to Ibn al Kalbi, it was Hakim bin Jabala al 'Abdi who conquered Makran.

Ziyad then appointed Rashid son of Umru-l Judaidi of the tribe of Azd to the frontier. He proceeded to Makran and was victorious in warring against Kikan; but he was slain fighting against the Meds. Sinan, son of Salama, then succeeded to the command and was confirmed therein by Ziyad. He remained there two years.

'Abbad, son of Ziyad, then made war on the frontier of Hind by way of Sijistan. He went to Sanaruz, from whence he proceeded by way of Khaz to Ruzbar in Sijistan on the banks of the Hind-mand. Then he descended to Kish, and crossing the desert came to Kandahar. He fought the inhabitants, routed them, put them to flight and subdued the country; but many Musulmans perished. 'Abbad observed the high caps of the people of that country, and had some made like them, which he called Abbadiya.

Ziyad next appointed Al Manzar, son of Al Jarud al Abdi, to the frontiers of India. He was known by the name of Abu-l Ash'as. He attacked and

conquered Nukan and Kikan. The Musulmans obtained great plunder, and their forces spread over all the country. He captured Kusdar and took prisoners there. Sinan had previously taken it, but its inhabitants had been guilty of defection. He died there (in Kuzdar).

The governor Ubaidullah, son of Ziyad, then appointed Ibn Harri al Bahali. God, by his hands, subdued these countries, for he waged fierce war on them and conquered and plundered them. Some writers say that it was Sinan, son of Salama, who was appointed to the (chief) command by Ubaidullah and that Harri led the forces.

The people of Nukan are now Muhammadans. Amran, son of Musa, son of Yahya, son of Khalid the Barmakide, built a city there in the Khalifat of M'utasim bi-llah which he called Al Baiza (the white). When al Hajjaj, son of Yusuf, son of al Hakim, son of Abu 'Akail al Sakifi, was governor of Irak, Said, son of Aslam, son of Zura'a al Kalabi was appointed to Makran and its frontiers. He was opposed and slain there by Mu'awiya and Muhammad, sons of al Haras al 'Alafi.

Hajjaj then appointed Mujja', son of S'ir al Tamimi to the frontier. He made war upon, plundered and defeated the tribes about Kanda-bil, and this conquest was subsequently completed by Muhammad, son of al Kasim. Mujja' died in Makran after being there a year.

After the death of Mujja', Hajjaj appointed in his place Muhammad, son of Harun, son of Zara al Namari. Under the government of Muhammad, the king of the Isle of Rubies [Ceylon] sent as a present to Hajjaj, certain Muhammadan girls who had been born in his country, the orphan daughters of merchants who had died there. The king hoped by this measure to ingratiate himself with Hajjaj; but the ship in which he had embarked these girls was attacked and taken by some barks *(bawarij)* belonging to the Meds of Debal. One of the women of the tribe of Yarbu exclaimed, 'Oh Hajjaj!' When this news reached Hajjaj, he replied, 'I am here.' He then sent an ambassador to Dahir to demand their release, but Dahir replied, "They are pirates who have captured these women, and over them I have no authority." Then Hajjaj sent Ubaidullah, son of Nabhan, against Debal. Ubaidullah being killed, Hajjaj wrote to Budail, son of Tahfa, of the tribe of Bajali, who was at 'Uman, directing him to proceed to Debal. When he arrived there his horse took fright (and threw him), and the enemy

surrounded him and killed him. Some authors say he was killed by the Jats of Budha…

Afterwards, Hajjaj, during the Khilafat of Walid, son of ‘Abdul malik appointed Muhammad, son of Kasim, son of Muhammail, son of Hakim, son of Abu ‘Ukail to command on the Sindian frontier. Muhammad was in Fars when the order arrived, and had previously received instructions to go to Rai [south of the Caspian Sea]. Abu-l Aswad Jahm, son of Zahru-l Ju’fi, was at the head of the advanced guard, and he was ordered to return to Muhammad, and he joined him on the orders of Sind. Hajjaj ordered six thousand Syrian warriors to attend Muhammad, and others besides. He was provided with all he could require, without omitting even thread and needles. He had leave to remain at Shiraz until all the men who were to accompany him had assembled, and all the preparations had been duly made. Hajjaj had some dressed cotton saturated with strong vinegar, and then dried it in the shade, and said, “When you arrive in Sind, if you find the vinegar scarce, soak the cotton in water, and with the water you can cook your food and season your dishes as you wish.” Some authors say, that when Muhammad arrived on the frontiers, he wrote to complain of the scarcity of vinegar, and this was the reason which induced Hajjaj to send cotton soaked in vinegar.

Then Muhammad, son of Kasim went to Makran, and remained there some time. He then went to Kannazbur and took it, and then to Armail, which he also took. Muhammad, son of Harun, son of Zara, went to meet him, and joined him, but he died near Armail at Kasim’s side, and was buried at Kambal [Kambali?].

B. Conquest of Multan and Sindh, Al- Biladuri[2]

Muhammad, son of Kasim, left Armial, accompanied by Jahm, the son of Zahru-l Ju’fi, and arrived at Debal on Friday, where ships brought to him a supply to men, arms, and warlike machines. He dug an entrenchment which he defended with spearmen, and unfurled his standards; each body of warriors was arrayed under its own banner, and he fixed the manjanik, which was called ‘the bride,’ and required five hundred men to work it. There was at Debal a lofty temple, (*budd*) surmounted by a long pole, and on the pole was fixed a red flag, which when the breeze blew was unfurled

over the city. The budd is a high steeple, below which the idol, or idols, are deposited as in this instance. The Indians give in general the name of budd to anything connected with their worship or which forms the object of their veneration. So an idol is called budd.

In the correspondence which ensued, Muhammad informed Hajjaj of what he had done, and solicited advice respecting the future. Letters were written every three days. One day a reply was received to this effect:—"Fix the manjanik and shorten its foot, and place it on the east; you will then call the manjanik-master, and tell him to aim at the flag staff, of which you have given a description." So he brought down the flagstaff, and it was broken; at which the infidels were sore afflicted. The idolaters advanced to the combat, but were, put to flight; ladders were then brought and the Musulmans escaladed the wall. The first who gained the summit was a man of Kufa, of the tribe of Murad. The town was thus taken by assault, and the carnage endured for three days. The governor of the town, appointed by Dahir fled, and the priests of the temple were massacred. Muhammad marked out a place for the Musulmans to dwell in, build a mosque, and left four thousand Musulmans to garrison the place.

Muhammad, son of Yahya, says that Mansur, the son of Hatim, the grammarian, a freeman of the family of Khalid, son of Assaid, relates that he had seen the pole broken into fragments which had been placed on the steeple of the temple. 'Amibissa, son of Ishak Az Zabbi, the governor of Sind, in the Khalifat of Mu'tasim billah, knocked down the upper part of the temple and converted it into a prison. At the same time he began to repair the ruined town with the stones of the minaret; but before he had completed his labours, he was deprived of his employment, and was succeeded by Harun, son of Abi Khalid-al Maruruzi, and he was slain there.

Muhammed, son of Kasim then went to Nirun, the inhabitants of which place had already sent two Samanis, or priests, of their town to Hajjaj to treat for peace. They furnished Muhammad with supplies, and admitting him to enter the town, they were allowed to capitulate. Muhammad conquered all the towns successively which he met on his route, until he had crossed a river which runs on this side of the Mihran [Indus]. He then saw approaching towards him Sarbidas, the Samani, who came to demand peace in the name of the inhabitants. Muhammad imposed tribute upon them, and then went towards Sahban, and took it. Then he went to the banks

of the Mihran, and there remained. When this news reached Dahir, he prepared for battle. Muhammad, son of Kasim, had sent Muhammad, son of Musab, son of Abdu-r Rahman as Sakifi, to Sadusan, with men mounted on horses and asses, at whose approach the inhabitants solicited quarter and peace, the terms of which were negotiated by the Samani. Muhammad granted them peace, but he imposed tribute on the place, and took pledges from them, and then retuned to his master. He brought with him four thousand Jats, and left at Sadusan an officer in command.

Muhammad sought the means of crossing the Mihran, and effected the passage in a place which adjoined the dominions of Rasil, chief of Kassa, in Hind, upon a bridge which he had caused to be constructed. Dahir had neglected every precaution, not believing that the Musulmans would dare to advance so far. Muhammad and his Musulmans encountered Dahir mounted on his elephant, and surrounded by many of these animals, and his Takakaras [Thakurs] were near his person. A dreadful conflict ensued, such as had never been heard of. Dahir dismounted and fought valiantly, but he was killed towards the evening, when the idolater fled, and the Musulmans glutted themselves with massacre. According to Al Madaini, the slayer of Dahir was a man of the tribe of Kalab, who composed some verses upon the occasion…

Various authors concur in saying that Muhammad took the village of Rawar by assault, in which city there was a wife of Dahir, who, afraid of being captured, burned herself along with her handmaids and all that she possessed.

Then Muhammad, son of Kasim, went to old Brahmanabad, two parasangs from Manama, which town indeed did not then exist, it site being a forest. The remnant of the army of Dahir rallied at Brahmanabad and resistance being made, Muhammad was obliged to resort to force, when eight, or as some say, twenty-six thousand men were put to the sword. He left a prefect there. The place is now in ruins.

Muhammad then marched towards Alrur and Baghrur. The people of Sawandari came out to meet him and sued for peace, which was granted them, on the condition that they should entertain the Muhammadans and furnish guides. At this time they profess the Muhammadan creed. After that he went to Basmad, where the inhabitants obtained peace on the same terms as those accorded to the Sawandrians. At last he reached Alrur; one of the

cities of Sind. It is situated on a hill. Muhammad besieged it for several months, and compelled it to surrender promising to spare the lives of the inhabitants and not touch the temples *(budd)*. 'The temples' he said, "shall be unto us, like all the churches of the Christians, the synagogues of the Jews, and the fire temples of the Magians." He imposed, however, the tribute upon the inhabitants, and built a mosque in the city.

Muhammad advanced to Alsaka, a town on this side of the Biyas, which was captured by him, and is now in ruins. He then crossed the Biyas, and went towards Multan, where, in the action which ensued, Zaida, the son of Umur, of the tribe of Tai, covered himself with glory. The infidels retreated in disorder into the town, and Muhammad commenced the siege, but the provisions being exhausted, the Musulmans were reduced to eat asses. Then came there forward a man who sued for quarter, and pointed out to them an aqueduct, by which the inhabitants were supplied with drinking water from the river of Basmad. It flowed within the city into a reservoir like a well, which they call *talah.* Muhammad destroyed the watercourse; upon which the inhabitants, oppressed with thirst, surrendered at discretion. He massacred the men capable of bearing arms, but the children were taken captive, as well as the ministers of the temple, to the number of six thousand. The Musulmans found there much gold in a chamber ten cubits long by eight broad, and there was an aperture above, through which the gold was poured into the chamber. Hence, they call Multan "the Frontier of the House of Gold," for *farj* means 'a frontier.' The temple *(budd)* of Multan received rich presents and offerings, and to it the people of Sind resorted as a place of pilgrimage. They circumambulated it, and shaved their heads and beards. They conceived that the image was that of the prophet Job – God's peace be on him!…

Hakim, son of 'Awana al Kalbi, succeeded Tamim. The people of India had returned to idolatry excepting those of Kassa, and the Musulmans had no place of security in which they could take refuge, so he built a town on the other side of the lake facing India, and called it Al Mahfuza, 'the secure,' and this he made a place of refuge and security for them, and their chief town. He asked the elders of the tribe of Kalb, who were of Syrian descent, what name he should give the town. Some said Dimashk [Damascus], others, Hims [Emessa], and other Tadmur [Palmyra]. Hakim

said (to the latter), "May God destroy you, O fool." He gave it the name of Al Mahfuza, and dwelt there…

The Khalif al Mansur sent to Sind Hasham, son of 'Amru al Taghlabi, and he reduced those places which still held out. He sent 'Amru, son of Jamal, in boats to Narand. He also sent (a force) to the territories of Hind, subdued Kashmir, and took many prisoners and slaves. Sultan was reduced, and he overpowered a body of Arabs who were in Kandabil, and drove them out. He then went to Kandahar in boats, and conquered it. He destroyed the *budd* there, and built in its place a mosque. There was abundance in the country under his rule, and the people blessed him – he extended the frontier, and enforced his decrees…

Musa died in 221 A.H. (836 A.D.), leaving a high reputation, and he appointed his son Amran as his successor. The Khalif Mu'tasim bi-llah wrote to him confirming him in the government of the frontier. He marched to Kikan against the Jats, whom he defeated and subjugated. He built a city there, which he called Al Baiza, 'the white,' and he posted a military force there. Then he proceeded to Multan, and from thence to Kandabil which city stands upon a hill. Muhammad, the son of Khalil, was reigning there, but Amran slew him, conquered the town, and carried away its inhabitants to Kusdar. Then he made war upon the Meds, and killed three thousand of them. There he constructed a *band,* which is called 'Sakru-l Med,' *Band of the Meds*. He encamped on the river at Alrur. There he summoned the Jats, who came to his presence, when he sealed their hands, took from them the *jizya*, and he ordered that every man of them should bring a dog with him when he came to wait upon him, – hence the price upon a dog rose to fifty dirhams. He again attacked the Meds, having with him the chief men of the Jats. He dug a canal from the sea to their tank, so their water become salt; and he sent out several marauding expeditions against them…

Abu Bakr, who had been a slave of the Karizis, related to me that the country called Al 'Usaifan between Kashmir and Multan and Kabul, was governed by a wise king. The people of this country worshipped an idol for which they had built a temple. The son of the king fell sick, and he desired the ministers of the temple to pray to the idol for the recovery of his son. They retired for a short time, and then returned and said, "We have prayed and our supplications have been accepted." But no long time passed before the youth died. Then the king attacked the temple, destroyed and broke in

pieces the idol, and slew its ministers. He afterwards invited a party of Muhammadan traders who made known to him the unity of God. Hereupon he believed in the unity and became a Musulman. This happened in the Khalifat of Mu'tasim bi-llah, may God have mercy on him.

C. Amir Subuktigin's invasions

1. Subuktigin's first invasion of Hind, Al Utbi[3]

…he made frequent expeditions into Hind, in the prosecution of holy wars…When Jaipal had ascertained the calamity which had befallen him from the reports of the people who travelled in his country, and how Subuktigin was taking different parts of the territory into his own possession, and injuring everybody who opposed him in his projects of ambition the deepest grief seized him and made him restless, and his lands became narrow under his feet, though their expanse was broad. Then he arose with his relations and the generals of his army, and his vassals, and hastened with his huge elephants to wreak his revenge upon Subuktigin, by treading the field of Islam under his feet, and doing dishonour to that which should be treated with respect. In this disposition he marched on until he passed Lamghan, and approached the territory of Subuktigin, trusting to his own resources and power, for Satan had laid an egg in Jaipal's brain and hatched it; so that he waxed proud, entertaining absurd thoughts, and anticipating an immediate accomplishment of his wishes, impracticable as they were.

When the Amir heard of Jaipal's approach towards his territory, and of his great power, he girt up his loins to fight, and collecting his vassals and the Muhammadan forces whose duty it was to oppose infidels, he advanced from Ghazna against Jaipal, who was encamped between that place and Lamghan, with soldiers as black as night, and as impetuous as a torrent. Yaminu-d daula Mahmud accompanied Amir Subuktigin, like a lion of the forest or a destructive eagle, and they attempted no difficult undertaking which they did not easily accomplish.

The armies fought several days successively against each other, and cups filled to the brim with blood, drawn from wounds inflicted by sword and spear, circulated amongst them till they were drunken…

In consequence of the great fear which fell upon Jaipal, who confessed he had seen death before the appointed time, he sent a deputation to the Amir soliciting peace, on the promise of his paying down a sum of money, and offering to obey any order he might receive respecting his elephants and his country. The Amir Subuktigin consented on account of the mercy he felt towards those who were his vassals, or for some other reason which seemed expedient to him. But the Sultan Yaminu-d daula Mahmud addressed the messengers in a harsh voice, and refused to abstain from battle, until he should obtain a complete victory suited to his zeal for the honour of Islam and of Musulmans, and one which he was confident God would grant to his arms. So they returned, and Jaipal being in great alarm, again sent most humble supplications that the battle might cease, observing, "You have seen the impetuosity of the Hindus and their indifference to death, whenever any calamity befalls them, as at this moment. If, therefore, you refuse to grant peace in the hope of obtaining plunder, tribute, elephants and prisoners, then there is no alternative for us but to mount the horse of stern determination, destroy our property, take out the eyes of our elephants, cast our children into the fire, and rush on each other with sword and spear, so that all that will be left to you, is stones and dirt, dead bodies, and scattered bones."

When the Amir heard these words and knew what Jaipal would do in his despair, he thought that religion and the views of the faithful would best be consulted by peace, and the acquisition of tribute. So the Amir Mahmud agreed with Subuktigin as to the propriety of withdrawing the hand of vengeance, on the condition of receiving at that time 1,000,000 dirhams of royal stamp, and fifty elephants, and some cities and forts in the middle of his country. Jaipal was to deliver these forts to the officers nominated by the Amir, and was to send hostages from among his relatives and friends to remain with the Amir until these conditions of cession were fulfilled. The Amir sent two deputies with Jaipal to see that he did not swerve from his en-gagements, and they were accompanied by confidential officers who were to receive charge of the ceded places.

When Jaipal had marched to a great distance, and thought that the demand upon him had relaxed, and that the rope round his throat was loosened, his bad disposition suggested to him to break his engagements, and his folly made him beget enmity, insomuch that he imprisoned those who

accompanied him on the part of the Amir, in reprisal for those of his relations whom the Amir had taken as hostages.

2. Amir Subuktigin's second invasion of Hind, Al-Utbi[4]

…The Amir marched out towards Lamghan, which is a city celebrated for its great strength and abounding in wealth. He conquered it and set fire to the places in its vicinity which were inhabited by infidels, and demolishing the idol-temples, he established Islam in them. He marched and captured other cities and killed the polluted wretches, destroying the idolatrous and gratifying the Musulmans. After wounding and killing beyond all measure, his hands and those of his friends became cold in counting the value of the plundered property. On the completion of his conquest he returned and promulgated accounts of the victories obtained for Islam, and everyone, great and small, concurred in rejoicing over this result and thanking God…

D. Some conquests of Mahmud of Ghazni

1. Defeat of Jaipal by Mahmud of Ghazni, Al-Utbi[5]

Sultan Mahmud at first designed in his heart to go to Sijistan, but subsequently preferred engaging previously in a holy war against Hind… On his reaching Purshaur (Peshawar), he pitched his tent outside the city. There he received intelligence of the bold resolve of Jaipal, the enemy of God, and the King (malik) of Hind, to offer opposition, and of his rapid advance towards meeting his fate in the field of battle…

Swords flashed like lightning amid the blackness of clouds, and fountains of blood flowed like the fall of setting stars. The friends of God defeated their obstinate opponents, and quickly put them to a complete rout. Noon had not arrived when the Musulmans had wreaked their vengeance on the infidel enemies of God, killing 15,000 of them, spreading them like a carpet over the ground, and making them food for beasts and birds of prey. Fifteen elephants fell on the field of battle, as their legs, being pierced with arrows, became as motion-less as if they had been in a quagmire, and their trunks were cut with the swords of the valiant heroes.

The enemy of God, Jaipal, and his children and grandchildren, and nephews, and the chief men of his tribe, and his relatives, were taken prisoners, and being strongly bound with ropes, were carried before the Sultan, like as evildoers, on whose faces the fumes of infidelity are evident,

who are covered with the vapours of misfortune, will be bound and carried to Hell. Some had their arms forcibly tied behind their backs, some were seized by the cheek, some were driven by blows on the neck. The necklace was taken off the neck of Jaipal, – composed of large pearls and shining gems and rubies set in gold, of which the value was two hundred thousand dinars; and twice that value was obtained from the necks of those of his relatives who were taken prisoners, or slain, and had become the food of the mouths of hyenas and vultures. God also bestowed upon his friends such an amount of booty as was beyond all bounds and all calculation, including five hundred thousand slaves, beautiful men and women.…

After the victory, the Sultan directed that the polluted infidel, Jaipal, should be paraded about, so that his sons and chieftains might see him in that condition of shame, bonds, and disgrace; and that the fear of Islam might fly abroad through the country of the infidels. He then entered into conditions of peace with him, after demanding fifty elephants, and took from him as hostages his son and grandson, till he should fulfil the conditions imposed upon him.

The infidel returned to his own country and remained there, and wrote to his son, Andpal, whose territory, on which he prided himself, was on the other side of the Sihun (Indus), explaining the dreadful calamity which had befallen him, and beseeching him with many entreaties to send the elephants which were according to agreement to be given to the Sultan. Upon this And-pal sent the elephants to Jaipal, after dismissing the courier who had brought the letter, and the elephants were sent on to the Sultan. The Sultan, therefore, ordered the release of the hostages, and his myrmidons gave them a smack on the buttocks, telling them to return to their country.

Andpal reflected that his father, Jaipal, had put on the sheaf of old age, and had fallen under the influence of Lyra and other unlucky constellations, and it was time he should contemplate his death and devote himself to religious exercises. There is a custom among these men that if anyone is taken prisoner by an enemy, as in this case Jaipal was by the Musulmans, it is not lawful for him to continue to reign. When Jaipal, therefore, saw that he was captive in the prison of old age and degradation, he thought death by cremation preferable to shame and dishonour. So he commenced with shaving his hair off, and then threw himself upon the fire till he was burnt.

2. The Hindu Shahis – men of noble bearing, Alberuni[6]

The Hindus had kings residing in Kabul, Turks who where said to be of Tibetan origin…

The last king of this race was *Lagaturman,* and his Vazir was Kallar, a Brahman…. Now the Vazir put him in chains and imprisoned him for correction, but then he himself found ruling sweet, his riches enabled him to carry out his plans, and so he occupied the royal throne. After him ruled the Brahman kings Samand (Samanta), Kamalu, Bhim (Bhima), Jaipal (Jayapala), Ananda-pala, Tarojanapala (Trilocanapala). The latter was killed A.H. 412 (A.D. 1021), and his son Bhimapala five year later (A.D. 1026).

This Hindu Shahiya dynasty is now extinct, and of the whole house there is no longer the slightest remnant in existence. We must say that, in all their grandeur, they never slackened in the ardent desire of doing that which is good and right, that they were men of noble sentiment and noble bearing.

3. Conquest of Bhatia, *Kamilu-T Tawarikh,* Ibn Asir[7]

In the year 396 Hijra (1006 A.D.) Yaminu-d daula fought against Bhatia, one of the dependencies of Hind, which is situated beyond Multan. The chief of the place was named Bahira. It is a fine city, enclosed with high walls, and a deep ditch. The chief marched out to meet his enemy, and fought for three days with the Musulmans. On the fourth he fled, and sought to get back into the city; but the Musulmans reached the gate before the fugitives overpowered them, and disarmed them. A dreadful slaughter ensued, the women were dishonoured, and the property seized. When Bahira saw this destruction; he fled with some trusty followers to the tops of the mountains. Mahmud sent a force in pursuit, which overtook and surrounded the party, and put all the chiefs to the sword. Bahira saw that no hope was left, so he drew a dagger and killed himself. Mahmud remained in Bhatia until he had settled its affairs, and drawn up rules for its governance. He then returned towards Ghazna, having appointed a representative at Bhatia to instruct the people who had become Muhammadans. On his journey home he encountered great difficulties from heavy rains and swollen rivers, and great quantities of things belonging to him and his army were carried away by the waters.

4. Victory near Waihind, Al-Utbi[8]

The Sultan, contrary to the disposition of man, which induces him to prefer a soft to a hard couch, and the splendour of the cheeks of pomegranate-bosomed girls to well-tempered sword blades, was so offended at the standard which Satan had raised in Hind, that he determined on another holy expedition to that land. On the last day of Rabi'u-l-akhir of the same year, the Sultan prayed God for the accomplishment of his wishes. When he had reached as far as the river of Waihind, he was met by Brahmanpal, the son of Andpal, at the head of a valiant army, with white swords, blue spears, yellow coats of mail, and ash-coloured elephants. Fight opened its crooked teeth, attacks were frequent like flaming meteors, arrows fell like rain from bows, and the grinding-stone of slaughter revolved, crushing the bold and the powerful. The battle lasted from morning till evening, and the infidels were near gaining the victory, had not God aided by sending the slaves of the household to attack the enemy in rear, and put them to fight. The victors obtained thirty large elephants, and slew the vanquished wherever they were found in jungles, passes, plains, and hills.

5. Capture of Bhimnagar, Al-Utbi[9]

The Sultan himself joined in the pursuit, and went after them as far as the fort called Bhimnagar [Nagarkot, modern Kangra], which is very strong, situated on the promontory of a lofty hill, in the midst of impassable waters. The kings of Hind, the chiefs of that country, and rich devotees, used to amass their treasures and precious jewels, and send them time after time to be presented to the large idol that they might receive a reward for their good deeds and draw near to their God. So the Sultan advanced near to this crow's fruit [probably an allusion to the expression of the blackness of the Hindus], and this accumulation of years, which had attained such an amount that the backs of camels would not carry it, nor vessels contain it, nor writers' hands record it, nor the imagination of an arithmetician conceive it.

The Sultan brought his forces under the fort and surrounded it, and prepared to attack the garrison vigorously, boldly, and wisely. When the defenders saw the hills covered with the armies of plunderers, and the arrows ascending towards them like flaming sparks of fire, great fear came upon them, and, calling out for mercy, they opened the gates, and fell on the earth, like sparrows before a hawk, or rain before lightning. Thus did God

grant an easy conquest of this fort to the Sultan, and bestowed on him as plunder the products of mines and seas, the ornaments of heads and breasts, to his heart's content. The Sultan entered the fort with Abu Nasr Ahmad bin Muhammad Farighuni, the ruler of Juzjan, and all his own private attendants, and appointed his two chief chamberlains, Altuntash and Asightigiu, to take charge of the treasures of gold and silver and all the valuable property, while he himself took charge of the jewels. The treasures were laden on the backs of as many camels as they could procure, and the officers carried away the rest. The stamped coin amounted to seventy thousand thousand royal dirhams, and the gold andi silver ingots amounted to seven hundred thousand four hundred *mans* in weight, besides wearing apparel and fine cloths of Sus, respecting which old men said they never remembered to have seen any so fine, soft, and embroidered. Among the booty was a house of white silver, like to the houses of rich men, the length of which was thirty yards and the breadth fifteen. It could be taken to pieces and put together again. And there was a canopy, made of the fine linen of Rum, forty yards long and twenty broad, supported on two golden and two silver poles, which had been cast in moulds.

The Sultan appointed one of his most confidential servants to the charge of the fort and the property in it. After this he returned to Ghazna in triumph; and, on his arrival there, he ordered the courtyard of his palace to be covered with a carpet, on which he displayed jewels and unbored pearls and rubies, shining like sparks, or like wine congealed with ice, and emeralds like fresh sprigs of myrtle, and diamonds in size and weight like pomegranates. Then ambassadors from foreign countries, including the envoy from Taghan Khan, king of Turkistan, assembled to see the wealth which they had never yet even read of in books of the ancients, and which had never been accumulated by kings of Persia or of Rum, or even by Karun who had only to express a wish and God granted it.

6. Conquest of Tanesar, Al-Utbi[10]

The Sultan learnt that in the country of Tanesar there were large elephants of the Sailaman breed, celebrated for military purposes. The chief of Tanesar was on this account obstinate in his infidelity and denial of God. So the Sultan marched against him with his valiant warriors, for the purpose of planting the standards of Islam and extirpating idolatry. He marched

through a desert which no one had yet crossed, except birds and wild beasts, for the foot of man and the shoe of horse had not traversed it. There was no water in it, much less any other kind of food. The Sultan was the first to whom God had granted a passage over this desert, in order that he might arrive at the accomplishment of his wishes.

Beneath it (Tanesar) flowed a pure stream; the bottom was covered with large stones, and its banks were precipitous and sharp as the points of arrows. The Sultan had reached this river where it takes its course through a hill-pass, behind which the infidels had posted themselves, in the rear of their elephants, with a large number of infantry and cavalry. The Sultan adopted the stratagem of ordering some of his troops to cross the river by two different fords, and to attack the enemy on both sides…

The blood of the infidels flowed so copiously, that the stream was discoloured, notwithstanding its purity, and people were unable to drink it. Had not night come on and concealed the traces of their flight, many more of the enemy would have been slain. The victory was gained by God's grace, who had established Islam for ever as the best of religions, notwithstanding that idolaters revolt against it. The Sultan returned with plunder which it is impossible to recount. – Praise be to God, the protector of the world, for the honour he bestows upon Islam and Musulmans!

7. Capture of Mathura, Al-Utbi[11]

The Sultan then departed from the environs of the city, in which was a temple of the Hindus. The name of this place was Maharatu-l Hind. He saw there a building of exquisite structure, which the inhabitants said had been built, not by men, but by Genii, and there he witnessed practices contrary to the nature of man, and which could not be believed but from evidence of actual sight. The wall of the city was constructed of hard stone, and two gates opened upon the river flowing under the city, which were erected upon strong and lofty foundations, to protect them against the floods of the river and rains. On both sides of the city there were a thousand houses, to which idol temples were attached, all strengthened from top to bottom by rivets of iron, and all made of masonry work; and opposite to them were other buildings, supported on broad wooden pillars, to give them strength.

In the middle of the city there was a temple larger and firmer than the rest, which can neither be described nor painted. The Sultan thus wrote

respecting it : “If any should wish to construct a building equal to this, he would not be able to do it without expending an hundred thousand thousand red dinars, and it would occupy two hundred years, even though the most experienced and able workmen were employed.” Among the idols there were five made of red gold, each five yards high, fixed in the air without support. In the eyes of one of these idols there were two rubies, of such value, that if anyone were to sell such as are like them, he would obtain fifty thousand dinars. On another, there was a sapphire purer than water, and more sparkling than crystal; the weight was four hundred and fifty miskals. The two feet of another idol weighed four thousand four hundred miskals, and the entire quantity of gold yielded by the bodies of these idols, was ninety-eight thousand three hundred miskals. The idols of silver amounted to two hundred, but they could not be weighed without breaking them to pieces and putting them into scales. The Sultan gave orders that all the temples should be burnt with naphtha and fire, and levelled with the ground.

8. The Conquest of Kanauj, Al-Utbi[12]

…The Sultan advanced to the fortifications of Kanauj, which consisted of seven distinct forts, washed by the Ganges, which flowed under them like the ocean. In Kanauj there were nearly ten thousand temples, which the idolaters falsely and absurdly represented to have been founded by their ancestors two or three hundred thousand years ago. They worshipped and offered their vows and supplications to them, in consequence of their great antiquity. Many of the inhabitants of the place fled and were scattered abroad like so many wretched widows and orphans, from the fear which oppressed them, in consequence of witnessing the fate of their deaf and dumb idols. Many of them thus effected their escape, and those who did not fly were put to death. The Sultan took all seven forts in one day, and gave his soldiers leave to plunder them and take prisoners.

9. Mahmud’s conquests ruined India, Alberuni[13]

Mahmud utterly ruined the prosperity of the country, and performed there wonderful exploits, by which the Hindus became like atoms of dust scattered in all directions, and like a tale of old in the mouth of the people. Their scattered remains cherish, of course, the most inveterate aversion towards and Muslims. This is the reason, too, why Hindu sciences have

retired far away from those parts of the country conquered by us, and have fled to places which our hand cannot yet reach, to Kashmir, Benares, and other places. And there the antagonism between them and all foreigners receives more and more nourishment both from political and religious sources.

10. Mahmud the first Muhammadan king to receive title of Sultan from the Khalifa, Ibn Asir[14]

Sultan Mahmud was a great monarch. He was the first Muhammadan king who received the title of Sultan from the Khalif. He was born on the night of Thursday, the tenth of Muharram, A.H. 361 (2nd October, 971), in the seventh year after the time of Bilkatigin. A moment (*sa'at*) before his birth, Amir Subuktigin saw in a dream that a tree sprang up from the fireplace in the midst of his house, and grew so high that it covered the whole world with its shadow. Waking in alarm from his dream, he began to reflect upon the import of it. At that very moment a messenger came, bringing the tidings that the Almighty had given him a son. Subuktigin greatly rejoiced, and said, I name the child Mahmud. On the same night that he was born, an idol temple in India, in the vicinity of Parshawar, on the banks of the Sind, fell down.

Mahmud was a man of great abilities, and is renowned as one of the greatest champions of Islam. He ascended the throne in Balkh, in the year 387 H. (997A.D.), and received investiture by the Khalifa Al Kadir bi-llah. His influence upon Islam soon became widely known, for he converted as many as a thousand idol-temples into mosques, subdued the cities of Hindustan, and vanquished the Rais of that country. He captured Jaipal, who was the greatest of them, kept him at Yazd (?), in Khurasan, and gave orders so that he was bought for eighty dirams. He led his armies to Nahrwala and Gujarat, carried off the idol (*manat*) from Somnat, and broke it into four parts. One part he deposited in the Jami Masjid of Ghazni, one he placed at the entrance of the royal palace, the third he sent to Mecca, and the fourth to Medina. Unsuri composed a long *Kasida* on this victory.

E. Tilak the Hindu, Abu-l Fazl Al Baihaki[15]

This Tilak was the son of a barber, but he was handsome in face and appearance, and had an eloquent tongue. He wrote an excellent hand, both

in Hindi and Persian. He had lived a long time in Kashmir, where he studied and acquired some proficiency in dissimulation, amours, and witchcraft. From thence he came to Kazi Shiraz Bu-l Hasan, who was captivated by him, for every great man who saw him was enamoured of him. The Kazi restrained him from going anywhere else; but Tilak contrived by stratagem to have his case, and the iniquity of which the Kazi was capable, reported to the great Khwaja Ahmad Hasan (May God be pleased with him). There was ill-feeling between the Khwaja and the Kazi. The Khwaja sent royal orders with three peons, and to the great disgust of the Kazi they brought Tilak to the court. Khwaja Ahmad Hasan heard what he had to say, saw the way clear before him, and took measures to have the matter brought to the notice of Amir Mahmud in such a manner that he did not know the Khwaja had contrived the means. The Amir ordered the Khwaja to hear Tilak's complaint, and the Kazi fell into great difficulty.

After this event Tilak became one of the great confidants of the Khwaja. He was made his secretary and interpreter between him and the Hindus. Thus he acquired great influence in the minister's court, where I, says Bu-l Fazi, used to see him standing before the Khwaja, doing the duties of a secretary and interpreter, and carrying and bringing messages, and managing difficult affairs. When that trouble fell on the Khwaja, which I have before mentioned, Amir Mahmud called together his servants and secretaries, in order that he might appoint the most clever to offices in his court. Tilak met with his approval, and was associated as interpreter with Bahram. He was a young man and a clever speaker. Amir Mahmud wanted such persons. His fortune thus improved. Secretly he rendered valuable services to Sultan Masud, that is, he brought all the Hindu Kators and many outsiders under his rule, and he obtained honour from such a great king as Mahmud.

When Shah Masud arrived in Balkh from Hirat and the affairs of the country were settled, Sundar, the general of the Hindus, was not in his place. He therefore promoted Tilak, and granted him a gold embroidered robe, hung a jewelled necklace of gold round his neck, and placed an army under him. Thus he obtained the name of man. A tent and an umbrella were also given to him. Kettle drums were beaten at his quarters, according to the custom of the Hindu chiefs, and banners with gilded tops were granted. Fortune befriended him; he was elevated to such a degree as to sit among

the nobles in the privy councils, and as I have said, he was employed in important duties, until at length he undertook the command against Ahmad Nialtigin. His luck and fortune aided him, and carried him through. The Arabs say, "There is a cause for everything, and men must seek it." Wise men do not wonder at such facts, because nobody is born great – men become such. But it is important that they should leave a good name behind. This Tilak soon became a man, and had excellent qualities. All the time he lived he sustained no injury on account of being the son of a barber. But if with such a character, wisdom and spirit, he had been of good extraction, he would have been better, for nobility and talents are both very agreeable. But nobility is good for nothing, if learning, propriety and spirit are wanting.

F. Ahmad Nialtigin at Banaras, Abu-l Fazl Al Baihaki[16]

Unexpectedly (na-gah) he arrived at a city which is called Banaras and which belonged to the territory of Gang. Never had a Muhammadan army reached this place. The city was two parasangs square, and contained plenty of water. The army could only remain there from morning to mid-day prayer because of the peril. The markets of the drapers, perfumers, and jewellers, were plundered, but it was impossible to do more. The people of the army became rich, for they all carried off gold, silver, perfumes, and jewels, and got back in safety…

G. Muhammad Ghori

1. Muhammad Ghori's defeat by the Rai of Nahrwala, Minhaju-s Siraj[17]

In the year after this victory he conducted his army by way of Uch and Multan towards Nahrwala. The Rai of Nahrwala, Bhim-deo, was a minor, but he had a large army and many elephants. In the day of battle the Muhammadans were defeated and the Sultan was compelled to retreat. This happened in the year 574 H. (1178 A.D.).

2. Battle of Tarain, Minhaju-s Siraj[18]

Rai Kolah Pithaura came up against the fort, and the Sultan returned and faced him at Narain. All the Rais of Hindustan were with the Rai Kolah. The battle was formed and the Sultan, seizing a lance, made a rush upon the elephant which carried Gobind Rai of Delhi. The latter advanced to meet him in front of the battle, and then the Sultan, who was a second Rustam, and the Lion of the Age, drove his lance into the mouth of the Rai and knocked two of the accursed wretch's teeth down his throat. The Rai, on the other hand, returned the blow and inflicted a severe wound on the arm of his adversary. The Sultan reined back his horse and turned aside, and the pain of the wound was so insufferable that he could not support himself on horseback. The Musulman army gave way and could not be controlled. The Sultan was just falling when a sharp and brave young Khilji recognised him, jumped upon the horse behind him, and clasping him round the bosom, spurred on the horse and bore him from the midst of the fight.

When the Musulmans lost sight of the Sultan, a panic fell upon them; they fled and halted not until they were safe from the pursuit of the victors. A party of nobles and youths of Ghor had seen and recognised their leader with that lionhearted Khilji, and when he came up they drew together, and, forming a kind of litter with broken lances, they bore him to the halting-place. The hearts of the troops were consoled by his appearance, and the Muhammadan faith gathered new strength in his life. He collected the scattered forces and retreated to the territories of Islam, leaving Kazi Tolak in the fort of Sarhind. Rai Pithaura advanced and invested the fort, which he besieged for thirteen months.

Next year the Sultan assembled another army, and advanced to Hindustan to avenge his defeat. A trustworthy person named Mu'inu-d din, one of the principal men of the hills of Tolak, informed me that he was in this army, and that its force amounted to one hundred and twenty thousand horsemen bearing armour. Before the Sultan could arrive the fort of Sarhind had capitulated, and the enemy were encamped in the vicinity of Narain. The Sultan drew up his battle array, leaving his main body in the rear, with the banners, canopies, and elephants, to the number of several divisions. His plan of attack being formed, he advanced quietly. The light unarmoured horsemen were made into four divisions of 10,000, and were directed to advance and harass the enemy on all sides, on the right and on the left, in the front and in the rear, with their arrows. When the enemy collected his

forces to attack, they were to support each other, and to charge at full speed. By these tactics the infidels were worsted, the Almighty gave us the victory over them, and they fled.

Pithaura alighted from his elephant, mounted a horse, and galloped off but he was captured near Sarsuti, and sent to hell. Gobind Rai, of Delhi, was killed in the battle, and the Sultan recognised his head by the two teeth which he had broken. The capital, Ajmir, and all the Siwalik hills, Hansi, Sarsuti, and other districts were the results of this victory, which was gained in the year 588 H. (1192 A.D.)

3. Conquest of Ajmer by Muhammad Ghori, Hasan Nizami[19]

He accordingly prepared for an expedition against the Rai [of Ajmer], and mounted his steed, of which there is a poetical description "The victorious army on the right and on the left departed towards Ajmir." "When the Kola (natural son) of the Rai of Ajmir, the vaunts of whose courage had reached the ears of far and near, heard of the approach of the auspicious standard and the victorious armies, he advanced for the purpose of fighting, and having adjusted the robe of slaughter and the arms of battle, marched on over hills and deserts with a well-equipped army, the number which cannot be conceived in the picture gallery of the imagination."…

The army of Islam was completely victorious, and "an hundred thousand grovelling Hindus swiftly departed to the fire of hell." The Rai of Ajmir was taken prisoner during the action, but his life was spared. After this great victory, the army of Islam marched forward to Ajmir, where it arrived at a fortunate moment and under an auspicious bird, and obtained so much booty and wealth, that you might have said, that the secret depositories of the seas and hills had been revealed."

While the Sultan remained at Ajmir, "he destroyed the pillars and foundations of the idol temples, and built in their stead mosques and colleges, and the precepts of Islam, and the customs of the law were divulged and established."

4. The conquest of Delhi by Muhammad Ghori, Hasan Nizami[20]

After settling the affairs of Ajmir, the conqueror marched "towards Dehli (may God preserve its prosperity and perpetuate its splendour!) which is among the chief (mother) cities of Hind." When he arrived at Dehli, he saw "a fortress which in height and strength had not its equal nor second

throughout the length and breadth of the seven climes." The army encamped around the fort. "A torrent of blood flowed on the field of battle, and it became evident to the chiefs that if they did not seek for safety from the sword of the king of the earth, and if they should deliver into the hands of Satan the time of option and the reins of good counsel, the condition of Dehli would be like that of Ajmir; so from the dread of kingly punishment, the Rai and mukaddams of that country placed their heads upon the line of slavery, and their feet within the circle of obedience, and made firm the conditions of tribute (*malguzari*) and the usages of service."

The Sultan then returned "towards the capital of Ghazna (may God preserve it in prosperity!)" but "the army remained encamped within the boundary of Dehli, at the *mauza* of Indarpat (Indraprastha)."

5. The flight of Jatwan [probably a leader of the Jats] and his death in battle, Hasan Nizami[21]

"When the honoured month of Ramazan, 588 H., the season of mercy and pardon, arrived, fresh intelligence was received at the auspicious Court, that the accursed Jatwan, having admitted the pride of Satan into his brain, and placed the cup of chieftainship and obstinacy upon his head, had raised his hand in fight against Nusratu-d din, the Commander, under the fort of Hansi, with an army animated by one spirit."

Kutbu-d din mounted his horse, and "marched during one night twelve parasangs." "The accursed Jatwan, when he heard the news of the arrival of the victorious armies, felt himself compelled to depart from under the fort," and fled. "The soldiers of Islam came up to the army of Hind on the borders of Bagar; and although Jatwan saw there was no chance of successful opposition in battle, yet as he saw destruction impending on him from the throat of the dragon, and the road for flight was blocked up, and the standards of the State and royal victory were unfurled, yielding to the necessity of the case, and not at his own option," he prepared for fight, and the noise of the hautbois and shells confounded the world, the thunder of the drums ascended to heaven, and the blast of the brazen clarions resembled the sounding trump (of resurrection.)"

The armies attacked each other "like two hills of steel, and the field of battle became tulip-dyed with the blood of the warriors." The Hindus were completely defeated, and their leader slain. "Jatwan, who was the essence

of vice and turbulence, and the rod of infidelity and perverseness, the friend of grief, and the companion of shame, had his standards of God-plurality and ensigns of perdition lowered by the hand of power;" "and the dust of the field of battle was commingled with the blood of that God- abandoned wretch, and the whole country was washed from the filth of his idolatry."

6. Fight with the Rai of Banaras and capture of Asni, Hasan Nizami[22]

When the army was mustered, it was found to amount to "fifty thousand mounted men clad in armour and coats of mail," with which they advanced to fight against the Rai of Benares. The king ordered Kutbu-d din to proceed with the vanguard, consisting of one thousand cavalry, which fell upon "the army of the enemies of religion," and completely defeated it. On its return to the king, the officers were presented with robes of honour.

"The Rai of Benares, Jai Chand, the chief of idolatry and perdition, advanced to oppose the royal troops with an army, countless as the particles of sand," and the noise of the war-drum proclaimed to the ears of the worshippers of one God, aid comes from the Almighty, and the sound of the silver kettledrum and the blast of the brazen trumpets resounded to heaven." "The Rai of Benares, who prided himself on the number of his forces and war elephants," seated on a lofty howdah, received a deadly wound from an arrow, and fell from his exalted seat to the earth." His head was carried on the point of a spear to the commander, and "his body was thrown to the dust of contempt." "The impurities of idolatry were purged by the water of the sword from that land, and the country of Hind was freed from vice and superstition."

"Immense booty was obtained, such as the eye of the beholder would be weary to look at," including one (some copies say three) hundred elephants. The royal army then took possession "of the fort of Asni where the treasure of the Rai was deposited," and there much more precious spoil of all kinds rewarded the victors.

7. The capture of Banaras, Hasan Nizami[23]

From that place the royal army proceeded towards Benares, "which is the centre of the country of Hind," and here they destroyed nearly one thousand temples, and raised mosques on their foundations; and the knowledge of the law became promulgated, and the foundations of religion were established;"

“and the face of the dinar and the diram was adorned with the name and blessed titles” of the king.

8. The capture of Gwalior, Hasan Nizami[24]

When the affairs of this tract was settled, the royal army marched, in the year 592 H., (1196 A.D.) “towards Galewar (Gwalior), and invested that fort, which is the pearl of the necklace of the castles of Hind, the summit of which the nimble-footed wind from below cannot reach, and on the bastion of which the rapid clouds have never cast their shade, and which the swift imagination has never surmounted, and at the height of which the celestial sphere is dazzled.”...

“Rai Solankh Pal who had raised the standard of infidelity, and perdition, and prided himself on his countless army and elephants, and who expanded the fist of oppression from the hiding place of deceit, and who had lighted the flame of turbulence and rebellion, and who had fixed the root of sedition and enmity firm in his heart, and in the courtyard of whose breast the shrub of tyranny and commotion had shot forth its branches, when he saw the power and majesty of the army of Islam,” he became alarmed and dispirited. “Wherever he looked, he saw the road of flight blocked up.” He therefore “sued for pardon, and placed the ring of servitude in his ear,” and agreed to pay tribute, and sent ten elephants as a peace offering, in which he was graciously admitted to protection, and was allowed to retain his fort. “When the neighbouring country was freed from the enemies of religion, and the Rai of Hind became enrolled amongst the number of servants and friends,” the Sultan prepared to return to Ghazna, and Kutbu-d din, after his departure, returned to Dehli, where festivities were celebrated on his arrival. – Praise of wine-bibbing and cup-bearers.

9. The conquest of Nahrwala, the most celebrated city of Gujarat, Hasan Nizami[25]

“In the middle of the month of Safar, 593 H. (Jan., 1197), the world-conquering Khusru departed from Ajmir, and with every description of force turned his face towards the annihilation of the Rai of Nahrwala.” When he reached the lofty forts of Pali and Nandul, he found them abandoned, and the abode of owls, for the people had fled at the approach of the Musulmans, and had collected under their leaders Rai Karan and Darabars, in great numbers” at the foot of Mount Abu, and at the mouth of a

pass stood ready for fight and slaughter." The Musulmans did not dare to attack them in that strong position, especially as in that very place Sultan Muhammad Sam Ghori had been wounded, and it was considered of bad omen to bring on another action there, lest a similar accident might occur to the commander. The Hindus seeing this hesitation, and misconstruing it into cowardice and alarm, abandoning the pass, "turned their faces towards the field of battle and the plain of honour and renown;" for "they were persuaded that fear had established itself in the hearts of the protectors of the seared enclosure of religion." "The two armies stood face to face for some time, engaged in preparations for fight, and on the night preceding Sunday, the 13th of Rabi'u-l awwal, in a fortunate moment the army of Islam advanced from its camp, and at morn reached the position of the infidels." A severe action ensued from dawn to mid-day, when "the army of idolatry and damnation turned its back in flight from the line of battle. Most of their leaders were taken prisoners, and nearly fifty thousand infidels were despatched to hell by the sword, and from the heaps of the slain, the hills and the plains became of one level." Rai Karan effected his escape from the field. "More than twenty thousand slaves, and twenty elephants, and cattle and arms beyond all calculation, fell into the hands of the victors." "You would have thought that the treasures of the kings of all the inhabited world had come into their possession."

10. Capture of the fort of Kalinjar, Hasan Nizami[26]

In the year 599 H. (1202 A.D.), Kutbu-d din proceeded to the investment of Kalinjar, on which expedition he was accompanied by the Sahib-Kiran, Shamsu-d din Altamsh. 'The accursed Parmar,' the Rai of Kalinjar, fled into the fort after a desperate resistance in the field, and afterwards surrendered himself, and "placed the collar of subjection" round his neck, and, on his promise of allegiance, was admitted on the same favours as his ancestor had experienced from Mahmud Subuktigin, and engaged to make a payment of tribute and elephants, but he died a natural death before he could execute any of his engagements. His Diwan, or Mahtea, by name Aj Deo, was not disposed to surrender so easily as his master, and gave his enemies much trouble, until he was compelled to capitulate, in consequence of severe drought having dried up all the reservoirs of water in the forts. "On Monday, the 20th of Rajab, the garrison, in an extreme state of weakness

and distraction, came out of the fort, and by compulsion left their native place empty," "and the fort of Kalinjar which was celebrated throughout the world for being as strong as the wall of Alexander" was taken. "The temples were converted into mosques and abodes of goodness, and the ejaculations of the bead-counters and the voices of the summoners to prayer ascended to the highest heaven, and the very name of idolatry was annihilated." "Fifty thousand men came under the collar of slavery, and the plain became black as pitch with Hindus." Elephants and cattle, and countless arms also became the spoil of the victors.

11. Death of Sultan Muhammad Sam, Hasan Nizami[27]

On the king's return from Lahore towards Ghazni, he had fixed his camp "within the borders of Dhamek, and his tent was pitched on the bank of a pure stream in a garden filled with lilies, jasmins," and other flowers. Here while he was engaged in his evening prayer, "some impious men (God's curse and destruction on them!) came running like the wind towards his majesty, the king of the world, and on the spot killed three armed attendants and two chamber-sweepers. They then surrounded the king's own tent, and one or two men out of these three or four conspirators, ran up towards the king, and inflicted five or six desperate wounds upon the lord of the seven climes, and his spirit flew above the eight paradises and the battlements of the nine heavens, and joined those of the ten evangelists."

12. Death of Muhammad Ghori, Alau-d din Juwaini[28]

In the year 602 H. (1205 A.D.), Muhammad Ghori determined on prosecuting a holy war in Hind, in order to repair the fortunes of his servants and armies; for within the last few years Khurasan, on account of the disasters it had sustained, yielded neither men nor money. When he arrived in Hind, God gave him such a victory that his treasures were replenished, and his armies renewed. On his return, after crossing the Jailam, he was encamped on the banks of the Jihun (Indus), so that one-half of the royal enclosure, where the private apartments were, was in the water. In consequence of which no precaution had been taken to ensure their protection. About the time of the mid-day siesta, two or three Hindus came through the water, and falling like fire upon the royal tent, slew the Sultan, who was entirely unprepared for such a treacherous attack.

H. Malik Ghazi Ikhtiyaru-d din Muhammad Bakhtiyar Khilji, of Lakhnauti

1. Invasion of Bihar and Bengal, Minhaju-s Siraj[29]

It is related that this Muhammad Bakhtiyar was a Khilji, of Ghor, of the province of Garmsir. He was a very smart, enterprising, bold, courageous, wise, and experienced man…Being a bold and enterprising man, he used to make incursions into the districts of Munir (Monghir), and Behar, and bring away much plunder, until in this manner he obtained plenty of horses, arms, and men. The fame of his bravery and of his plundering raids spread abroad, and a body of Khiljis joined him from Hindustan. His exploits were reported to Sultan Kutbu-d din, and he sent him a dress and showed him great honour. Being thus encouraged, he led his army to Behar and ravaged it. In this manner he continued for a year or two to plunder the neighbourhood, and at last prepared to invade the country.

It is said by credible persons that he went to the gate of the fort of Behar with only two hundred horse, and began the war by taking the enemy unawares. In the service of Bakhtiyar there were two brothers of great intelligence. One of them was named Nizamu-d din and the other Samsamu-d din. The compiler of this book met Samsamu-d din at Lakhnauti in the year 641 H. (1243 A.D.), and heard the following story from him. When Bakhtiyar reached the gate of the fort, and the fighting began, these two wise brothers were active in that army of heroes. Muhammad Bakhtiyar with great vigour and audacity rushed in at the gate of the fort and gained possession of the place. Great plunder fell into the hands of the victors. Most of the inhabitants of the place were Brahmans with shaven heads. They were put to death. Large numbers of books were found there, and when the Muhammadans saw them, they called for some persons to explain their contents, but all the men had been killed. It was discovered that the whole fort and city was a place of study (*madrasa*). In the Hindi language the word Behar (*vihar*) means a college….

After receiving a robe from the Sultan he returned to Behar. Great fear of him prevailed in the minds of the infidels of the territories of Lakhnauti, Behar, Bang (Bengal), and Kamrup.

It is related by credible authorities that mention of the brave deeds and conquests of Malik Muhammad Bakhtiyar was made before Rai Lakhmaniya, whose capital was the city of Nudiya…

Next year Muhammad Bakhtiyar prepared an army, and marched from Behar. He suddenly appeared before the city of Nudiya with only eighteen horsemen, the remainder of his army was left to follow. Muhammd Bakhtiyar did not molest any man, but went on peaceably and without ostentation, so that no one could suspect who he was. The people rather thought that he was a merchant, who had brought horses for sale. In this manner he reached the gate of Rai Lakhmaniya's palace, when he drew his sword and commenced the attack. At this time the Rai was at his dinner, and golden and silver dishes filled with food were placed before him according to the usual custom. All of a sudden a cry was raised at the gate of his palace and in the city. Before he had ascertained what had occurred, Muhammad Bakhtiyar had rushed into the palace and put a number of men to the sword. The Rai fled barefooted by the rear of the palace, and his whole treasure, and all his wives, maid servants, attendants, and women fell into the hands of the invader. Numerous elephants were taken, and such booty was obtained by the Muhammadans as is beyond all compute. When his army arrived, the whole city was brought under subjection, and he fixed his headquarters there.

Rai Lakhmaniya went towards Sanknat and Bengal, where he died. His sons are to this day rulers in the territory of Bengal. When Muhammad Bakhtiyar had taken possession of the Rai's territory, he destroyed the city of Nudiya and established the seat of his government at Lakhnauti. He brought the surrounding places into his possession, and caused his name to be read in the Khutba and struck on the coins. Mosques, colleges, and monasteries were raised everywhere by the generous efforts of him and his officers, and he sent a great portion of the spoil to Sultan Kutbu-d din.

2. Desires to take Turkistan and Tibet, worsted in Kamrup, Minhajus Siraj[30]

When several years had elapsed, he received information about the territories of Turkistan and Tibet, to the east of Lakhnauti, and he began to entertain a desire of taking Tibet and Turkistan. For this purpose he

prepared an army of about ten thousand horse. Among the hills which lie between Tibet and the territory of Lakhnauti, there are three races of people.

The one is called Kuch (Kuch Behar), the second Mich, and the third, Tiharu. They all have Turki features and speak different languages, something between the language of Hind and that of Tibet. One of the chiefs of the tribes of Kuch and Mich, who was called Ali Mich, had been converted to Muhammadanism by Muhammad Bakhtiyar, and this man agreed to conduct him into the hills. He led him to a place where there was a city called Mardhan-kot. It is said that in the ancient times when Gurshasp Shah returned from China, he came to Kamrud (Kam-rup) and built this city. Before the town there runs a stream which is exceedingly large. It is called Bangamati [Brahmaputra]. When it enters the country of Hindustan it receives in the Hindi language the name of Samundar. In length, breadth, and depth, it is three times greater than the Ganges. Muhammad Bakh-tiyar came to the banks of this river, and Ali Mich went before the Muhammadan army. For ten days they marched on until he led them along the upper course of the river into the hills, to a place where from old times a bridge had stood over the water having about twenty (*bist o and*) arches of stone. When the army reached the bridge, Bakhtiyar posted there two officers, one a Turk, and the other a Khilji, with a large force to secure the place till his return. With the remainder of the army he then went over the bridge. The Rai of Kamrup, on receiving intelligence of the passage of the Muhammadans, sent some confidential officers to warn Bakhtiyar against invading the country of Tibet, and to assure him that he had better return and make more suitable preparations. He also added that he, the Rai of Kamrup, had determined that next year he also would muster his forces and precede the Muhammadan army to secure the country. Muhammad Bakhtiyar paid no heed to these representations, but marched on towards the hills of Tibet.

One night in the year 641 (1243A.D.) he halted at a place between Deo-kot and Bangawan, and stayed as a guest in the house of Muatamadu-d daula, who had formerly been an equerry in the service of Muhammad Bakhtiyar and had lived in the town of Lakhnauti. From this man he heard that after passing over the bridge, the road lay for fifteen stages through the defiles and passes of the mountains, and at the sixteenth stage level land was reached. The whole of that land was well populated, and the villages

were flourishing. The village which was first reached had a fort, and when the Muhammadan army made an attack upon it, the people in the fort and the surrounding places came to oppose them, and a battle ensued. The fight raged from morning till the time of afternoon prayer, and large numbers of the Muhammadans were slain and wounded. The only weapons of the enemy were bamboo spears; and their armour, shields and helmets, consisted only of raw silk strongly fastened and sewed together. They all carried long bows and arrows. When night came on, the prisoners who had been taken were brought forward and questioned, and it was then ascertained that at five parasangs from that place there was a city called Karam-batan, and in it there was about three hundred and fifty thousand brave Turks armed with bows. The moment the horsemen of the Muhammadans arrived, messengers went to report their approach, and these messengers would reach their destination next morning. When the author was at Lakhnauti, he made enquiries about that place, and learnt that it was a pretty large city. The ramparts of it are built of stone. The inhabitants of it are Brahmans and Nunis, and the city is under the sway of the chief of these people. They profess the Buddhist religion. Every morning in the market of that city, about fifteen hundred horses are sold. All the saddle horses which come into the territory of Lakhnauti are brought from that country. Their roads pass through the ravines of the mountains, as is quite common in that part of the country. Between Kamrup and Tibet there are thirty-five mountain passes through which horses are brought to Lakhnauti.

In short, when Muhammad Bakhtiyar became aware of the nature of the country, and saw that his men were tired and exhausted, and that many had been slain and disabled in the first day's march, he consulted with his nobles, and they resolved that it was advisable to retreat, that in the following year they might return to the country in a state of greater preparation. On their way back there was not left on all the road a single blade of grass or a bit of wood. All had been set on fire and burnt. The inhabitants of the valleys and passes had all removed far away from the road, and for the space of fifteen days not a sir of food nor a blade of grass or fodder was to be found, and they were compelled to kill and eat their horses.

When, after descending the hill of the land of Kamrup, they reached the bridge, they found that the arches of it had been demolished. The two

officers who had been left to guard it had quarreled, and in their animosity to each other had neglected to take care of the bridge and the road, so the Hindus of Kamrup had come there and destroyed the bridge. When Muhammad Bakhtiyar with his army reached the place, he found no means of crossing. Neither was there a boat to be found, so he was greatly troubled and perplexed. They resolved to fix on some place where to encamp, and prepare rafts and boats to enable them to cross the river.

In the vicinity of this place was perceived a temple, very lofty and strong, and of beautiful structure. In it there were numerous idols of gold and silver, and one very large golden idol, which exceeded two or three thousand miskals in weight. Muhammad Bakhtiyar and the remnant of his army sought refuge in that temple, and set about procuring wood and ropes for constructing rafts to cross the stream. The Rai of Kamrup was informed of the distress and weakness of the Muhammadans, and he issued orders to all the Hindus of his territory to come up, levy after levy, and all around the temple they were to stick their bamboo spears in the ground and to plait them together so as to form a kind of wall. Then the soldiers of Islam saw this they told Muhammad Bakhtiyar that if they remained passive they would all be taken in the trap of the infidels and be made prisoners; some way of escape must be sought out. By common consent they made a simultaneous sally, and directing their efforts to one spot, they cleared for themselves a way through the dangerous obstacle to the open ground. The Hindus pursued them to the banks of the river and halted there. Every one exerted his ingenuity to devise some means of passing over the river. One of the soldiers urged his horse into the water, and it was found fordable to the distance of a bow-shot. A cry arose in the army that a fordable passage was found, and all threw themselves into the stream. The Hindus in their rear took possession of the banks. When the Muhammadans reached the middle of the stream, the water was found to be very deep, and they nearly all perished. Muhammad Bakhtiyar with some horse, to the number of about a hundred, more or less, crossed the river with the greatest difficulty, but all the rest were drowned….

I. Timur in India

1. Motives of the expedition to Hindustan[31]

About this time there arose in my heart the desire to lead an expedition against the infidels, and to become a *ghazi* for it had reached my ears that the slayer of infidels is a *ghazi,* and if he is slain he becomes a martyr…

My great officers told me that the inhabitants of Hindustan were infidels and unbelievers. In obedience to the order of Almighty God I determined on an expedition against them, and I issued orders to the *amirs* of mature years, and the leaders in war, to come before me, and when they had come together I questioned the assembly as to whether I should invade Hindustan or China, and said to them, "By the order of God and the Prophet it is incumbent upon me to make war upon these infidels and polytheists."…

My *wazirs* informed me that the whole amount of the revenue of India is six *arbs;* now each *arb* is a *100 krors,* and each *kror* is 100 *lacs,* and each *lac* is a 100,000 *miskals* of silver. Some of the nobles said, "By the favour of Almighty God we may conquer India, but if we establish ourselves permanently therein, our race will degenerate and our children will become like the natives of those regions, and in a few generations their strength and valour will diminish." The *amirs* of regiments (*kushunat*) were disturbed at these words, but I said to them, "My object in the invasion of Hindustan is to lead an expedition against the infidels that, according to the law of Muhammad (upon whom and his family be the blessing and peace of God), we may convert to the true faith the people of that country, and purify the land itself from the filth of infidelity and polytheism; and that we may overthrow their temples and idols and become *ghazis* and *mujahids* before God."…

2. Account of the holy war against the infidel Kators and the Siyah-poshes[32]

The kingdom of Kator

When I made enquiries concerning the extent and condition of that kingdom from Muzid, who was the chief man of Indarab, he informed me that the length of the kingdom of Kator stretches from the frontier of Kashmir to the mountains of Kabul, and there are many towns and villages in this country. One of their large cities is called Shokal, and another Jorkal, which latter is the residence of their ruler. The country produces fruits in large quantities, such as grapes, apples, apricots, and various other kinds. Rice and other grains are cultivated. Much wine is made, and all people,

great and small, drink of it. The people eat swine's flesh. Cattle and sheep abound in this country. Most of the inhabitants are idolaters; they are men of a powerful frame and fair complexion. Their language is distinct from Turki, Persian, Hindi, and Kashmiri. Their weapons are arrows, swords, and slings. Their ruler is called Adalshu.

When I arrived at Khawak I perceived a dilapidated fort which I resolved to repair, so I immediately gave orders to the soldiers to that effect, and it was speedily executed. As most of the route was rocky and precipitous, I ordered most of the nobles and all the soldiers to leave horses, camels, and superfluous baggage in this fort. In obedience to this order most of the nobles and all the soldiers accompanied me on foot, while I, relying on the assistance of Almighty God, pressed steadily forward to the conquest of Kator and began to ascend the mountains. In spite of the heat of the wind there was so much snow on the hills that the feet of both men and cattle helplessly sank in it. I was therefore obliged to halt during the day, but at night when the snow congealed I pursued my way over the frozen surface of the ice till I reached the top of the mountain. At daybreak, when the ice thawed, carpets and horse-rugs were spread upon its surface and the horses were kept upon them. At nightfall we again went on as before, and in this manner I crossed several lofty mountains, but the nobles were obliged to send back to the fort several of the horses they had brought with them. When I reached the top of a lofty mountain, such that there can be none higher than it, I found that these wicked infidels had taken up their position in the caverns of the mountain, the entrances of which were blocked up with snow, so that they were almost inaccessible, nor, in spite of all my exertions, could I find a way to descend the mountain….

The ruler of Kator had a fort, on one side of which was a river, and beyond the river a lofty mountain reaching down to the water. As the infidels in this fort had gained intelligence of my approach a day before my arrival, and dread had taken possession of their hearts, they had removed their wealth and property from the fort, and having crossed the river, had taken refuge in the mountain which was very lofty, and abounded in caves very difficult of access. On its being represented to me that this fort was the most important stronghold of the ruler of Kator in those parts, I resolved to subdue it. When I advanced into the neighbourhood of the fort I did not perceive a trace of the infidels, and when I came to the place itself I saw

that they had abandoned it and fled. I obtained a booty of many sheep and some other things here, and ordered that they should set fire to the houses and buildings of the city, in the midst of which the fort was built, and that they should level it with the ground. Then crossing the river in haste and pursuing the track of the enemy, I reached the skirts of the mountain on the top of which the infidels had taken up their position in defiles and other strong places. I immediately gave orders to my valiant and experienced troops to ascend. Raising their war cry and shouting the *takbir,* they rushed to the attack, and before all the rest Shaikh Arslan Aztuman Kabak Khan, who is a lion in the day of battle, mounting the hill on the left hand, commenced the fight. Leading his men upon the infidels he put them to fight, and following up the enemy entered the fastnesses of the rock and sent numbers of the impious unbelievers to hell. Tawachi Ali Sultan, also on his side, made a valiant assault upon the foe, and with his own regiment charged and routed the infidel enemy, sending numbers of them to hell. Amir Shah Malik too, on his side, displayed great valour, making a great slaughter of the infidels and driving them completely out of the mountain. Mubashir Bahadur and Mankali Khwajah, and Sunjak Bahadur, and Shaikh Ali Sa1ar, and Musa Zakmal, and Husain Malik Kuchin, and Mir Husain Kur, and the other nobles, displayed great valour and used their swords well. They all proved their zeal for Islam on the unbelieving foe, and having overpowered the infidels they put many of them to death, and took possession of their fastnesses. Only a few of the enemy succeeded in sheltering themselves, wounded and worn out with fatigue, in their caverns. of my troops only fourteen persons lost their lives, and that was in effecting the passage of the mountain. Some of the infidels held out in their defiles for three days and nights, but sending my valiant troops against them I so pressed them that they were obliged to surrender and call for quarter. I sent Ak Sultan to them with the message that if they would consent to submit unconditionally and would all become Musulmans and repeat the creed, I would grant them quarter, but otherwise I would exterminate them to a man. When Ak Sultan reached the infidels with this message, which he explained to them through the medium of an interpreter conversant both with their language and with Turki, they all proffered submission, and repeating the necessary formula, embraced the Muhammadan faith. Relying upon this external profession I spared their lives and property, and gave orders that no

one should interfere with their lives, wealth, or country. I then clothed some of them in dresses of honour and dismissed them. I halted with my army there for that night, and these black-hearted infidels made a nocturnal assault on the regiment of Amir Shah Malik, but as this leader was on his guard, the enemy were foiled in their intentions. Numbers of them were slain, and 150 fell into our hands alive, who were afterwards put to death by my enraged soldiery. As soon as it was day I ordered my troops to attack on all four sides at once, and forcing their way into the defiles to kill all the men, to make prisoners the women and children, and to plunder and lay waste all their property. In obedience to these orders, my nobles and troops making a valiant assault on all sides at once, and putting to the sword the remnant of the infidels, consigned them to the house of perdition. They made prisoners of their women and children, and secured an enormous booty. I directed towers to be built on the mountain of the skulls of those obstinate unbelievers, and I ordered an engraver on stone, who was in my camp, to cut an inscription somewhere on those defiles to the effect that I had reached this country by such and such a route, in the auspicious month of Rama-zan, A. H. 800 (May, 1398): that if chance should conduct anyone to this spot he might know how I had reached it….

3. The annihilation of Nusrat [Jasrath] Khokhar[33]

It was represented to me that in this country there was a certain *zamindar,* by name Nusrat, of the tribe of Khokhar, who, having established himself with two thousand bloodthirsty soldiers in a fortress on the bank of a lake, breathed out defiance and rebellion…I immediately marched to attack this Nusrat Khokhar…

When I arrived at the heavy swampy ground on the bank of the lake, where the God-forsaken Nusrat had taken up his position, I found that he was there with his two thousand men drawn up all ready to receive me… Nusrat himself fell among the slain, but it was not known how he had been killed, or whether he effected his escape. My victorious troops entered and set fire to the residence of Nusrat Khokhar, and having plundered the wealth and property of those Indians and taking an immense booty of' flocks, herds, buffaloes, etc., returned to my presence.

4. Conquest of the town of Sarsuti[34]

When I made inquiries about the city of Sarsuti, I was informed that the people of the place were strangers to the religion of Islam, and that they kept hogs in their houses and ate the flesh of those animals. When they heard of my arrival, they abandoned their city. I sent my cavalry in pursuit of them, and a great fight ensued. All these infidel Hindus were slain, their wives and children were made prisoners, and their property and goods became the spoil of the victors. The soldiers then returned, bringing with them several thousand Hindu women and children who became Muhammadans, and repeated the creed. of all the braves who took part in this action, Adil Bahadur Farrash was the only one who fell…

5. Preparations for the conquest of Dehli[35]

Massacre of 100,000 Hindus

I now held a Court…

At this Court Amir Jahan Shah and Amir Sulaiman Shah and other *amirs* of experience, brought to my notice that from the time of entering Hindustan up to the present time, we had taken more than 100,000 infidels and Hindus prisoners, and that they were all in my camp. On the previous day, when the enemy's forces made the attack upon us, the prisoners made signs of rejoicing, uttered imprecations against us, and were ready, as soon as they heard of the enemy's success, to form themselves into a body, break their bonds, plunder our tents, and then to go and join the enemy, and so increase his numbers and strength. I asked their advice about the prisoners, and they said that on the great day of battle these 100,000 prisoners could not be left with the baggage, and that it would be entirely opposed to the rules of war to set these idolaters and foes of Islam at liberty. In fact, no other course remained but that of making them all food for the sword. When I heard these words I found them in accordance with the rules of war, and I directly gave my command for the *Tawachis* to proclaim throughout the camp that every man who had infidel prisoners was to put them to death, and whoever neglected to do so should himself be executed and his property given to the informer. When this order became known to the *ghazis* of Islam, they drew their swords and put their prisoners to death. 100,000 infidels, impious idolaters, were on that day slain. Maulana Nasiru-d din 'Umar, a counsellor and man of learning, who, in all his life, had

never killed a sparrow, now, in execution of my order, slew with his sword fifteen idolatrous Hindus, who were his captives…

War strategy

I did not wish the war to be of long continuance; so as soon as night was over and morning came, I arose to my devotions. I said the morning prayers in the congregation, and I repeated my private prayers, then I took the holy book, which I always carried with me, and sought a *fal* on the subject of the war. The verse which appeared was one in the CHAPTER — of the Bee. I immediately sought the interpretation of this verse from those who were present, and they replied that the manifest meaning of it was...I received this *fal* as a propitious indication, and acted in full reliance on its command and on the favour of God.…

6. Defeat of Sultan Mahmud of Dehli[36]

The whole of Sultan Mahmud's [the Tughlaq ruler of Delhi] army was defeated; part was slain, and part had found refuge in the fort, and I, exalted with victory, marched towards the fort. When I reached its gates I carefully reconnoitred its towers and walls, and then returned to the side of the *Hauz-i khass...* When I had pitched my camp here, the princes and *amirs* and *nuyans,* and all the generals and officers, came to wait upon me to pay their respects and offer their congratulations on this great victory.…

I mounted my horse and rode towards the gate of the *maidan.* I alighted at the *'id-gah,* a lofty and extensive building, and I gave orders for my quarters to be moved there, and for my throne to be set up in the *id-gah.* I took my seat upon the throne and held a Court. The *saiyids,* the *kazis,* the *'ulama* (learned Musulmans), the *shaikhs,* and the great men and chiefs of the (Muhammadans of the) city assembled and came out to attend my Court. I had them introduced one by one, and they made their obeisances and were admitted to the honour of kissing my throne. I received every one of them with respect and kindness, and directed them to be seated. Fazlu-llah Balkhi was *vakil* and *naib* of Mallu Khan, and he came out to wait upon me and do homage, accompanied by a party of the officials and clerks of the government of Sultan Mahmud and Mallu Khan. Hereupon all the *saiyids, 'ulama, shaikhs,* and other leading Musulmans arose, and, making the princes their mediators, they begged that quarter might be given to the people of Dehli, and that their lives might be spared. Out of respect to the

saiyids and *ulama,* whom I had always held in great esteem and honour, I granted quarter to the inhabitants of the city. I then ordered my ensign *(tauk)* and royal standard to be raised, and the drums to be beaten and music played on the tops of the gates of Dehli. Rejoicings for the victory followed. Some of the clever men and poets that accompanied me worked the date of the victory into a verse, which they presented to me. of all these memorial verses I have introduced (only) this one into my memoirs- —

'On Wednesday, the eighth of Rabi' the second (17th Dec., 1398), The Emperor Sahib-Kiran took the city of Dehli, etc., etc.

I rewarded and honourably distinguished the literary men and poets who presented these verses to me…

When Friday came, I sent Maulana Nasiru-d din 'Umar, with some other holy and learned men that accompanied my camp to the *masjid-i jami,* with directions to say the prayers for the Sabbath, and to repeat the *khutba* of my reign in the metropolis of Dehli. Accordingly, the *khutba,* with my name, was repeated in the pulpits of the mosques in the city of Dehli, and I rewarded the preachers with costly robes and presents….

7. Sack of Dehli[37]

On the 16th of the month some incidents occurred which led to the sack of the city of Dehli, and to the slaughter of many of the infidel inhabitants. One was this. A party of fierce Turk soldiers had assembled at one of the gates of the city to look about them and enjoy themselves, and some of them laid violent hands upon the goods of the inhabitants. When I heard of this violence I sent some *amirs,* who were present in the city, to restrain the Turks. A party of soldiers accompanied these *amirs* into the city. Another reason was that some of the ladies of my harem expressed a wish to go into the city and see the palace of *Hazar-sutun* (thousand columns) which Malik Jauna built in the fort called Jahan-panah. I granted this request, and I sent a party of soldiers to escort the litters of the ladies. Another reason was that Jalal Islam and other *diwans* had gone into that city with a party of soldiers to collect the contribution laid upon the city. Another reason was that some thousand troopers with orders for grain, oil, sugar, and flour, had gone into the city to collect these supplies. Another reason was that it had come to my knowledge that great numbers of Hindus and *gabrs,* with their wives and children, and goods, and valuables, had come into the city from all the

country round, and consequently I had sent some *amirs* with their regiments *(kushun)* into the city and directed them to pay no attention to the remonstrances of the inhabitants, but to seize and bring out these fugitives. For these several reasons a great number of fierce Turki soldiers were in the city. When the soldiers proceeded to apprehend the Hindus and *gabrs* who had fled to the city, many of them drew their swords and offered resistance. The flames of strife were thus lighted and spread through the whole city from Jahanpanah and Siri to old Dehli, burning up all it reached. The savage Turks fell to killing and plundering. The Hindus set fire to their houses with their own hands, burned their wives and children in them, and rushed into the fight and were killed. The Hindus and *gabrs* of the city showed much alacrity and boldness in fighting. The *amirs* who were in charge of the gates prevented any more soldiers from going into the place, but the flames of war had risen too high for this precaution to be of any avail in extinguishing them. On that day, Thursday, and all the night of Friday, nearly 15,000 Turks were engaged in slaying, plundering, and destroying. When morning broke on the Friday, all my army, no longer under control, went off to the city and thought of nothing but killing, plundering, and making prisoners. All that day the sack was general. The following day, Saturday, the 17th, all passed in the same way, and the spoil was so great that each man secured from fifty to a hundred prisoners, men, women, and children. There was no man who took less than twenty. The other booty was immense in rubies, diamonds, garnets, pearls, and other gems; jewels of gold and silver; *ashrafis, tankas* of gold and silver of the celebrated 'Alai coinage; vessels of gold and silver; and brocades and silks of great value. Gold and silver ornaments of the Hindu women were obtained in such quantities as to exceed all account. Excepting the quarter of the *saiyids,* the *ulama,* and the other Musulmans, the whole city was sacked. The pen of fate had written down this destiny for the people of this city. Although I was desirous of sparing them I could not succeed, for it was the will of God that this calamity should fall upon the city.

On the following day, Sunday, it was brought to my knowledge that a great number of infidel Hindus had assembled in the *masjid-i jami* of Old Dehli, carrying with them arms and provisions, and were preparing to defend themselves. Some of my people who had gone that way on business were wounded by them. I immediately ordered Amir Shah Malik and Ali

Sultan Tawachi to take a party of men and proceed to clear the house of God from infidels and idolaters. They accordingly attacked these infidels and put them to death. Old Dehli then was plundered…

By the will of God, and by no wish or direction of mine, all the three cities of Dehli, by name Siri, Jahanpanah, and Old Dehli, had been plundered. The *khutba* of my sovereignty, which is an assurance of safety and protection, had been read in the city. It was therefore my earnest wish that no evil might happen to the people of the place. But it was ordained by God that the city should be ruined. He therefore inspired the infidel inhabitants with a spirit of resistance, that they brought on themselves that fate which was inevitable…

8. Campaign against the infidels after sack of Dehli[38]

I had been at Dehli fifteen days, which time I had passed in pleasure and enjoyment, holding royal Courts and giving great feasts. I then reflected that I had come to Hindustan to war against infidels, and my enterprise had been so blessed that wherever I had gone I had been victorious. I had triumphed over my adversaries, I had put to death some *lacs* of infidels and idolaters, and I had stained my proselyting sword with the blood of the enemies of the faith. Now this crowning victory had been won, and I felt that I ought not to indulge in ease, but rather to exert myself in warring against the infidels of Hindustan.…

THREE VICTORIES IN ONE DAY

Hardwar

…some of the reconnoitring party came in with the information that there was a large number of Hindus assembled in the valley of Kutila [Kupila, Hardwar?] on the side of the Ganges, having made that valley a place of refuge. I instantly mounted, and leaving the greater part *(tamami)* of my force to secure the spoil, I started off for the valley of Kutila with only five hundred horsemen. When I reached the place I found an immense number of *gabrs* assembled in the *darra.* Instantly I ordered Amir Shah Malik and Ali Sultan Tawachi to charge the enemy without paying the slightest heed to their numbers, although they were twenty to one. Spurring their horses, shouting their war-cry, and brandishing their swords, they fell upon the forces (*afwaj*) of the enemy like hungry lions upon a flock of sheep. At the

first charge the ranks of the enemy were broken, and many of their men fell under the blows of the sword. God thus gave me victory with such a small band of followers over such a numerous host of the enemy. After many of them had been slain, those who escaped kept in the thickets and defiles *(darraha),* skulking like foxes and jackals. An immense booty was left, and my braves were busy in securing it…

Again I mounted my steed; and as I did so intelligence was brought to me that in the valley *(darra)* of Kutila, two *kos* distant, a large number of infidels and *gabrs* had collected with their wives and children, and with property, goods, and cattle beyond all estimate. The road thither was arduous, through jungles and thickets. When I heard this my first thought was that I had been awake since midnight, I had travelled a long distance without any halt, and had surmounted many difficulties, I had won two splendid victories with a few brave soldiers, and I was very tired, I would therefore stop and take rest. But then I remembered that I had drawn my sword, and had come to Hind with the resolution of waging a holy war against its infidels, and so long as it was possible to fight with them, rest was unlawful for me. Although I had only a few *amirs* and a few soldiers with me, I placed my trust in God, and determined to attack the enemy…

Pressing on with all haste I passed the jungles and thickets, and arrived in front of the infidels. After a slight resistance the enemy took to flight, but many of them fell under the swords of my soldiers.

All the wives and children of the infidels were made prisoners, and their property and goods, gold, money and grain, horses, camels *(shutur),* cows and buffalos in countless numbers, fell as spoil into the hands of my soldiers. Satisfied with this rout of the enemy, I said the afternoon prayers in public in that desert, and I returned thanks to God for that I had fought three times with enemies outnumbering my men by ten and twenty to one, and in each battle I had gained a signal victory.

Source of the Ganges

…information was brought to me that fifteen *kos* off, up the river, and near the mountains, there was a place in which there was the image of a cow, carved out of stone, and that the river *(ab)* ran from its mouth. In the belief of the people of Hindustan the source of the river Ganges was in this same mountain. The Hindu infidels worship the Ganges, and once every

year they come on to this place [Hardwar], which they consider the source of the river, to bathe and to have their heads and beards shaved. They believe these acts to be the means of obtaining salvation and securing future reward. They dispense large sums in charity among those who wear the brahmanical thread, and they throw money into the river. When infidels die in distant parts, their bodies are burned, and the ashes are brought to this river and are thrown into it. This they look upon as a means of sanctification. When I learned these facts, I resolved to war against the infidels of this place, so that I might obtain the merit of overthrowing them…

At dawn on the 5th Jumada-l awwal I said my morning prayer, and started with a suitable force for the valley of Kutita, which lies at the foot of a lofty mountain and on the banks of the Ganges. During the night all the *gabrs* who had been scattered reassembled under their chiefs, and as they had no place of refuge more secure, they resolved that if the Musulmans returned, they would fight till they died. So they were prepared for battle...My brave men displayed great courage and daring; they made their swords their banners, and exerted themselves in slaying the foe. They slaughtered many of the infidels, and pursued those who fled to the mountains. So many of them were killed that their blood ran down the mountains and the plain, and thus (nearly) all were sent to hell. The few who escaped, wounded, weary, and half dead, sought refuge in the defiles of the hills. Their property and goods, which exceeded all computation, and their countless cows and buffalos, fell as spoil into the hands of my victorious soldiers.

When I was satisfied with the destruction I had dealt out to the infidels, and the land was cleansed from the pollution of their existence, I turned back victorious and triumphant, laden with spoil. On that same day I crossed the Ganges, and said my mid-day prayers in the congregation, on the bank of that river. I prostrated myself in humble thanks to God, and afterwards again mounting my horse, marched five miles down the river and then encamped. It now occurred to my mind that I had marched as a conqueror from the river Sind to Dehli, the capital of the kings of India. I had put the infidels to the edge of the sword on both sides of my route, and had scoured the land; I had seized upon the throne of the kings of India; I had defeated Sultan Mahmud, the king of Dehli, and triumphed over him; I had crossed the rivers Ganges and Jumna, and I had sent many of the

abominable infidels to hell, and had purified the land from their foul existence. I rendered thanks to Almighty God that I had accomplished my undertaking, and had waged against the infidels that holy war I had resolved upon: then I determined to turn my course towards Samarkand, my capital and paradise…

2. Gonzalez de Clavijo, who did not visit India, collected information on the country during his stay in the court of Timur in the years 1403-1406 from informants, including a grandson of Timur who had just returned from India. His account is contrary to the boastful narrative of Timur[39]

The chief city of India is called Delhi and here Timour Beg fought a battle with the lord of India. The Indian collected a great force, and had fifty armed elephants; and in the first battle the lord of India defeated Timour Beg, by means of his elephants. On the following day they renewed the contest, and Timour took many camels, and loaded them with dry grass, placing them in front of the elephants. When the battle began, he caused the grass to be set on fire and when the elephants saw the burning straw upon the camels, they fled. They say that the elephants are much afraid of fire, because they have small eyes; and thus the lord of India was defeated.

Timour Beg conquered all the plain country from this lord, which bordered on the empire of Samarcand; but most of the land is rugged and mountainous. They say that there are many great towns and cities, and that the country is very rich and populous. When the lord of India was defeated, he fled to the mountains, and collected another force, but he did not venture to attack his enemy. The plain country which was then conquered, is governed by this grandson of Timour Beg from the great and rich city of Hormes; but the greater part of India is still held by the former lord. This battle took place about twelve years ago, and since that time, neither Timour Beg, nor his grandson have attempted to advance further into India.

.

CHAPTER — 12

Muslim Rulers

A. The Sultans of Delhi
B. Sultan of Bedar
C. Sultan of Padua

A. The Sultans of Delhi

1. Qutbuddin Aibak, Minhaju-s Siraj[1]

When Sultan-i Ghazi Muhammad Sam died, Sultan Ghiyasu-d din Mahmud Muhammad Sam, his nephew, gave Kutbu-d din the royal canopy, and the title of Sultan...in the year 607 H. the Sultan fell from his horse in the field while he was playing chaugan, and the horse came down upon him, so that the pommel of the saddle entered his chest, and killed him. The period of his government, from his first conquest of Dehli up to this time, was twenty years, and the time of his reign, during which he wore the crown, and had the Khutba read and coin struck in his name, was something more than four years.

2. Sultan Iltutmish, Minhaju-s Siraj[2]

After he had reached the capital he sent, in A.H. 632 (1234 A.D.), the army of Islam towards Malwa and took the fort and city of Bhilsa. There was a temple there which was three hundred years in building. It was about one hundred and five *gaz* high. He demolished it. From thence he proceeded to Ujjain, where there was a temple of Maha-kal, which he destroyed.

3. Sultan Ruknu-d din Firoz Shah, Minhaju-s Siraj[3]

Sultan Ruknu-d din Firoz Shah was a generous and handsome king, full of kindness and humanity. In liberality he was a second Hatim. His mother, the queen of the world, Shah Turkan, was originally a Turki handmaid, but had become the chief wife of Sultan Shamsu-d din Altamsh. She lavished many offerings and much charity on learned men, *saiyids,* and devotees…

On the death of Sultan Shamsu-d din Altamsh, the princes and nobles placed Ruknu-d din upon the throne on Tuesday, 29th of Sha'ban 633 H. (beginning of May, 1236), and the crown and throne were graced by his

accession. The nobles were gratified and received robes of honour. When they returned home from the capital, the new monarch opened the doors of his treasury and gave himself up to pleasure, squandering the public wealth in improper places. So devoted was he to licentiousness and debauchery that the business of the State was neglected and fell into confusion.

His mother, Shah Turkan, began to interfere in the government of the country. During the life of her husband his other women had looked upon her with envy and disdain. She now seized the opportunity of punishing them, and in blind fury and vindictiveness she put several of them to death. This state of things began to trouble the minds of public men. In addition to her other cruel acts she caused the young prince Kutbu-d din, son of the late king, and a very excellent youth, to be blinded and afterwards to be put to death. These acts aroused an inimical feeling in the hearts of the great men in all direction….

When Ruknu-d din arrived at Kilu-ghari he found that rebellion had broken out, and that his mother had been made prisoner. The guards and Turkish nobles came into the city, and joining Raziya, proffered their allegiance to her, and raised her to the throne, Being thus elevated to the throne, she sent an army of Turks and nobles to Kilu-ghari and they brought Sultan Ruknu-d din prisoner to Dehli, where he was kept in confinement and died. His death happened on Sunday, the 18th of Rabi'u-l awwal A.H. 634 (November, 1236 A.D.) He reigned for six months and twenty-eight days. He was very generous; no king in any reign had ever scattered gifts, robes of honour, and grants in the way he did, but all his lavishness sprang from his inordinate addiction to sensuality, pleasure, and conviviality. He was so entirely devoted to riot and debauchery, that he often bestowed his honours and rewards on bands of singers, buffoons, and catamites.

4. Sultan Raziya, Minhaju-s Siraj[4]

Sultan Raziya was a great monarch. She was wise, just, and generous, a benefactor to her kingdom, a dispenser of justice, the protector of her subjects, and the leader of her armies. She was endowed with all the qualities befitting a king, but she was not born of the right sex, and so in the estimation of men all these virtues were worthless. (May God have mercy on her!)

5. Sultan-i Mu'azzam Nasiru-d dunya wau-d din Mahmud, Minhaju-s Siraj[5]

Sultan-i Mu'azzam Nasiru-d dunya wau-d din ascended the throne in the Green Palace at Delhi with the most favourable auspices on Sunday, 23rd Muharram 644 H. (10th June, 1246)…Ulugh Khan-I Azam, who now held the office of lord chamberlain, ...with the help of God, ravaged the hills of Jud and the Jailam, and sent many of the Kokhars (Gakkars) and rebellious infidels to hell…

In the neighbourhood of Kanauj there is a fortified village called Nandana, where there is a very strong fort vying with the wall of Alexander. A body of infidel Hindus shut themselves up in this place, resolved to fight to the extremity. For two days the royal army carried on a murderous conflict at this village, but at length the rebels were sent to hell, and the place subdued…

There was in the neighbourhood a Rana who (*ora*) was called Dalaki wa Malaki. He had many dependants, countless fighting men, great dominion and wealth, fortified places, and hills and defiles extremely difficult of access. All these he (Ulugh Khan) ravaged. He took prisoners the wives, sons, and dependants of that accursed one, and secured great booty…

…His Majesty…advanced as far as Malwa. Jahir Deo was the greatest of all the Ranas of that country and neighbourhood. He had five thousand horse and two hundred thousand infantry, but he was defeated…Ulugh exhibited great energy in this campaign…

On the 16th Ramazan Ulugh Khan was sent into the hills of Delhi, to chastise the rebel inhabitants of Mewat, and to intimidate their Deo. Ten thousand horsemen in armour, and a large army of brave and warlike soldiers were under his command. Great booty was gained, and many cattle captured. Defiles and passes were cleared, strong forts were taken, and numberless Hindus perished under the merciless swords of the soldiers of Islam…

6. Ghiyasu-d din Balban

(a) Of Turkish stock, Minhaju-s Siraj[6]

The Khakan-I Muazzam Ulugh Khan-I Azam belonged to the stock of the Khakans of Albari…The Almighty desired to grant a support to the power of Islam and to the strength of the Muhammadan faith, to extend his

glorious shadow over it, and to preserve Hindustan within the range of his favour and protection. He therefore removed Ulugh Khan in his youth from Turkistan, and separated him from his race and kindred, from his tribe and relations, and conveyed him to the country (of Hindustan), for the purpose of curbing the Mughals [Mongols]…

(b) Campaigns in the Jud hills, Minhaju-s Siraj[7]

On Monday, the 1st Rajab, 644 H., the army set forth and proceeded to the river Sodra. Here Ulugh Khan was detached with several nobles and generals to make an incursion into the hills of Jud. The Rana of these hills had acted as guide to the infidel Mughals, and it was now determined to take vengeance. Ulugh Khan accordingly attacked the hills of Jud, and the countries on the Jailam, and led his forces as far as the banks of the Indus. All the women and dependants of the infidels which were in those parts were obliged to flee, and a party of the Mughal army crossed over the Jailam, and saw the forces which were arrayed under the command of Ulugh Khan. The manifold lines of the army, the numbers of the horse, the armour and the arms, filled the observers with wonder and dismay. The bravery and generalship which Ulugh Khan displayed in scaling the mountains, breaking through defiles, capturing fortified places, and crossing jungles, cannot be described in writing. The fame of this campaign extended to Turkistan…

The perseverance and resolution of Ulugh Khan had been the means of showing to the army of Turkistan and the Mughals such bravery and generalship that in the course of this year no one came from the upper parts towards Sindh…

(c) Turkish monopoly of power, Minhaju-s Siraj[8]

The nobles and servants of the State were all Turks of pure origin and Taziks of good stock, but Imadu-d din [an Indian convert] was an eunuch and impotent; he, moreover, belonged to one of the tribe of Hindustan. Notwithstanding all this he exercised authority over the heads of all these chiefs. They were disgusted with this state of affairs and could no longer endure it…

(d) Campaigns against the infidels, Minhaju-s Siraj[9]

At the beginning of 658 H. (December, 1259), Ulugh Khan resolved upon a campaign in the hills near the capital. These hills were inhabited by a

turbulent people, who committed depredations on the roads, plundered the goods of Musulmans, drove away the cultivators, and ravaged the villages in the districts of Harriana, the Siwalik hills, and Bayana. Three years before they had carried off from Hansi a drove of camels and a number of the people of Ulugh Khan. Their chief was a Hindu named Malka, a fierce and desperate fellow. It was he who carried off the camels, and he fomented disturbances among the Hindus from the hills to Rantambhor. But when he did these things the army was otherwise engaged…in repelling the Mughal forces, which had attacked the frontiers of Islam in Sindh, at Lahore, and in the vicinity of the river Biyah….

Ulugh Khan and other nobles...resolved upon a campaign in the hills, and made the first march in advance on Monday, 4th Safar, 658. In their first forced march (*kashish*) they accomplished nearly fifty *kos*, and fell unexpectedly upon the rebels. These retreated to the summits of the mountains, to the defiles, to deep gorges and narrow valleys, but they were all taken and put to the sword. For twenty days the troops traversed the hills in all directions. The villages and habitations of the mountaineers were on the summits of the loftiest hills and rocks, and were of great strength, but they were all taken and ravaged by order of Ulugh Khan…A silver *tanka* was offered for every head, and two *tankas* for every man brought in alive. Eager for these rewards the soldiers climbed the highest hills, and penetrated the ravines and deepest gorges, and brought in heads and captives…Fortune now so favoured Ulugh Khan that he was able to penetrate to a fastness which no Musulman army had ever reached…

In the course of twenty days this great work was accomplished, and the army returned to the capital on the 24th Rabi'u-l, 658. His Majesty, with a great retinue of chiefs and nobles, came forth to the plain of Hauz-rani to meet him, and a grand Court was held in which many honours and rewards were bestowed. After a stay of two days in the capital the Court went forth again to Hauz-rani on a mission of revenge. The elephants were prepared, and the Turks made ready their trenchant swords. By royal command many of the rebels were cast under the feet of elephants, and the fierce Turks cut the bodies of the Hindus in two. About a hundred met their death at the hands of the flayers, being skinned from head to foot; their skins were all stuffed with straw, and some of them were hung over every gate of the city. The plain of Hauz-rani and the gates of Delhi remembered no punishment like this, nor had any one heard such a tale of horror…

The last event which I have to record is this. When Ulugh Khan carried war into the hills, and punished the rebels in the way we have related, a number of them escaped by flight. They now again took to plundering on the highways, and murdering Musulmans, so that the roads became dangerous. This being reported to the Khan, he sent emissaries and spies to find out the places where the rebels had taken refuge, and to make a full report of their state and condition. On Monday, 24th Rajab, 658 (July, 1260), he marched from Delhi with his own forces, the main army, and the forces of several chiefs. He hastened towards the hills, and, accomplishing more than fifty *kos* in one day's journey (!), he fell upon the insurgents unawares, and captured them all, to the number of twelve thousand – men, women, and children – whom he put to the sword. All their valleys and strongholds were overrun and cleared, and great booty captured. Thanks be to God for this victory of Islam.

7. Alauddin Khalji

(a) Alauddin and the Mongol invasions, Abdu-llah Wassaf[10]

When Sultan 'Alau-d din had fully established himself in the empire of Dehli, and his conquests and holy wars had proclaimed him universally as the greatest champion of the Muhammadan religion, it happened, that in the year 708, Ali Beg Gurgan, with an army consisting of three tumans, marched to Hindustan, and pitched his camp in the vicinity of 'Iwaz (Oudh) and Badaun, expecting to make an easy conquest of that country. The Sultan dispatched his general Hazar-Dinari, who was called Malik Kafur, with 80,000 formidable and veteran cavalry to expel them; and when the army of Islam was within the distance of a day's journey from the enemy, it made suddenly a night attack on their camp, which was left quite unguarded, and the greater part of the Mughal armies received their retribution *(iwaz)* from the empire of Dehli, where they met with the silent tomb of entire annihilation. Having surrounded the remnant on the field of battle they deprived them of their arms," and 'Ali Beg and other officers of the Mughals were carried captive to Dehli.

"Sultan 'Alau-d din gave orders that the sword of menace and the declaration of unity should be offered to them; when, as they could not help themselves, they placed their heads on the line of Islam," and repeated the profession of the Muhammadan creed…. "Alau-d din honoured and gave

preferment to Ali Beg, and made him one of his nobles, and the Mughal army was provided for amongst the armies of Islam. After the battle an order was issued by Alau-d din to gather together the heads of those who had been slain. This matter was specially made over to the Hindus. On counting them after they were thrown at the feet of the holy warrior they were found to amount to 60,000, and, as was done with the Nigudari [a younger son of the Mongol invader, Chagatai] Mughals, a pillar was constructed of these heads before the Badaun gate, in order that it might be a warning and spectacle to future generations.

(b) Invasion of Telingana, Abdu-llah, Wassaf[11]

In the year 709 (1309 A.D.), – the year arrived in prosperity and the time was propitious – the lofty mind of the king greatly inclined towards the conquest of the whole of Hindustan, and the subjection of the infidels. Previous to this, Malwa had been conquered; he, therefore dispatched Malik Nabu, Zafar Khan, and Nanak Hindi, with an army consisting of one hundred thousand horse and foot, – Oh thou for whom there is an army that obtains victory, – to conquer the province of Telingana. When they arrived on its frontier, the Rai of that province adopted a prudent resolution, submitted to the Muhammadans, and agreed to pay an annual tribute and receive the royal collectors, and that populous territory replete with every kind of wealth – As the cheek of your friend full of excellence, In which are all desires you are in search of, – containing more than 30,000 tracts of country, was added to the Muhammadan empire. It is related that 6,000 kharwars, or loads, of gold were dispatched to Dehli, – Much yellow gold was in the large sacks, – and in consequence of the abundance of diamonds obtained by plunder, they became so cheap that, one weighing a miskal, could be purchased for three dinars.

(c) Invasion of Dwarsamundar, Abdu-llah, Wassaf[12]

The royal army marched from this place towards the country of Dur Samun. Rai Pandya offered opposition, and begged the assistance of an army from Ma'bar. At that time enmity prevailed between the two brothers, Sundar Pandi and Tira Pandi, after the murder of their father. The latter sent to his assistance an army of horse and foot. Subsequently, the Rai, turning to the right rank, declined a contest, and, having proffered his submission, he was left in possession of his country without the necessity of fighting.

He delivered up to Malik Kafur the country of Arikanna, as a proof of his allegiance, and treasure beyond what imagination can conceive, together with 55 large elephants, which were worthy of carrying the great and fortunate heroes of the time, so that the country was restored to him, and, instead of shell-blowing, pyrolatry, and idol-worship, the true faith and the five daily prayers were established. On account of these transactions the fame of the first holy wars which opened Hind under Mahmud Subuktigin was erased from the page of history.

At the present time the imperial army consists of 475,000 Muhammadan disciplined holy warriors, whose names are recorded by the imperial muster-master, and whose pay and rations are entered in the regulations of the deputy-victualler. They are most obedient to the orders they receive, and are prepared to sacrifice their lives for the especial sake of their religion. Four hundred war elephants…are kept in the royal stables, and forty swift camels…are employed to convey daily reports, with the greatest expedition, from and to the distant provinces of the empire…-

(d) Invasion of Ma'bar, Abdu-llah, Wassaf[13]

In the month of Rajab of the year 710 H. (1310 A.D.) the appointed leaders, accompanied by a select army, were dispatched to conquer Ma'bar, and some of the towns were obtained through the animosity which has lately arisen between the two brothers; when at last a large army, attended by numerous elephants of war, was sent out to oppose the Muhammadans. Malik Nabu, who thought himself a very Saturn, was obliged to retreat, and bring back his army.

8. Sultan Muhammad bin Tughlaq

(a) System of presenting gifts to the Sultan, Ibn Battuta[14]

Every person proceeding to the court of this king must needs have a gift ready to present to him, in order to gain his favour. The sultan requites him for it by a gift many times its value. When his subjects grew accustomed to this practice, the merchants in Sind and India began to furnish each newcomer with thousands of dinars as a loan, and to supply him with whatever he might desire to offer as a gift or to use on his own behalf, such as riding animals, camels, and goods. They place both their money and their persons at his service, and stand before him like attendants. When he reaches the sultan, he receives a magnificent gift from him and pays off his

debt to them. This trade of theirs is a flourishing one and brings in vast profits. On reaching Sind I followed this practice and bought horses, camels, white slaves and other goods from the merchants. I had already bought from an 'Iraqi merchant in Ghazna about thirty horses and a camel with a load of arrows, for this is one of the things presented to the sultan. This merchant went off to Khurasan and on returning to India received his money from me. He made an enormous profit through me and became one of the principal merchants.

(b) The Sultan's palace, Ibn Battuta[15]

The sultan's palace at Delhi is called *Dar Sara,* and contains many doors. At the first door there are a number of guardians, and beside it trumpeters and flute-players. When any amir or person of note arrives they sound their instruments and say "So-and-so has come, so-and-so has come." The same takes place also at the second and third doors. Outside the first door are platforms on which the executioners sit, for the custom amongst them is that when the sultan orders a man to he executed, the sentence is carried out at the door of the audience hall, and the body lies there over three nights. Between the first and second doors there is a large vestibule with platforms along both sides, on which sit those whose turn of duty it is to guard the doors. Between the second and third doors there is a large platform on which the principal naqib [keeper of the register] sits; in front of him there is a gold mace, which he holds in his hand, and on his head he wears a jewelled tiara of gold, surmounted by peacock feathers. The second door leads to an extensive audience hall in which the people sit. At the third door there are platforms occupied by the scribes of the door. One of their customs is that none may pass through this door except those whom the sultan has prescribed, and for each person he prescribes a number of his staff to enter along with him. Whenever any person comes to this door the scribes write down "So-and-so-came at the first hour" or the second, and so on, and the sultan receives a report of this after the evening prayer. Another of their customs is that anyone who absents himself from the palace for three days or more, with or without excuse, may not enter this door thereafter except by the sultan's permission. If he has an excuse of illness or otherwise he presents the sultan with a gift suitable to his rank. The third door opens into an immense audience hall called *Hazar Uslun,* which

means ‘A thousand pillars.’ The pillars are of wood and support a wooden roof, admirably carved. The people sit under this, and it is in this hall that the sultan holds public audiences.

(c) The Sultan’s court, Ibn Battuta[16]

As a rule his audiences are held in the afternoon, though he often holds them early in the day. He sits cross-legged on a throne placed on a dais carpeted in white, with a large cushion behind him and two others as armrests on his right and left. When he takes his seat, the wazir stands in front of him, the secretaries behind the wazir, then the chamberlains and so on in order of precedence. As the sultan sits down the chamberlains and naqibs say in their loudest voice *Bismillah.* At the sultan’s head stands the ‘great king’ Qabula with a fly-whisk in his hand to drive off the flies. A hundred armour-bearers stand on the right and a like number on the left, carrying shields, swords, and bows. The other functionaries and notables stand along the hall to right and left. Then they bring in sixty horses with the royal harness, half of which are ranged on the right and half on the left, where the sultan can see them. Next fifty elephants are brought in, which are adorned with silken cloths, and have their tusks shod with iron for greater efficacy in killing criminals. On the neck of each elephant is its mahout, who carries a sort of iron axe with which he punishes it and directs it to do what is required of it. Each elephant has on its back a sort of large chest capable of holding twenty warriors or more or less, according to the size of the beast. These elephants are trained to make obeisance to the sultan and incline their heads, and when they do so the chamberlains cry in a loud voice *Bismillah.* They also are arranged half on the right and half on the left behind the persons standing. As each person enters who has an appointed place of standing on the right or left, he makes obeisance on reaching the station of the chamberlains, and the chamberlains say *Bismillah,* regulating the loudness of their utterance by the rank of the person concerned, who then retires to his appointed place, beyond which he never passes. If it is one of the infidel Hindus who makes obeisance, the chamberlains say to him ‘God guide thee.’

(d) Loves the company of learned men, Shihabuddin al Umari[17]

The jurist *Abul Fadhail Omar bin Ishaq ash-Shibli* narrated to me that this Sultan does not leave the company of learned men whether in travel or in

residence. He says: We were with him in one of his conquests. When we were on the way news of the victory reached him from the advance guard while we were in his presence. Then a joy befell him and he said: This is due to the blessing of those Ulama. Then he ordered them to enter the public treasury and they carried away as much wealth as they could. Those who were weak amongst them appointed a substitute who carried this wealth for them. The narrator continues, "They entered the treasury, but I did not enter, not did many of my peers because we did not belong to that group. Every one of those carried away two purses, each one containing 10,000 *dirhams*. But one of them carried three purses, two beneath his armpit, the other one on his head. When the Sultan saw them, he laughed in astonishment at the avarice of him who carried three. He (Sultan) asked about the rest of the persons and those who had not entered like me. It was said to him that these were below those because those were professors and these were assistants. He then ordered 10,000 *dirhams* to be given to everyone of them, and they were distributed among us. The narrator continues: the beacon of *shariat,* (Muslim Law) is standing on account of him and love for men of letters is found with him. They are shown honour and veneration. They exert to the highest to preserve that by which their reputation is established, by improving their mind and their appearance and in persevering in studying and in imparting knowledge, and right deliberation in all matters and moderation in all their affairs.

(e) Generosity of Sultan Muhammad bin Tughlaq, Ibn Battuta[18]

I shall now mention a few of his magnificent gifts and largesses…

The doctor Shams ad-Din, who was a philosopher and a born poet, wrote a laudatory ode to the sultan in Persian. The ode contained twenty-seven verses, and the sultan gave him a thousand silver dinars for each verse. This is more than has ever been related of former kings, for they used to give a thousand dirhams for each verse, which is only a tenth of the sultan's gift. Then too when the sultan heard the story of the learned and pious qadi Majd ad-Din of Shiraz, whose history we have written in the first volume, he sent ten thousand silver dinars to him at Shiraz. Again, Burhan ad-Din of Sagharj [near Samarqand] was a preacher and imam so liberal in spending what he possessed that he used often to contract debts in order to give to others. The sultan heard of him and sent him forty thousand dinars, with a

request that he would come to Delhi. He accepted the gift and paid his debts with it, but went off to Cathay and refused to come to the sultan, saying "I shall not go to a sultan in whose presence scholars have to stand."

One of the Indian nobles claimed that the sultan had put his brother to death without cause, and cited him before the qadi. The sultan walked on foot and unarmed to the qadi's tribunal, saluted him and made obeisance, having previously commanded the qadi not to rise before him or move when he entered his court, and remained standing before him. The qadi gave judgement against the sultan, to the effect that he must give satisfaction to his adversary for the blood of his brother, and he did so. At another time a certain Muslim claimed that the sultan owed him a sum of money. They carried the matter before the qadi, who gave judgement against the sultan for the payment of the debt, and he paid it.

When a famine broke out in India and Sind, and prices became so high that a maund of wheat rose to six dinars, the sultan ordered that every person in Delhi should be given six months' provisions from the granary, at the rate of a pound and a half per person per day, small or great, freeman or slave. The doctors and qadis set about compiling registers of the population of each quarter and brought the people, each of whom received six months' provisions.

(f) Foreigners honoured by Sultan Muhammad bin Tughlaq, Ibn Battuta[19]

The king of India, Sultan Muhammad Shah, makes a practice of honouring strangers and distinguishing them by governorships or high dignities of State. The majority of his courtiers, palace officials, ministers of state, judges, and relatives by marriage are foreigners, and he has issued a decree that foreigners are to be given in his country the title of *'Aziz* [Honourable], so that this has become a proper name for them.

(g) Cruelty of Sultan Muhammad bin Tughlaq, Ibn Battuta[20]

This king is of all men the fondest of making gifts and of shedding blood. His gate is never without some poor man enriched or some living man executed, and stories are current amongst the people of his generosity and courage and of his cruelty and violence towards criminals...

In spite of all we have said of his humility, justice, compassion for the needy, and extraordinary generosity, the sultan was far too ready to shed

blood. He punished small faults and great, without respect of persons, whether men of learning, piety, or high station. Every day hundreds of people, chained, pinioned, and fettered, are brought to his hall, and those who are for execution are executed, those for torture tortured, and those for beating beaten. It is his custom that every day all persons who are in his prison are brought to the hall, except only on Fridays; this is a day of respite for them, on which they clean themselves and remain at ease – may God deliver us from misfortune ! The sultan had a half-brother named Masud Khan, whose mother was the daughter of Sultan 'Ala ad-Din, and who was one of the most beautiful men I have ever seen on earth. He suspected him of wishing to revolt, and questioned him on the matter. Masud confessed through fear of torture, for anyone who denies an accusation of this sort which the sultan formulates against him is put to the torture, and the people consider death a lighter affliction than torture. The sultan gave orders that he should be beheaded in the market place, and his body lay there for three days according to their custom.

(h) Inhabitants asked to leave Delhi, Ibn Battuta[21]

One of the gravest charges against the sultan is that of compelling the inhabitants of Delhi to leave the town. The reason for this was that they used to write missives reviling and insulting him, seal them and inscribe them, "By the hand of the Master of the World, none but he may read this." They then threw them into the audience-hall at night, and when the sultan broke the seal he found them full of insults and abuse. He decided to lay Delhi in ruins, and having bought from all the inhabitants their houses and dwellings and paid them the price of them, he commanded them to move to Dawlat Abad. They refused, and his herald was sent to proclaim that no person should remain in the city after three nights. The majority complied with the order, but some of them hid in the houses. The sultan ordered a search to be made for any persons remaining in the town, and his slaves found two men, in the streets, one a cripple and the other blind. They were brought before him and he gave orders that the cripple should be hung from a mangonel and the blind man dragged from Delhi to Dawlat Abad, a distance of forty days' journey. He fell to pieces on the road and all of him that reached Dawlat Abad was his leg. When the sultan did this, every person left the town, abandoning furniture and possessions, and the city

remained utterly deserted. A person in whom I have confidence told me that the sultan mounted one night to the roof of his palace and looked out over Delhi, where there was neither fire nor smoke nor lamp, and said "Now my mind is tranquil and my wrath appeased." Afterwards he wrote to the inhabitants of the other cities commanding them to move to Delhi to repopulate it. The result was only to ruin their cities and leave Delhi still unpopulated, because of its immensity, for it is one of the greatest cities in the world. It was in this state that we found it on our arrival, empty and unpopulated, save for a few inhabitants.

(i) The army and officers of the Government, *Subh-ul-A'sha*[22]

It is related that his army consists of 900,000 horsemen, a part of them are at His Majesty's court, others are scattered in the whole country. His Diwan provides for the means of subsistence for all of them. The army consists of Turks, Khitais, Persians, Indians and people of various nations. All of them have branded horses, excellent weapons and are elegant in appearance. The officers of his army are the Khans, Maliks, Amirs, Sipah-Salars and then the ranks.

He relates that in the Sultan's service there are eighty Khans or more and that each of them has followers according to his rank. The Khan has ten thousand horsemen, the Malik one thousand, the Amir one hundred, and the Sipah-Salar less than that. None of the Sipah-Salars are considered worthy to be near the Sultan, but they can be appointed as Valis or to posts equal to the rank of Vali. The Sultan has ten thousand Turkish slaves and ten thousand eunuchs; one thousand cashholders and one thousand Bashmaqdars [in charge of horseshoes of the Sultan]. He has two lakhs of *stirrup* slaves, who wear weapons, accompany him always and fight on foot in front of him. The whole army is exclusively attached to the Sultan and his Diwan pays them, even those who are in the service of the Khans and Maliks and Amirs. Fiefs cannot be given to them by their masters as it is the custom in Egypt and Syria….

Besides these he has one thousand falconers *(bazdar)* who carry the birds of prey for hunting while riding the horses and three thousand drivers who obtain the game; five hundred courtiers *(nadim)* and two hundred musicians besides his one thousand slaves who are specially trained for music; one thousand poets of fine taste and wit in Arabic, Persian and Hindi. His

Diwan pays all these as long as they are men of spotless purity and chastity, in public and private life.

(j) Royal elephants and slaves, Shihabuddin al Umari[23]

The Sultan has 3000 elephants which are covered in battle with iron trappings inlaid with gold. In times of peace they are covered with housing of silk brocade and different kinds of silk adorned with figures. They are adorned with canopy and seats overlaid with plates; and wooden towers are fixed on them with nails and the Indians construct their seats for fighting. On an elephant are from 10 to 6 men according to the strength of the elephant.

The Sultan has 20,000 Turkish slaves. *Al-Bazzi* says: 10,000 eunuchs, 1,000 treasurers, 1,000 *Bashmaqdars,* 2,00,000 attendants, who wear weapons and march with the Sultan in front of him.

(k) Karkhanas, Shihabuddin al Umari[24]

This Sultan has an embroidery house in which 4,000 silk-workers who make different kinds of cloth for robes of honour and garments and gifts in addition to the stuff which is imported from China, Iraq and Alexandria. The Sultan distributes every year 2,00,000 complete garments, namely 1,00,000 in spring and 1,00,000, in autumn. The garments, of spring are mostly from Alexandrian stuffs made in Alexandria; the garments of summer are all of silk made in the factory in Delhi and stuff from China and Iraq. He distributes (them) in Khanqahs and hospices.

The Sultan has 4,000 embroiderers who manufacture the brocades for the harem and manufacture things for his use which he bestows upon the officers of the state and presents (them) to their wives…

(l) Conquests of Sultan Muhammad bin Tughlaq, Shihabuddin al Umari[25]

The first place which was conquered was the country of Tilink [the Kakatiya kingdom of Telengana, was conquered by Muhammad bin Tughluq before his accession]. It is an extensive province with many villages, the number of which is nine hundred thousand and nine hundred. Then the province of Jajnagar [capital of Orissa] was conquered. In it there are 70 fine cities all ports on the sea, the revenue of which consists of pearls, elephants, different kinds of cloth, perfumes and aromatics. Then the province of Lakhnauti [Bengal, it was conquered by the Sultan's father] was

conquered which has been the seat of nine kings. Then the province of Devagir [the northern most Hindu kingdom of the south] was conquered. It has 84 strong hill forts. *Sheikh Burhanuddin Abu Bakr bin al-Khallal aI-Bazzi* related that there are one crore and two lakh villages in it. Then the province of Dursamand [Dwarasamudra] was conquered where *Sultan Bilal Deo* [Vira Ballala III, the Hoysala king of Dwarasamudra] and five infidel kings reigned. Then the province of Mabar was conquered.

It is a big country having ninety ports on the seacoast the revenue of which is derived from perfumes, muslin (lains), various kinds of cloth and other beautiful things.…

The Sufi Shaikh Burhanuddin Abu Bakr bin al-Khallalh Muhammad al-Bizzi has related to me the following: This Sultan sent his army to the province of…[name cannot be deciphered, Telingana?] and it is in the neighbourhood of Dewogir, in the extremity of its frontiers. The people were infidels and every king was called 'rai'. When the troops of the Sultan took the field against him he sent a messenger saying: Say to the Sultan that he should refrain from us and whatever he wishes in the form of wealth it will be given to him, he should send as many beasts of burden as he likes to carry away. The commander of the army sent information to the Sultan as to what he (the rai) had said. His answer came back that he should refrain from fighting them and give quarter to the Rai. When he presented himself before the Sultan, he honoured him very much and said to him: I have never heard the like of what you have said. What is the amount of wealth you have got that you have told me to send you as many beasts of burden as I like to carry that. The Rai replied: Seven rais have preceded me in this country and everyone of them collected 70,000 Babin and all of them are still with me. He said: A *bobin* is very wide cistern from the four sides of which one descends into it with ladders. The Sultan was surprised at his speech and ordered the sealing of the *babins* with his name (to preserve them). So they were sealed with the name of the Sultan. Then he ordered the Rai to nominate a viceroy in his country and that he himself should reside in Delhi and he offered him Islam, but he refused. So he let him act freely in the matter of his religion and he stayed in his court appointing a regent for him in his country and the Sultan assigned attendants for him, suitable for one like him and sent to that country great sums to be distributed to his people as alms saying that they were counted amongst the

number of his subjects. The Sultan did not interfere with the *babins,* but only put on them the seal and left them in the same condition under his seal. I have related this according to what *al-Bazzi* related and he is known for his veracity. The responsibility is with him. He who wants further information should turn to him.

(m) His Holy Wars, Shihabuddin al Umari[26]

This Sultan is not slow in waging Holy War *(Jihad)*. In the holy war by land or by sea his bridle or his spear do not deviate (from it). This is the sole object which engages his eye and his ear. He has spent a large amount in exalting the word of Faith and in spreading Islam in these regions, so that the light of Islam was spread in these parts and the lightning of the true guidance flashed in these regions and the fire-temples were destroyed and the Buddha's statues and idols were broken and the land was freed from those who were not (included) in the land of security, that is, those who had not entered the contract of a *Zimmis* and through him Islam was spread up to the farthest East, and reached up to where the Sun rises, and he carried the banners of the Islamic people as *Abu Nasr-al-Aini* says, to where never a banner had reached and no chapter, *surat,* or verse *(ayat)* was read of the Quran. Then he built mosques and places of worship and replaced music by prayer-call and silenced the mumblings of the Magians by the recitation of the Quran, and he directed the people of this faith (Islam) against the fortresses of the infidels. And he has appointed them with the help of God as the heirs of their property and their lands and the country which they had never trodden under foot: land after land was placed under the banner of this Sultan. On land his banners are like eagles and on sea the banners are like the crows of the running ships, so that no day passes without the sale of thousands of slaves for the lowest prices on account of the great number of captives and prisoners.

B. Sultan of Bedar

1. Rulers and subjects at Bedar, Athanasius Nikitin[27]

The rulers and the nobles in the land of India are all Khorassanians. The Hindoos walk all on foot and walk fast. They are all naked and barefooted, and carry a shield in one hand and a sword in the other. Some of the servants are armed with straight bows and arrows.

2. Nobility and condition of people, Athanasius Nikitin[28]

The land is overstocked with people; but those in the country are very miserable, whilst the nobles are extremely opulent and delight in luxury. They are wont to be carried on their silver beds, preceded by some twenty chargers caparisoned in gold, and followed by 300 men on horseback and 500 on foot, and by horn-men, ten torchbearers and ten musicians.

The sultan goes out hunting with his mother and his lady, and a train of 10,000 men on horseback, 50,000 on foot; 200 elephants adorned in gilded armour, and in front one hundred horn-men, 100 dancers, and 300 common horses in golden clothing, 100 monkeys, and 100 concubines, all foreign (haurikies).

The sultan's palace

The sultan's palace has seven gates, and in each gate are seated 100 guards and 100 Mahommedan scribes, who enter the names of all persons going in and out. Foreigners are not admitted into the town. This palace is very wonderful; everything in it is carved or gilded, and, even to the smallest stone, is cut and ornamented with gold most wonderfully. Several courts of justice are within the building.

3. Hindus at Bedar, Athanasius Nikitin[29]

I came to Bedar from Kulongher on the day of Philip (14th of November) …and made acquaintance with many Hindoos, told them what was my faith; that I was neither Mahommedan nor. . . (caaedronie, saiadenie?), but a Christian; that my name was *Ofonasey,* and my Mahommedan name *Khoza Issuf Khorossani.* After that they no more endeavoured to conceal anything from me, neither their meals, nor their commerce, nor their prayers, nor other things; nor did they try to hide their women. And I asked them all about their religion, and they said: 'We believe in Adam;' and they hold the *Budhs* to be Adam and his race. There are in all eighty-four creeds, and all believe in *Boot* (Buddha), and no man of one creed will drink, eat, or marry with those of another. Some of them feed on mutton, fowls, fish, and eggs, but none on beef.

4. Bedar-Vijayanagar conflict, Athanasius Nikitin[30]

The sultan (of Bedar) moved out with his army on the fifteenth day after the Ulu Bairam to join Melich-Tuchar at Kulburga. But their campaign was

not successful, for they only took one Indian town, and that at the loss of many people and treasures.

The Hindoo sultan Kadam is a very powerful prince. He possesses a numerous army, and resides on a mountain at Bichenegher (Bijanagar). This vast city is surrounded by three *forts,* and intersected by a river, bordering on one side on a dreadful *jungel,* on the other on a dale; a wonderful place, and to any purpose convenient. On one side it is quite inaccessible; a road goes right through the town, and as the mountain rises high with a ravine below, the town is impregnable.

The enemy besieged it for a month and lost many people, owing to the want of water and food. Plenty of water was in sight, but could not be got at.

This Indian stronghold was ultimately taken by Melikh Khan Khoda, who stormed it, having fought day and night to reduce it. The army that made the siege with heavy guns, had neither eaten nor drunk for twenty days. He lost five thousand of his best soldiers. On the capture of the town twenty thousand inhabitants, men and women, had their heads cut off; twenty thousand, young and old, were made prisoners, and sold afterwards at ten tenkas and also at five tenkas a head; the children at two tenkas each. The treasury, however, having been found empty, the town was abandoned.

C. The Sultan of Padua

Ming Chinese ambassador's account in 1415[31]

The dwelling of the King is all of bricks set in mortar, the flight of steps leading up to it is high and broad. The halls are flat-roofed and white-washed inside. The inner doors are of triple thickness and of nine panels. In the audience hall all the pillars are plated with brass ornamented with figures of flowers and animals, carved and polished. To the right and left are long verandahs on which were drawn up (on the occasion of our audience) over a thousand men in shining armour, and on horseback outside, filling the courtyard were long ranks of (our) Chinese (soldiers) in shining helmets and coats of mail, with spears, swords, bows and arrows, looking martial and lusty. To the right and the left of the King were hundreds of peacock feather umbrellas and before the hall were some hundreds of soldiers mounted on elephants. The king sat cross-legged in the

principal hall on a high throne inlaid with precious stones and a two-edged sword lay across his lap…

Two men bearing silver staffs and with turbaned heads came to usher (us) in. When (we) had taken five steps forward (we) made salutation. On reaching the middle (of the hall) they halted and two other men with gold staffs led us forward with some ceremony as previously. The King having returned our salutations, kowtowed before the Imperial Mandate, raised it to his head, then opened and read it. The imperial gifts were all spread out on carpets in the audience hall…(The Sultan) bestowed on the envoys gold basins, gold girdles, gold flagons, and gold bowls.

Publisher's Note

In the year 2004, on returning from South East Asia, Nobel Prize recipient, Sir Vidia Naipaul requested us to arrange a meeting with a group of Delhi based thinkers to share the impressions of his visit. He was simply overwhelmed with what he saw in South East Asian countries like Indonesia, Thailand, Cambodia etc. We hurriedly, invited about twenty people to a get together with Sir Vidia. The meeting held on June 15, 2004 was attented by Sarva Shri Dinanath Mishra, Balbir Punj, Brij Kishore Sharma, Shankar Saran, Meenakshi Jain, Sandhya Jain, Ram Madhav, Devendra Swarup and some others. Sir Vidia described how he was astonished to see deep Indian cultural influence in the region not only in the past but even today. He felt sad that present day Indians appeared to have little recollection of the grandeur of their ancient civilization and its lasting contribution to the world civilization. He felt strongly that it would be a worth while endeavour to prepare a compendium of foreign perceptions of India down the ages.

During later discussions, it was decided that the project would cover the period from earliest times up to the mid-nineteenth century, the changed sensibility towards India thereafter consequent to the establishment of the British Colonial rule, being well known. The present volumes are the result of these deliberations.

We are thankful to Sandhya Jain and Meenakshi Jain for agreeing to take up the project despite their other professional commitments and completing it so meticulously. We are grateful to Prof. Devendra Swarup for having agreed to coordinate the project till its fruition. Sandhya Jain compiled and edited the material for the first volume, while Meenakshi Jain prepared the remaining three volumes. Both of them have recorded their experiences and impressions in detailed Introductions to their respective volumes separately.

We wish to place on record our heartfelt gratefulness to Sir Vidia for not only conceiving the project, but also for painstakingly going through volumes I and III and making many valuable suggestions which the editors have attempted to incorporate. We feel indebted to Prof. Lokesh Chandra and Dr. B.M. Pande for their valuable contribution in the preparation of the first volume. We are highly grateful to Prof. Devendra Swarup, without

whose continuous active guidance and involvement, this ambitious project would not have seen the light of the day.

We are conscious that many other compilations of foreign accounts on India are already available, but we do feel that this series of four volumes will add much to the present knowledge of our readers in this area and also pave the way for publication of many other volumes based on the first hand study of the original sources in foreign languages other than English as, it was painfully discovered during the preparation of these volumes that most of the material still lies untranslated into English, which is the only window available to most of the Indian Scholars. With this Note, we offer these volumes to our readers and cordially invite their comments and suggestions, which would help us to improve the quality of the later editions.

Introduction

The arrival of Vasco da Gama on the western coast of India, near Calicut, on 27 May 1498, heralded the restoration of Europe's links with the subcontinent after an interval of almost eight centuries. The links, which could be traced back to the days of Alexander the Great, and even earlier to Harappan times, had been ruptured in the medieval era with the establishment of Arab control over the land and sea routes to India. The Arab monopoly of routes prompted Europe to embark on a centuries-long quest to re-establish contact with India, which reached its fruition with Vasco da Gama's landing.

India's communication with the Western world in ancient times had been through both land and sea. The land routes traversed the Khyber and Kurrum passes in the north-west (known as the *Uttarapath*) and meandered along the Makran Coast in the south-west. The former route, passing through Persia and Central Asia, ended at Constantinople on the Baltic Sea, the latter via Mesopotamia terminated at Syria on the eastern Mediterranean coast.

Indian traders using the sea route through the Persian Gulf would unload their wares on the northern tip of the Gulf from where these would be carried through Syria to the ports of Tyre and Acre on the eastern Mediterranean coast. Goods transported through the Red Sea were offloaded on the eastern coast of Egypt and taken to the ports of Alexandria and Carthage on the southern Mediterranean coast. Alexandria and Carthage were, in fact, the principle transit points for trade between India and Europe.

Available evidence indicates that at the outset only Indian ships sailed the Indian Ocean, crossing the Persian Gulf and the Red Sea. It was only after the discovery of the direction of the south-west summer monsoon by the Greek, Hippalus, on the eve of the Christian era, that Roman ships began visiting Indian shores.

Rome imported a variety of goods from India, including Kashmiri wool, musk, ivory and precious stones. Roman moralists expressed exasperation at the vast sums spent on procuring these items of luxury. But the items most in demand were silk and spices, the staples of the land and sea trade respectively. Pepper had become an essential in European cookery and was

also used in the preparation of medicines and drugs. Pliny remarked, “It is quite surprising that the use of pepper has come so much into fashion …”

Trade also promoted cultural exchange, which was particularly marked in the realms of philosophy, religion and language as testified by Greek and Roman writers. Modern scholarship noted with wonder the similarities between Greek, Latin and Sanskrit. A positive image of India was created in the European mind.

The advent of Islam and the attendant era of Arab expansion dramatically altered the world scenario. The Arabs conquered Baghdad in A.D. 634, Syria in A.D. 636, Persia between A.D. 636 and 650, Egypt in A.D. 642 and Carthage on the northern Africa coast in A.D. 698. In A.D. 711, they crossed the Gulf of Gibraltar and entered the Iberian Peninsula. By A.D. 827, they had entrenched themselves in Sicily and some years later even plundered Rome.

The seizure of the ports of Alexandria and Carthage, the Gulf of Gibraltar and the island of Sicily converted the Mediterranean into an Arab lake. The spree of conquests from Spain to India enabled the Arabs to link the two major economic units of the Mediterranean and the Indian Ocean and dominate all the important maritime and caravan routes.

European traders in cities like Venice, Genoa, Florence, Pisa and Milan suddenly found themselves at the mercy of Arab traders, who demanded exorbitant sums for Eastern goods. European consumers also began to feel the impact of the sharp escalation in prices, particularly of spices that could be obtained only from India and Indonesia. ‘Pepper,’ as a scholar observed, “may not mean much to us, but in that age it ranked with precious stones. Men risked the perils of the deep and fought and died for pepper.” The spice trade became the chief determinant in the politics of the Levant and was the single most powerful stimulant in European expansion in the fifteenth century. India was the destination that fired European mercantile ambitions in the Age of Discovery.

The conflict between Europe and the Arabs was, however, not confined to the field of commerce. It had a religious dimension as well. Islamic expansion posed a serious threat to Christianity, which, by the seventh century, had been able to extend its sway only over Southern and Western Europe, North Africa and West Asia. By the beginning of the eighth

century, the Arabs had dislodged it from North Africa and parts of West Asia, and additionally Islam had advanced up to the Iberian Peninsula in Western Europe. Arab conquests were accompanied by the wholesale conversion of the conquered people and the imposition of Islamic cultural forms. Resistance led to massacres or forced migrations as in the case of the Jews, the Syrian Christians and the Zoroastrians of Iran who fled their homeland and sought shelter in India.

The Christian world at the time of the first Mohammedan invasions was riven with fractiousness. Clergy wrangled with clergy on abstruse points of doctrine and sect persecuted sect with inexhaustible animosity. The two principle branches of the faith were the Orthodox or Eastern Church with its headquarters at Antioch in Syria and the Roman Catholic Church with its centre at Rome. The prolonged struggle for survival against Islam considerably transformed Christianity. Ironically it acquired several traits of its adversary – fanaticism, intolerance, ritualistic rigidity and the recourse to forced conversions.

Both the Orthodox and Roman Catholic Churches lost considerable territory to Islam, the former, Jerusalem, the birthplace of Jesus, the latter the Iberian Peninsula. To recompense their losses, they attempted to win new adherents in parts of Europe that still adhered to paganism. While the Orthodox Church registered success in Russia and the Slav regions generally, the Roman Catholic Church brought pagan Poland and the northern Germanic tribes into its fold. The new recruits in turn spread Christianity to the Scandinavian countries. In the twelfth century, the Germans and Scandinavians introduced Christianity in the regions around the Baltic Sea, namely Finland, Estonia and Livonia. By the close of the century, the Roman Catholic Church had extended its hold over the entire continent up to the borders of Russia and the Byzantine Empire. Only Lithuania retained its independence and ancient forms of worship.

In the race for expansion, the Roman Catholic Church far outstripped its Orthodox rival, which bore the brunt of Islamic conquests and conversions in West Asia. It was also demoralised by the loss of Jerusalem. The Catholic Pope, on the other hand, could draw on the protection of the Holy Roman Emperor, Charlemagne (768-814) and the monetary support of the wealthy traders of Venice, Genoa, Pisa and Florence. Thus politically and

financially empowered, the Pope emerged as the rallying point of the Christian world in its encounter with expansionist Islam.

The excommunication of the Patriarch of the Orthodox Church in A.D. 1054 further undermined the position of the Eastern Church vis-à-vis its Roman counterpart. The defeat of the Byzantine forces by the Muslims in A.D. 1071 compelled the Byzantine Emperor, Alexius Comnenus, in 1094, to propose to the Roman Catholic Pope, Urban II (1088-1099), a joint campaign against Islam.

In response, the Pope, at a Council at Clermont in southern France, gave a call for a holy crusade against Islam. The French, Germans, Englishmen and Normans heeded his call. Merchants from Genoa, Pisa, and elsewhere, hopeful of the reopening of direct trade with India and other Eastern countries, arrived in Constantinople to provide financial assistance. The Emperor promised to make all lands conquered by the knights fiefs of East Rome.

The first Crusade, launched in A.D. 1096, led to the liberation of Jerusalem in A.D. 1099. A Christian kingdom was founded as a fief of the Pope and the Norman, Godfrey of Bouillon, crowned its king. Though plagued by dissensions, it survived for almost a hundred years.

The conquest of the town of Edessa in Asia Minor by the Turks in 1144, which snapped communication lines between the kingdom of Jerusalem and the European countries, precipitated a second Crusade. It, however, ended in failure.

In A.D. 1187, Jerusalem was again lost to Muslim forces led by Sultan Saladin. The news shocked the Christian world, which responded with a fresh Crusade. In all, nine Crusades were waged between A.D. 1096 and 1291, the last one being called off following the death of Louis IX of France in Tunis. The Crusades resulted in neither the liberation of Jerusalem nor the opening of the routes to India.

Though they failed in their objective, the Crusades helped strengthen Papal grip on the Christian population. Besides actively intervening in the political struggles in European countries, Pope Innocent III (1198-1216) asserted the authority of the Church in matters of belief. In A.D. 1209, he sent an army under a papal legate against the Albigenses, a popular group of so-called heretics in southern France who condemned the acquisition of

property and several customs regarded as the bedrock of the Church. Most of the sect was destroyed and the survivors dragged before an ecclesiastical tribunal and tortured into admitting their guilt.

The Inquisition, a tribunal entrusted with punishing those charged of heresy, used harshly by Innocent III, was in 1233, turned into a permanent institution by his successor, Pope Gregory IX. Confessions were forcibly extracted from those suspected of non-conformism and they were punished by confiscation of property, imprisonment, exile and even burning at the stake. New militant evangelical orders, such as the Franciscans, the Dominicans and the Carmelites became the principal agents of the Inquisition. The Knights Templars, the Hospitalers and other organisations, founded originally to protect the Holy Land, redirected their activities to the Baltic region to further the writ of Rome by Christianising the area. The Brethren of the Sword was created in 1202 to Christianise Livonia.

Several legends originated in Europe during the Crusades. In the twelfth century, the legend of Prester John gained currency. Prester John was believed to be a powerful Christian king, ruling in a region east of the Muslim world, presumably in India, who could aid the Crusaders in their fight against Islam. The Pope was believed to have received a letter from Prester John in A.D. 1165, promising full co-operation. Marco Polo's travels between A.D. 1271 and 1295 also began to be interpreted as an attempt to establish contact with Prester John. The story of the Apostle, St. Thomas, who was believed to have come to India in A.D. 52 and created a Christian community on the Kerala coast, also gained wide currency in Europe around this time.

Legends and myth-making notwithstanding, the Crusades failed to notch up any notable victories and the Muslims, in A.D. 1291, captured Acre on the Syrian coast, the last stronghold in the Holy Land. With this were shattered Europe's hopes of reaching India through an eastern route. Genoa and Florence were left with no option but to search for alternative routes to India. In desperation a Genoese navigator, Ugolino de Vivaldo, in 1291 attempted an expedition from Genoa via Gibraltar down the African coast. He was able to cross the Gulf of Gibraltar because of the changed situation in the Iberian Peninsula.

Portugal had emerged as an independent kingdom by A.D. 1179, the port of Lisbon and the Tagus valley had been won from the Muslims in A.D. 1147,

and the Spaniards, having taken Valencia on the Mediterranean Sea and Seville in the south, had reached the southern shores of the Iberian Peninsula. With the capture of the Balearic Island and the placement of an Aragon prince on the throne of Sicily in A.D. 1282, the groundwork for European maritime activity had been prepared.

Portugal, with its extensive coastline on the Atlantic, was in the forefront of maritime explorations. Portuguese kings, backed by Genoese and Florentine wealth and navigational expertise and the religious sanction of the Roman Catholic Church, provided energetic leadership. Prompted by religious fervour and the desire for commercial gain, King Diniz (1279-1325) founded the militant Order of Christ and in A.D. 1317, appointed a Genoese, Manoel Pessanha, admiral of the Portuguese navy. Pessanha, aided by other Genoese, laid the foundations of the Portuguese navy. Portugal thus emerged as the heir of the Genoese tradition of navigation and the vanguard of Christianity against Islam.

Prince Henry (1394-1460), whose contributions earned for him the title Navigator, built on these foundations to script the string of Portuguese successes. Fired by a spirit of militant Christian mysticism and an abhorrence of Islam, he believed he was divinely ordained to reach India. In 1415, at the age of 21, he had captured the port of Ceuta on the west coast of Africa, opposite Gibraltar, the very place from which Islam had entered Spain in A.D. 711.

Prince Henry planned to outflank Islam and take Christianity directly to the Indian Ocean. He gathered at his castle on the Cape of Sagres navigators, mathematicians, cartographers and astronomers and collected all available knowledge on the then known lands. His brother, Prince Pedro, travelled over Europe in search of information, even purchasing a copy of Marco Polo’s account of his travels, and maps of the known regions of the earth.

Prince Henry realised that to reach the East it was imperative that the African coast be explored. Thus, in 1420 Madeira was discovered, in 1431 the Azores and in 1434, after fourteen attempts, an expedition passed Cape Bajador. Subsequently his ships reached the coast of Guinea and crossed the Equator, a great achievement of Portuguese navigation that made possible the rounding of the Cape and the voyage to India.

With the coast of Africa up to Cape Verde under the control of Prince Henry, his biographer, Gomes de Azurara exulted, “Of a surety I doubt, if since the great power of Alexander and Caesar there hath even been any prince in the world that had set up the marks of his conquest so far from his land.” Barely three decades after Prince Henry, in A.D. 1487, Bartholomeu Dias discovered the Cape of Tempests, renamed the Cape of Good Hope, and reached the Indian Ocean. The sea route to India was at last open.

Portuguese preparations for their voyages were meticulously planned and cloaked in secrecy. The details of this story of exploration pursued by three generations of Portuguese kings are not germane to the present purpose. Pertinent are the factors that guided the quest for India – the desire to vanquish Muslim power; to acquire direct access to the spice and textile trade; to spread Christianity and to conquer and colonise the newly discovered areas.

As discussed earlier, the long centuries of confrontation with Islam had radically altered Christianity. Under the leadership of the Roman Catholic Church, which had emerged as the sole leader of Christendom, an aggressive and proselytising Christianity set forth from Europe. Portugal was the champion of this Christianity. In 1420, Prince Henry had acquired the office of apostolic administrator of the Order of Christ. In 1454, he received from Pope Nicholas V the right to all lands discovered up to India. The Papal Bull issued that year explicitly articulated the religious motive behind the venture,

“Our joy is immense to know that our dear son, Henry, Prince of Portugal, following the footsteps of his father of illustrious memory, King John, inspired with a zeal for souls like an intrepid soldier of Christ, has carried into the most distant and unknown countries the name of God and has brought into the Catholic fold the perfidious enemies of God and Christ, such as the Saracens and the Infidels.”

Further it stated “After having established Christian families in some of the unoccupied islands of the Ocean and having consecrated churches there for the celebration of Holy Mysteries the Prince, remembering that never within the memory of man had anyone been known to navigate the sea to the distant shores of the Orient, believed that he could give God the best evidence of his submission, if by his effort the Ocean can be made navigable as far as India, which, it is said, is already subject to Christ. If he

enters into relations with these people, he will induce them to come to the help of the Christians of the West against the enemies of the faith. At the same time, he will bring under submission, with the King's permission, the pagans of the countries not yet afflicted with the plaque of Islam and give them knowledge of the name of Christ."

The Bull excluded all others from entering the area marked out for Portugal on pain of excommunication. On 13 March 1456, Pope Calixtus III promulgated another Bull confirming the previous grant. It conceded the spiritual jurisdiction over the lands from Cape Nun to India to the Order of Christ. Two subsequent Bulls issued in A.D. 1493 and 1497 also allowed Portugal lands conquered from the unbelievers. Following the discovery of the sea route to India, the Holy See in 1502 honoured the king of Portugal with the title "patron of Catholic missions of the East".

Thus far Portugal had stood alone in the journey of exploration. But in 1469, as a consequence of the marriage of Ferdinand of Aragon to Isabella of Castile, the two kingdoms were joined and the modern state of Spain came into being. In 1492, Granada, the last Muslim possessions in Spain, was also vanquished. With a maritime coast now opening on the Atlantic Ocean, Spain joined the race to reach India. In 1492, another Genoese, Christopher Columbus, with Spanish patronage and support, sailed westwards and stumbled upon some unknown island, which he mistook for India. In June 1494, Spain and Portugal signed the Treaty of Trodesilhas whereby a line 370 leagues west of Cape Verde Islands was fixed as demarcating their respective spheres in the newly discovered regions, an agreement confirmed by Pope Alexander VI.

On 8 July 1497, four ships under Vasco da Gama sailed from the harbour of Belam at the mouth of the Tagus. With his landing, India became accessible to Portuguese conquistadors, traders, travellers, scholars and clergymen. The sixteenth century could, in a sense, be termed the Portuguese century, for no European power could challenge its mastery of the sea route to India.

The defeat of the Spanish Armada in 1588 by Holland and England, however, signaled the end of this monopoly and in 1595, the first Dutch fleet entered the Indian Ocean. In the seventeenth century, the Dutch, with their British camp followers, seriously undermined the Portuguese. The French also entered the Indian trade in the second half of this century.

While several Portuguese accounts of India in the sixteenth century are available, for the seventeenth century we also have the writings of travellers, scholars and missionaries from the latter three countries. Additionally, Jesuits of various nationalities wrote regular letters home, providing valuable information on facets of Indian life, albeit tempered by their religious bias.

This volume confines itself to European writings of sixteenth and seventeenth centuries. It does not claim to be exhaustive but presents glimpses of the Indian reality as recorded by contemporary European visitors. Only English translations have been used. A sizeable number of accounts in European languages still awaits translation.

Select List of Travellers and Writers

(in alphabetical order)

Baldaeus, Rev. Philippus, a Dutch clergyman, described his experiences in South India and Ceylon from 1656 to 1665 in his book, *Naan*

wkenrige beschryving van Malabar en Coromandal, published in Amsterdam in 1672. The third part of the book, translated "*A true and exact description of the most celebrated East Indian Coach of Malabar,"* is an account of Hinduism in South India. Baldaeus also published a brief grammar of Tamil.

Barbosa, Duarte accompanied his brother-in-law, Fernao de Magalhaes, in his voyage round the world. He arrived in India in 1501 with the fleet of Pedro Cabral and remained in the Indian Ocean region for sixteen years. As a royal factor he was in a position to closely study the commerce of the country. He knew the Malayalam language and has provided valuable information on the Malabar region. His *Book of Duarte Barbosa* was written around 1518. The manuscript was kept locked in Lisbon and published three centuries later.

Cabral, Pedro Alvares, a young navigator of noble lineage, he was a member of the second Portuguese voyage to India in 1550-1501. On the way to India, he 'discovered' Brazil.

Careri, Giovanni Francesco Gamelli, a lawyer by profession, arrived in Daman in 1695. He visited the Kanheri caves, which are not mentioned in the account of his countryman, Pietro Della Valle. Careri believed the he was the first European to write on the Caves, not knowing that Garcia da Orta had earlier penned a brief account of Mandapeshwar and Kanheri. Careri was, however, the first traveller to describe the Kanheri caves in minute details.

With the aid of Christian soldiers in the Mughal army, he managed to get an audience with the Mughal Emperor, Aurangzeb then encamped at Galgala and engaged in a contest which the Deccan powers. Careri's journal of his voyages was published in six volumes in 1699-1700, each volume dealing with one country.

Carre, Abbe wrote a detailed account of his travels from France to India via the Syrian Desert, Iraq and the Persian Gulf, during the years 1672-74. His visit to India coincided with the arrival of a French squadron in Indian waters to support French trade in the country and perhaps to drive the Dutch out of Ceylon. Abbe Carre appears to have reported on the activities of the French East India Company to Colbert, minister of Louis XIV. His observations on South India are particularly valuable, for most seventeenth century European travellers confined themselves to Western and Northern India. He seems to have been from a noble family and his brother held an important post at the French Court.

Castanheda, Fernao Lopes de set out for India in 1528 in the company of his father and spent the next ten years travelling in Asia. On his return home, he spent twenty years researching and published the first book of his *Historia do descobrimento e conquista da India pelos Portuquezes* in 1551.

Correia, Gasper was the author of *Lendas da India* (Legends of India).

Coryat, Thomas was the first Englishman, apart from the Jesuit, Thomas Stevens, to have set out for India with no thought of trade. He was prompted by the desire to see the country and write a book on his experiences. He started on his travels in October 1612, visiting several countries on the way. A remarkable feature of his journey was that he spent an average of around two pence a day. One factor that facilitated this inexpensive journey was the hospitality of the Eastern people to wandering pilgrims.

Coryat visited Ajmer in July 1615 and stayed there for almost fourteen months. Among the highlights of his visit was a dialogue with Jahangir in Persian. Coryat left for Agra in September 1616. He also visited Mandu. He died in Surat, at the age of forty, in December 1617.

Costa, Cristovao da arrived in Goa in 1568, with the Viceroy D. Luis de Ataide, as his personal physician. In 1569, he worked at the Royal Hospital of Cochin, where he treated the king of Cochin. He returned to Portugal in 1572. His famous book, *Treatise of drugs and medicines of East India,* was first published in 1578. A large part of it is the summary of Orta's *Coloquios.*

Couto, Diogo do was a leading Portuguese chronicler and author of the *Decada Quinta da Asia.*

Della Valle, Pietro was born in Rome in 1586, in an illustrious family that included two cardinals. In 1614, he embarked on a journey to Constantinople from where he went to Asia Minor and Egypt, Mount Sinai and Palestine, Jerusalem, Damascus and Baghdad. Thereafter he went to Persia, where he was granted an interview with King Shah Abbas and even took part in an expedition of the latter against the Turks. He visited the ruins of Persepolis and the city of Shiraz. He arrived in Surat in 1623 and thence went to Cambay, Ahmadabad, Goa, Ikkeri, Baricelor, Mangalur and Calicut. He left India in 1624. On his arrival in Rome he was well received by Pope Urban VIII and made honorary Chamberlain to the Pope.

Pietro Della Valle was a bold and observant traveller who knew Turkish, Persian and Arabic. He was the first foreigner to penetrate into the second pyramid and sent two mummies to Europe, now preserved at Dresden. He was also the first to draw attention to the rock inscriptions and cuneiform writings in Assyria. His travel narrative is divided into three parts, dealing with Turkey, Persia and India. The latter two sections were published after his death.

Federici, Cesare, a trader from Venice, accompanied two horse traders from Goa to the city of Vijayanagar. He arrived two years after the battle of Talikota and stayed there for seven months.

Finch, William's narrative is important for the topographical details he provided, based either on his journeys or derived by careful inquiry from others.

Fitch Ralph's account dates to the period before the establishment of the English East India Company, when English merchants were attempting to acquire a share in the eastern trade. An expedition, which included Ralph Fitch, was given a letter of introduction by Queen Elizabeth to Emperor Akbar (described as the King of Cambay). At Ormus, the group was arrested and sent to Goa where they remained in prison for over a month. The Dutchman, Linschoten, being with the Archbishop of Goa, was able to secure bail for the group in April 1584. On the pretext of an excursion, they crossed into the territory of the King of Bijapur from where they journeyed to Golconda.

Godinho, Fr. Manuel was born in Portugal in 1633. He joined the Society of Jesus in 1649 and in 1655 was sent to India to work on the Fishery Coast.

After the agreement to cede Bombay to England was announced in 1661, he was sent on a mission back home to persuade the Portuguese Court not to give effect to the transfer. His account of his journey from India to Portugal in 1663 throws light on society and politics in India at that time.

Hawkins, William was captain of the *Hector,* the first vessel to display the English flag on the coast of India. H was accorded a cordial reception by Emperor Jahangir, who discovering Hawkins' fluency in Turkish, held frequent discussions with him about European countries. So pleased was Jahangir with the Englishman that he permitted the English to trade at his ports. Hawkins was made captain of four hundred horse, married to an Armenian maiden, and granted a place among the grandees of the Mughal court. According to the Jesuits, he now began to dress like a Muhammadan nobleman. Hawkins appealed that a *farman* (order) be granted for the establishment of a factory at Surat, a request the Emperor conceded. Thereupon Hawkins left Agra in November 1011. The Governor of Surat, however, refused to allow the English to establish the factory in view of the Portuguese threat. Hawkins left in February 1612, and died en route to his home on the Irish shore.

Henriques, Fr. Henry, who worked on the Coromandal Coast for almost fifty years, was the first European to prepare a Tamil grammar, probably around 1567.The work was however discovered only four centuries later in the National Library in Lisbon. His *Flos Sanctorum*, on the lives of saints, in its reprint of 1967, is 669 pages long, in Tamil.

Kircher, Athanasius, the Jesuit, is regarded as among the founders of Egyptology. His monumental work, *China Illustrata (1667),* contains valuable information on China and India. He belonged to a group of ethnographers who studied paganism because they believed that the idea of God was present in all ancient religions. Kircher was interested in the origins of idolatry and studied the practice in China, Egypt and India. He paid considerable attention to the religious beliefs of the Brahmins. Father Heinrich Roth was among his principle informants on Hinduism. In *China Illustrata,* the Devanagari script appeared for the first time before a European audience.

Linschoten, Jan Huygen van, a native of Holland, reached Goa in 1584 where he remained till 1589 as Secretary to the Archbishop of Goa. His

travel diary, *Itinerario*, published in 1592, was probably the best account of Goa and the west coast to appear in print before 1800.

Lord, Reverend Henry, who arrived in Surat in 1624, wrote a highly rated treatise on Hindu beliefs and customs. The Orientalist, Sir William Jones, said of the work, "the inhabitants of this extensive tract are described by Mr. Lord with great exactness, and with a picturesque eloquence peculiar to our ancient language."

Manucci, Niccolao, a native of Venice arrived in India in 1656. His work, *Storia Do Mogor*, first published in four volumes in 1907-9, covers the last six years of Emperor Shah Jahan's reign and the entire reign of his successor, Aurangzeb. Manucci was employed as an artilleryman in the army of Prince Dara and after the latter's defeat in the war of succession, served (in disguise) in the army of Aurangzeb. He also briefly joined the services of Raja Jai Singh. He met the Maratha leader Shivaji in Aurangabad in 1665. He held various positions in the Mughal Court. After resigning from service, he stayed for a while in Goa. The Governor and Council of Madras granted him a house in the city where he died in 1717.

Nobili, Robert de, a Jesuit missionary, was sent to India in 1605. On arrival, he was amazed to discover that his predecessor in the Mission had not been able to convert a single native in fourteen years. Nobili was the first European to study Sanskrit.

Nuniz, Fernao, a Portuguese horse-trader, spent three years in Vijayanagar. He was greatly impressed by the city and kingdom, which he described in considerable detail.

Olafsson, **Jon (1618-1679)** an Icelander, completed his work around 1661.

Orta, Garcia da, physician to King John III, left for Goa in March 1534 with his friend Martim Afonso de Sousa (who had been appointed Captain-Major of the Indian Ocean). In India, he accompanied Martim Afonso de Sousa on several campaigns on the west coast between Kathiawar and Ceylon. He was present at the signing of the treaty between Nuno de Cunha and Bahadur Shah, ruler of Gujarat, on 23 December 1534, by which Bassein and Bombay were ceded to the Portuguese. Garcia da Orta settled in Goa as a medical practitioner. He died in 1568, five years after the publication of his famous book, *Coloquios dos simples e drogas da India.*

Paes, Domingo provided an invaluable account of Vijayanagar at the height of its glory. His account, together with that of Fernao Nuniz, is among the most important foreign sources on the kingdom.

Pelsaert, Francisco of Antwerp was appointed junior factor in the Dutch East India Company and posted to India in 1620. He remained in Agra until the end of 1627, rising to the position of senior factor. The *Remonstrantie,* written in 1626, sums up Pelsaert's experiences in Agra at an important moment for both the Dutch Company and Indian commerce. It is basically a commercial report, prepared for the Company, not for a popular audience.

Pires, Tome, the son of the apothecary of King John, ranks among the European pioneers, who studied the life of the Indian people and Indian medicine. He arrived at Cannanore in September 1511. His book *Suma Oriental,* written around 1512-1515, was discovered only in the 1930s and published for the first time in 1944. It provides a detailed account of India, including observations on elephantiasis, a disease unknown in Europe. Tome Pires left Cochin in February 1516.

Roger, Abraham was sent to the Coromandal Coast by the Amsterdam Classis in 1632. He preached and taught on Coromandal for 10 years in Tamil, Portuguese, and Dutch. Roger enlisted the help of a *Smarta* Brahmin, Padmanabha, to learn about Hindu customs and beliefs. Roger's book, "*De Opendeure tot het verborgen heydendom,"* published in 1651, two years after his death, is one of the most complete and objective accounts of Hinduism written by a foreigner. Roger was the first European to translate Bhartrahri.

Roth, Father Heinrich, a German, was attached to the Agra mission. He took back to Rome an illustrated account of the ten incarnations of Vishnu. This was included in Kircher's work, with a description of the cosmological myth on the origins of the four *varnas* from various parts of Brahma's body.

Sassetti, Filippo, a Florentine merchant, was the great-grandson of Francesco Sassetti, manager of the Medici enterprises in the fifteenth century. He arrived in India in 1583 and died in Goa in 1588. During his stay in India he sent no less than thirty-five letters to Florence on his observations on the country, on its trade, administration, religion, seasons, climate and natural history.

Stephens, Thomas, a Jesuit, was the first Englishman to reside in India. He arrived in Goa in October 1579 and stayed in India for forty years. He was particularly interested in learning the languages of this country. In 1616, his *Christapurana* was published in Marathi, and in 1622, after his death, his book on Christian doctrine written in Konkani.

Tavernier, Jean-Baptiste first arrived in India around 1640-1641 and altogether visited the country no less than five times. Among the important political personalities he met and did business with (he dealt in precious stones) were Mir Jumla, Chief Minister of Golconda, Shaista Khan, the Mughal governor in the Deccan and Emperor Aurangzeb.

On his return home, he was honoured by the French King, Louis XIV. When he was around 79 years old, Tavernier was approached by Frederick William, Elector of Brandenburg, who wished to appoint him his ambassador to India. Though the proposal did not fructify, Tavernier planned his seventh and last visit to the East when he was over 80 years old. He appears to have died somewhere near Moscow. Gibbon described him as "that wandering jeweller, who had read nothing, but had seen so much and so well."

Given his interest in business, he provides much valuable information on the state of commerce in medieval India. Since he visited India before Aurangzeb ordered the destruction of Hindu temples, he provides accounts of temples in Mathura and Banaras before they were levelled on Aurangzeb's orders.

Terry, Edward's account of India was based on the two and a half years he spent there as chaplain to Sir Thomas Roe. It also borrowed from the work of Thomas Coryat, Roe's companion for a considerable period. Terry joined Roe near Ujjain towards the end of February 1617.

Thevenot, Jean de arrived in India in 1666 and stayed for about a year, visiting important centres of commerce and industry. He was the first European to describe the rock cut temples at Ellora.

Valignano, Alessandro, a Jesuit, visited India between 1574 and 1606. He wrote of the natives, "These people, who are almost black and go half naked, are universally contemptible and held to be base by the Portuguese and other Europeans; and the truth is that compared to them they are of little substance and lack refinement" (Rubies2000:7).

Van Reede tot Drakenstein, Hendrik Adriaan (1636-91), the Dutch commander of Malabar, in the 1670s commissioned a gigantic work, *Hortus Indicus Malabaricus,* on the flora of the region. It was published in 12 folio volumes between 1678 and 1693. In the preface to volume III dedicated to the Raja of Cochin, Van Reede tot Drakenstein described the process of the construction of his herbal catalogue,

"By my orders, Brahmin and other physicians made lists of the best known and most frequently occurring plants in their languages. On this basis, others classified the plants according to the season in which they attracted notice for their leaves or flowers or fruit. This seasonal catalogue was then given to experts in plants, who were entrusted, in groups of three, with the collection of the plants with their leaves, flowers, and fruit, for which they even climbed the highest tops of trees. Three or four draftsmen, who stayed with me in a convenient place, would accurately depict the living plants as the collectors brought them. To these pictures a description was added, nearly always in my presence" (Raj 2006: 44).

Varthema, Ludevico di, a Venetian, travelled to the East by way of the Red Sea in 1502 and returned to Europe via the Cape in 1507. He was in Calicut some years after the arrival of the Portuguese and in Goa on the eve of its fall. He did not travel beyond Calicut. His book, *Itinerario* published in 1510, was highly successful and went through many editions in Europe.

Withington, Nicholas had come out as a fleet attendant and obtained service in the East India Company at Surat probably because of his knowledge of Arabic. In October 1613, he accompanied a Company official to Ahmadabad to purchase indigo. From there he visited Cambay and Sarkhej, writing interesting accounts of these places. In 1615 he was charged with defrauding the Company and left for England.

C. Precious metals and stones

D. Fauna

A. Flora

Some scenic descriptions

1. Father Jerome Xavier, member of the third Jesuit mission, on the river Ravi near which the Jesuits were lodged in some royal houses by Emperor Akbar in 1596[1]

This river is called 'beautiful' and deserves its name; it has sweet water and is almost the same size as the Tagus.

2. The beauty of Kashmir first described to the Western world by Father Jerome Xavier who accompanied Emperor Akbar to the province[2]

…the Kingdom of Caxmir is one of the pleasantest and most beautiful countries to be found in the whole of India, we may even say in the East.

3. Kashmir "surpasses in beauty all that my warm imagination had anticipated," Francois Bernier[3]

The histories of the ancient Kings of *Kachemire* maintain the whole of this country was in former times one vast lake, and that an outlet for the waters was opened by a certain pire, or aged saint, named *Kacheb* [Persian form of Kasyapa, son of Marichi, son of Brahma, who according to Hindu tradition, formed the passage], who miraculously cut the mountain of *Baramoule*...

Kachemire, however, is no longer a lake, but a beautiful country, diversified with a great many low hills: about thirty leagues in length, and from ten to twelve in breadth. It is situated at the extremity of *Hindoustan,* to the north of *Lahor;* enclosed by the mountains at the foot of *Caucasus,* those of the Kings of *Great Tibet* [Ladakh] and *Little Tibet* [Baltistan], and of the *Raja Gamon* [Raja of Jummoo], who are its most immediate neighbours.

The first mountains which surround it, I mean those nearest to the plains, are of moderate height, of the freshest verdure, decked with trees and covered with pasture land, on which cows, sheep, goats, horses, and every kind of cattle is seen to graze. Game of various species is in great plenty – partridges, hares, antelopes, and those animals which yield musk. Bees are also in vast abundance; and what may be considered very extraordinary in the *Indies,* there are, with few or no exceptions, neither serpents, tigers,

bears, nor lions. These mountains may indeed be characterised not only as innocuous, but as flowing in rich exuberance with milk and honey.

Beyond the mountains just described arise others of very considerable altitude, whose summits, at all times covered with snow, soar above the clouds and ordinary mist, and, like *Mount Olympus,* are constantly bright and serene.

From the sides of all these mountains gush forth innumerable springs and streams of water, which are conducted by means of embanked earthen channels even to the top of the numerous hillocks [these table-lands, called *karewas*, are a prominent feature of the landscape] in the valley; thereby enabling the inhabitants to irrigate their fields of rice. These waters, after separating into a thousand rivulets and producing a thousand cascades through this charming country, at length collect and form a beautiful river [the Jhelum], navigable for vessels as large as are borne on our *Seine.* It winds gently around the kingdom, and passing through the capital, bends its peaceful course toward *Baramoule,* where it finds an outlet between two steep rocks, being then joined by several smaller rivers from the mountains, and dashing over precipices it flows in the direction of Atek [Attock, Bernier seems to have been misinformed; the Jhelum falls into the Chenab near Jhang; the general direction is correct], and joins the *Indus.*

The numberless streams which issue from the mountains maintain the valley and the hillocks in the most delightful verdure. The whole kingdom wears the appearance of a fertile and highly cultivated garden. Villages and hamlets are frequently seen through the luxuriant foliage. Meadows and vineyards, fields of rice, wheat, hemp, saffron, and many sorts of vegetables, among which are intermingled trenches filled with water, rivulets, canals, and several small lakes, vary the enchanting scene. The whole ground is enamelled with our European flowers and plants, and covered with our *apple, pear, plum, apricot,* and *walnut trees,* all bearing fruit in great abundance. The private gardens are full of *melons, pateques* or *water melons, water parsnips, red beet, radishes,* most of our potherbs, and others with which we are unacquainted…

Capital of Kashmir

The capital of *Kachemire* bears the same name as the kingdom [Srinagar, the ancient name of the city, was disused during Muhammedan rule]. It is

without walls and is not less than three quarters of a league in length, and half a league in breadth. It is situated in a plain, distant about two leagues from the mountains, which seem to describe a semicircle, and is built on the banks of a freshwater lake [the Dal Lake], whose circumference is from four to five leagues. This lake is formed of live springs and of streams descending from the mountains, and communicates with the river, which runs through the town, by means of a canal sufficiently large to admit boats. In the town there are two wooden bridges thrown over the river; and the houses, although for the most part of wood, are well built and consist of two or three stories. There is, however, plenty of very fine freestone in the country; some old buildings, and a great number of ancient idol-temples in ruins, are of stone; but wood is preferred on account of its cheapness, and the facility with which it is brought from the mountains by means of so many small rivers. Most of the houses along the banks of the river have little gardens, which produce a very pretty effect, especially in the spring and summer, when many parties of pleasure take place on the water. Indeed most houses in the city have also their gardens; and many have a canal, on which the owner keeps a pleasure-boat, thus communicating with the lake.

Hari Parbat

At one end of the town appears an isolated hill, with handsome houses on its declivity, each having a garden. Toward the summit are a *Mosque* and *Hermitage,* both good buildings; and the hill is crowned with a large quantity of fine trees. It forms altogether an agreeable object, and from its trees and gardens it is called, in the of language of the country, *Haryperbet* [Hari Parbat] or the Verdant Mountain.

Buddhist temple built by Emperor Ashoka's son

Opposite to this hill is seen another, on which is also erected a small *Mosque* with a garden and an extremely ancient building, which bears evident marks of having been a temple for idols, although named *Tact-Souliman* [the Takht-i Suliman hill on top of which is a Buddhist temple built by Jaloka, son of Emperor Ashoka; part of it was converted into a mosque at the time of a Muslim invasion of Kashmir], the Throne of Solomon. The *Mahometans* pretend it was raised by that celebrated King when he visited *Kachemire;* but I doubt whether they could prove that this country was ever honoured with his presence.

The lake is full of islands, which are so many pleasure-grounds. They look beautiful and green in the midst of the water, being covered with fruit trees, and laid out with regular trellised walks. In general, they are surrounded by the large-leafed aspen, planted at intervals of two feet. The largest of these trees may be clasped in a man's arms, but they are as high as the mast of a ship, and have only a tuft of branches at the top, like the palm-trees.

The declivities of the mountains beyond the lake are crowded with houses and flower-gardens. The air is healthful, and the situation considered most desirable: they abound with springs and streams of water, and command a delightful view of the lake, the islands, and the town.

Shalimar

The most beautiful of all these gardens is one belonging to the King, called *Chah-limar* [Shalimar]. The entrance from the lake is through a spacious canal, bordered with green turf, and running between two rows of poplars. Its length is about five hundred paces, and it leads to a large summer-house placed in the middle of the garden. A second canal, still finer than the first, then conducts you to another summer-house, at the end of the garden. This canal is paved with large blocks of freestone, and its sloping sides are covered with the same. In the middle is a long row of fountains, fifteen paces asunder; besides which there are here and there large circular basins, or reservoirs, out of which arise other fountains, formed into a variety of shapes and figures.

The summer-houses are placed in the midst of the canal, consequently surrounded by water, and between the two rows of large poplars planted on either side. They are built in the form of a dome, and encircled by a gallery, into which four doors open; two looking up, or down, the canal, and two leading to bridges that connect the buildings with both banks. The houses consist of a large room in the centre, and of four smaller apartments, one at each corner. The whole of the interior is painted and gilt, and on the walls of all the chambers are inscribed certain sentences, written in large and beautiful *Persian* characters. The four doors are extremely valuable; being composed of large stones, and supported by two beautiful pillars. The doors and pillars were found in some of the idol temples demolished by *Chah-Jehan,* and it is impossible to estimate their value. I cannot describe the nature of the stone, but it is far superior to porphyry, or any species of

marble [the pillars are believed to be made of a black and grey fossiliferous marble].

Scenic beauty

You have no doubt discovered before this time that I am charmed with *Kachemire.* In truth, the kingdom surpasses in beauty all that my warm imagination had anticipated. It is probably unequalled by any country of the same extent, and should be, as in former ages, the seat of sovereign authority extending its dominion over all the circumjacent mountains even as far as *Tartary* and over the whole of *Hindoustan,* to the island of *Ceylon.* It is not indeed without reason that the *Mogols* call *Kachemire* the terrestrial paradise of the *Indies,* or that *Ekbar* [Akbar] was so unremitting in his efforts to wrest the sceptre from the hand of its native Princes. His son *Jehan-Guyre* [Jahangir] became so enamoured of this little kingdom as to make it the place of his favourite abode, and he often declared that he would rather be deprived of every other province of his mighty empire than lose *Kachemire...*

4. Natural beauty of Bengal, Francois Bernier[4]

In describing the beauty of *Bengale,* it should be remarked that throughout a country extending nearly an hundred *leagues* in length, on both banks of the *Ganges,* from *Raje-Mehale* [Rajmahal] to the sea, is an endless number of channels, cut, in bygone ages, from that river with immense labour, for the conveyance of merchandise and of the water itself, which is reputed by the *Indians* to be superior to any in the world. These channels are lined on both sides with towns and villages, thickly peopled with *Gentiles* [Hindus]; and with extensive fields of *rice, sugar, corn,* three or four sorts of *vegetables, mustard, sesame* for oil, and small *mulberry-trees,* two or three feet in height, for the food of silk-worms. But the most striking and peculiar beauty of *Bengale* is the innumerable islands filling the vast space between the two banks of the *Ganges,* in some places six or seven days' journey asunder. These islands vary in size, but are all extremely fertile, surrounded with wood, and abounding in fruittrees, and pineapples, and covered with verdure; a thousand water-channels run through them, stretching beyond the sight, and resembling long walks arched with trees…

5. The biggest war-tree ever at Aurangabad, Jean de Thevenot[5]

An hour and an halfs march from *Aurangeabad,* we encamped under the biggest *War*-tree, that I have seen in the Indies: It is exceedingly high, hath some branches ten Fathom long, and the circumference of it, is above three hundred of my paces. The branches of it are so loaded with Pigeons, that it were an easie matter to fill a great many Pigeon-houses with them, if one durst take them; but that is forbidden, because they are preserved for the Prince's pleasure. There is a Pagoda under that Tree and many Tombs, and hard by a Garden planted with Citron-trees.

B. Wealth of India

1. Fernao Lopes de Castanheda on luxuriant Goa[6]

The greater part of this island is encircled with rocky cliffs and mires: the land itself is very beautiful and luxuriant with numerous and tall groves of palm trees that give much wine, oil, vinegar, and jaggery, that almost tastes like sugar. It also has areca palms that give areca with which betel is eaten…They have also many gardens in which they grow numerous and very singular fruits of the earth, and have many very healthful waters. They produce much rice and other vegetables which are different from ours and all good to eat. They have a large amount of sesame from which they make a very good oil which spares our own, and it is in such abundance that they make it in presses as we do ours. They produce much livestock, cows and oxen, many pigs and hens, and much good fish, as well as numerous other foods of land and sea.

2. The Deccan, from Belgaum to Bijapur, is 'excellent country' with "many fine streams, large towns, much livestock," the Jesuit, Gonsalves Rodrigues in 1561[7]

The land…is very black and fertile, and very flat. Seldom are stones found in the earth, and it seems to be the most fertile soil imaginable for grains, that is, if it were in the hands of our Portuguese farmers. As it is such excellent land, all foods grow abundantly with only the dews [for moisture].

3. Nature's munificence, Edward Terry[8]

The countrey is beautified with many woods and great varietie of faire goodly trees; but I never saw any there of those kinds which England affoords. Their trees in generall are sappie, which I ascribe to the fatnesse of the soyle. Some of them have leaves as broad as bucklers; others are parted small as ferne, as the tamarine trees, which beare a sowre fruit that growes somewhat like our beanes, most wholesome for to coole and cleanse the bloud. There is one tree amongst them of speciall observation, out of whose branches grow little sprigs downeward till they take root, and so at length prove strong supporters unto the armes that yeeld them; whence it comes to passe that these trees in time grow unto a great height and extend themselves to an incredible bredth [the banyan or Indian fig-tree]. All the trees in those southerne parts of India still keepe on their greene mantles.

For their flowres, they rather delight the eye then affect the sense; in colour admirable, but few of them, unlesse roses and one or two kinds more, that are any whit fragrant.

Ganges water weighs less than any other

This region is watered with many goodly rivers. The two principall are Indus and Ganges. Where this thing remarkable must not passe: that one pinte of the water of Ganges weigheth lesse by an ounce than any in the whole kingdome; and therefore the Mogol, wheresoever hee is, hath it brought to him that he may drinke it…

4. Variety of fruits, Edward Terry[9]

Their fruits are very answerable to the rest; the countrey full of musk-melons, water-melons, pomegranats, pome-citrons [lime], limons, oranges, dates, figs, grapes, plantans (a long round yellow fruit, in taste like to a Norwich peare), mangoes (in shape and colour like to our apricocks, but more luscious), and, to conclude with the best of all, the ananas or pine [pine-apple introduced into India from America by the Portuguese], which seemes to the taster to be a pleasing compound made of strawberries, claret-wine, rose-water, and sugar, well tempered together. In the northermost parts of this empire they have varietie of apples and peares; every where good roots, as carrets, potatoes [according to Sir George Watt, this is the first mention of the ordinary potato in India; it is, however, possible that Terry was referring to the sweet potato, which was common in India at that time], and others like them as pleasant.

5. At Surat, "plants so many, that to write fully of them would require express volumes," Pietro Della Valle[10]

The Commendator of the Dutch came one day to give me a visit, and after a competent conversation, carried me in his coach a little out of the City to see one of the fairest and famousest gardens of Surat. The plot was level, well contriv'd and divided with handsome streight Walks; on either side whereof were planted rowes of sundry Trees of this Climate, namely *Ambe* or, as others speak, *Manghe* [mango], before describ'd by me in my last Letters from *Persia,* in the maritime parts whereof I saw some Trees of this kind: *Foufel,* whose leaves are like these of the *Palm-tree,* but of a livelier, and fairer, green; *Narghil,* like the Palm in the leaves also, and is that which we call *Nux Indica* [coconut]: and others, different from what are found in

our parts. The plots between the several walks were full of herbs and flowers, partly such as we have, and partly not; amongst the rest they shew'd me a Flower, for bigness and form not unlike our Gilly flower, but of a whitish yellow, having a very sweet and vigorous scent, and they call it Ciampa [Champa]. In a convenient place there is a square place [*Baithakhana*, sitting room]; rais'd somewhat from the ground and cover'd with large sheds, to sit there in the shade, after the manner of the East: and here we entertain'd ourselves a while and had a collation; and other things in the garden worthy of remark I saw none.

As for the plants and strange simples of *India,* and the whole Torrid Zone, (in these things very different from ours) I shall say briefly once for all, that they are such and so many, that to write fully of them would require express volumes, and make them as big as those of *Dioscorides* and *Pliny*, all of things unknown to us.

6. Fruits of Goa, Peter Mundy[11]

(i) Jamboes

Jambo trees, which then blossomed, when (and) then I thincke few trees More beautifull to the Eye, the flower of a good bignesse; fine forme and of an excellent vermillion Dye, very thicke sett, growing on the stalkes and biggest bowes, not at the very end of the sprigges as trees Doe bear with us. This fruit is ordinarily now served att our table, in forme like an apple or peare, of a whitish coullour with a Dash of red as some of our apples. It smelles betweene a violett and a rose; of a Pleasaunt tast, though somwhat Flashy [insipid] or waterish.

(ii) Cajooraes: of a straunge propertye

Cajoora trees, whose blossome casteth a Most Fragrant smell into the ayre, the Fruit somwhatt harsh in tast and strong, although it hath this property, thatt I thincke none elce (hath) the like, *viz.* thatt wheras the seedes or Kernells of other fruittes grow within them, the Kernell of this growes quite withoutt it at the very end, resembling a French beane, though much bigger, and beeing roasted, eateth like a Chestnutt.

(iii) Jackes

Jacke trees, whose Fruitte groweth on the very body, stemme, or biggest braunches of the tree. There bee some thatt Wey Near 40 pound waight, and

in my opinion is the biggest Fruit thatt groweth on trees, as I thincke the Cocotree beares the biggest Nutte.

(iv) Coconutts: its wonderfull benefit and use

Cocotrees have onely stemme and No braunches or boughes att all, with a great bush att the very toppe. It is in many places much commended for the great benefitt itt affoards to Mans use, and not undese(r)ved, For to my Knowlidg it affoardes Meat, Drink and lodging, Oyle, Wyne, Milk, Sugar, etts., and good Cordage Made of the outtward rinde of the Nutte, which in Clusters grow outt att the toppe on a sprigge, as Doe allsoe the Papaes in a Manner, the tree Differing in leaves and height.

7. Mango, jack-fruit, and other produce, Niccolao Manucci[12]

As I have promised to speak of the fruits of India, chiefly of the mango and jack-fruit, I may mention that the best mangoes grow in the island of Goa. They have special names, which are as follows: mangoes of *Niculao Affonso, Malaiasses* [? of Malacca], *Carreira branca* [white Carreira], *Carreira vermehla* [red Carreira] of *Conde,* of *Joani Parreira, Babia* (large and round), of *Araup,* of *Porta,* of *Secreta,* of *Mainato,* of *Our Lady,* of *Agua de Lupe.* These are again divided into varieties, with special colour, scent, and flavour. I have eaten many that had the taste of the peaches, plums, pears, and apples of Europe. The mango is a little bit heating and laxative, and however many you eat of them, with or without bread, you still desire to eat more, and they do you no harm. While still unripe they are added to dishes, to pasties, *et cetera.* The juice of the ripe fruit mixed with milk is drunk, and is sustaining. They also make the fruit into preserves, which are exported to various places; various kinds of pickles are also made, which keep good for two years, and the stones are employed in medicine. The tree on which the mango is grown is the size of a walnut-tree; the fruit grows in clusters, like plums in Europe…

Jack-fruit

The jack-fruit I spoke of is of three kinds – *barca, papa,* and *pacheri* jack-fruit. These fruits are very large; some weigh eighty pounds or thereabouts. The tree is of the size of a walnut-tree. The fruit referred to grows on the trunk and on the larger branches; some grow from the roots, and these are discovered by the earth being pushed up, also by the smell which the spot emits. This fruit has a green rind an inch in thickness with projections in the

nature of thorns. It is known to be ripe by the smell it emits. Inside it is full of seeds, somewhat about the size of pears; these are very sweet and on opening them, a juice issues sweet as honey, and in the middle are stones like the chestnuts of Europe. In these jack-fruit the seeds are sometimes white and sometimes red; some are hard, some are soft, and each variety has its special flavour.

Of these seeds mixed with rice-flour they make a kind of fritters, which in India are called *paniara* [balls of rice-flour and sugar]. These, too, have their own flavour. When this fruit [the jack] is cut, a white liquid like bird-lime oozes from the rind, and sticking to the hand, it cannot be removed till it is anointed with oil…

Pineapple

I must mention another fruit found in India called *ananas* [the pineapple], which looks like a large pine-cone of Europe, and it has a corrugated rind. It is necessary to slice off this rind somewhat thickly to get rid of some natural depressions it has in it. The centre, when eaten, has a sweet, slightly acid, but very pleasant flavour. This fruit is heating, and if you leave a knife in it all night, the next day you will find it bitten into as if it had remained in aqua fortis. The distilled juice of this fruit is useful for dissolving stones in the kidneys and bladder, as I have found by experiment. The plant on which the fruit forms is a cubit in height; it grows up like an ear of corn, each plant yielding no more than one fruit. The leaves are a cubit in length and two fingers in breadth, with prickly edges. In no part of India have I seen them in such quantities as in Bengal, where they were large and fine. The reason for this is that it is a lowlying and humid country.

Mirobolanos quebulos

In the Mogul kingdom at different places, such as in the province of Gujarat, the mountains of Srinagar [? Garhwal], and of Butando [? Bhutan], grows a wild fruit exported from India to Europe. They are called *Mirobolanos quebulos* [Chebuli Myrobalan], and are used in medicine. Among them, though rarely, are found some of greater size than the others; these, if attached to the hand, are mildly purgative. They are valued for having this virtue, and great nobles give large sums to obtain them.

Chick-pea

In Hindustan they also sow a grain that in Italian is called *cheche* [? C*ece*] and in French *puee* [? *Pois*]. Of this grain I have seen large quantities used in Europe, chiefly on ship-board. Upon this plant when it is green there collects a dew which is very acid. The great nobles use this liquid instead of vinegar; and to gather it men go out before sunrise and run a sheet over the plants until it is thoroughly steeped. The liquid is then wrung out and kept in well-closed bottles. I state this because in Europe I have neither seen nor heard of such a thing….

Coco-tree

There can be no doubt that something curious can be written about a tree which generally grows in India near the sea. It is called palm-tree or coco-tree. This tree has many roots about the thickness of the little finger, and it grows to a great height but increases very slowly. When seven years have passed it begins to yield fruit; ordinarily it occupies a circumference of two cubits and three-quarters, there or thereabouts, and it lives for a hundred years. At that age it grows to as much as ten arms length; the stem is straight like the mast of a ship, with the branches or palm-leaves at the summit about two arms in length. The leaves are two cubits long, lying close to one another like organ-pipes, three inches in breadth. In the middle of the leaf is a rib, of which they make brooms, *et cetera,* They also make mats from the branches, and these serve as carpets to the native of the country. They thatch houses with the leaves, and they are also used as decorations at festivals. Every month a new branch appears in the middle of the palm-tree, and the oldest one falls off. Each tree has about thirty branches, and amidst them comes out the flower, enclosed by nature in a shield about a cubit long, nearly ten inches in circumference, and coming to a sharp point. When it has reached its proper size, the covering opens and the flower shows in the shape of brooms. On each branch of the flower you see its fruit stuck on like buttons, and these, swelling until they are like nuts, are then called *coquinhos* [little coconuts]; they are used for many infantile complaints, such as diarrhoea and mouth-sores. When grown to the size of twenty-eight up to thirty inches round, and as much in length, they are called *lanha.* The nut is then full of a sweet water, a drink of which is very refreshing. It is used in inflammation of the liver, the kidneys, and the bladder, and increases urination. It is also good for excessive heat of the

liver, pains in the bowels, or discharges of mucus or of blood; it also refreshes in the season of great heat.

When the nuts have become ripe, the rind hardens outside and the water inside changes into a pulp called *coco,* which lies inside a hard shell that is called *chereta* [*chiratta,* in Malayalam for the shell of the coconut]*,* and is like a nut. When the rind has been drawn off, they use it to make ropes and cables. The *coco,* when out of its husk, has sixteen to twenty thumbs *(pollegadas),* which European physicians call *Nos Indica* [Indian nut]. From the shells *(chereta* or *chiratta)* of these *cocos* are made dishes *(porzulanos),* vessels, spoons, handles, rings, rosaries, buckets to draw water, and many curiosities. The substance inside, which has about the thickness of an inch, is used for many dainties, being added to dishes in cooking. An oil is also made and usually applied by the women to their hair, which is their greatest delight. This oil is also employed for many medicinal purposes, such as in burns and ulcers, and an ointment is made with it. It serves for a purge to the lean and irascible, expels bile, and reduces adipose tissue.

Usually these trees yield four or five flowers, and in each flower are contained fifteen to twenty *cocos*. Every year it produces fruit three or four times, according to the strength of the soil; in Goa I have seen it yield four crops.

Toddy

Having finished talking of the palm-tree's fruit, I will now speak of its juice, called by the Indians *sura* [toddy]. When they want to draw the liquid, it is first necessary to open the flower, it being then in its rind; the end is cut, and then they begin to depress the whole flower in order to collect the juice, and fixing it, they attach to the end an earthen cup into which the substance drips. This is done twice a day, and each flower yields each time twenty ounces, more or less, of the distillation. When drunk fresh it is sweet and suave, but kept for twelve hours, it tastes like beer and goes to the head. It is used by the Indians in place of wine. From this liquid are manufactured *agua ardente,* vinegar, and sugar. The Indians ascend and descend these trees by clinging to the trunk and putting round it a rope of fibre, and into its ends they place their feet.

8. Bengal – a very nursing mother

(a) Cesare Federici in 1567 on Sondwip[13]

…the fertilest iland in all the world…[one could obtain there] a sacke of fine Rice for a thing of nothing.

(b) Cesare Federici on the entry of bullion into Bengal[14]

Silver and gold from Pegu [Burma] they carrie to Bengala, and no other kind of Merchandize.

(c) Ralph Fitch on Sonargaon[15]

Great store of Cotton doth goeth from hence, and much Rice, wherewith they serve all India, Ceilon, Pegu, Malacca, Sumatra, and many other places.

(d) Francois Pyrard de Laval on Chittagong[16]

There is such a quantity of rice, that, besides supplying the whole country, it is exported to all parts of India, as well to Goa and Malabar, as to Sumatra, the Moluccas, and all the islands of Sunda, to all of which lands Bengal is a very nursing mother, who supplies them their entire subsistence and food. Thus, one sees arrive there [Chittagong] every day an infinite number of vessels from all parts of India for these provisions.

(e) Bengal more fertile than Egypt, Francois Bernier[17]

Egypt has been represented in every age as the finest and most fruitful country in the world, and even our modern writers deny that there is any other land so peculiarly favoured by nature: but the knowledge I have acquired of *Bengale,* during two visits paid to that kingdom, inclines me to believe that the preeminence ascribed to *Egypt* is rather due to *Bengale.* The latter country produces rice in such abundance that it supplies not only the neighbouring but remote states. It is carried up the *Ganges* as far as *Patna,* and exported by sea to *Maslipatam* and many other ports on the coast of *Koromandel.* It is also sent to foreign kingdoms, principally to the island of *Ceylon* and the *Maldives. Bengale* abounds likewise in sugar, with which it supplies the kingdoms of *Golkonda* and the *Karnatic,* where very little is grown, *Arabia* and *Mesopotamia,* through the towns of *Moka* and *Bassora,* and even *Persia,* by way of *Bender-Abbasi. Bengale* likewise is celebrated for its sweetmeats, especially in places inhabited by *Portuguese,* who are skilful in the art of preparing them, and with whom they are an article of considerable trade. Among other fruits, they preserve large *citrons,* such as we have in *Europe,* a certain delicate root about the length of *sarsaparilla,*

that common fruit of the *Indies* called *amba* [mango], another called *ananas* [pineapple], small *mirobolans* [myrobalans, dried fruits], which are excellent, *limes,* and *ginger.*

(f) Abundance of Bengal, Francois Bernier[18]

The three or four sorts of vegetables which, together with rice and butter [ghee], form the chief food of the common people, are purchased for the merest trifle, and for a single roupie twenty or more good fowls may be bought. Geese and ducks are proportionably cheap. There are also goats and sheep in abundance and pigs are obtained at so low a price that the *Portuguese*, settled in the country, live almost entirely upon pork. This meat is salted at a cheap rate by the *Dutch* and *English*, for the supply of their vessels. Fish of every species, whether fresh or salt, is in the same profusion. In a word, *Bengale* abounds with every necessary of life; and it is this abundance that has induced so many *Portuguese*, *Half-castes*, and other *Christians*, driven from their different settlements by the *Dutch*, to seek an asylum in this fertile kingdom.

(g) Produce of Bengal, Jean de Thevenot[19]

The Countrey is full of Castles and Towns; *Philipatan* [Pipli, near Balasore, Orissa?]*, Satigan* [Satgaon, Hooghly district]*, Patane* [Patna, chief city of Bihar]*, Casanbazar* [Kasimbazaar, Murshidabad district] and *Chatigan* [Chittagong]*,* are very rich; and *Patane* is a very large Town, lying on the West side of the *Ganges* in the Countrey of *Patan,* where the Dutch have a Factory. Corn, Rice, Sugar, Ginger, long Pepper, Cotton and Silk, with several other Commodities, are plentifully produced in that Country, as well as Fruits; and especially the *Ananas,* which in the out side is much like a Pine-Apple; they are as big as Melons, and some of them resemble them also; their colour at first is betwixt a Green and a Yellow, but when they are ripe, the Green is gone; they grow upon a Stalk not above a Foot and a half high; they are pleasant to the taste, and leaves the flavour of an Apricock in the mouth.

9. Produce of Kashmir, Francois Bernier[20]

The merchants who every year travel from mountain to mountain to collect the fine wool with which shawls are manufactured, all agree in saying that between all the mountains still dependent upon *Kachemire* there are many fine stretches of country. Among these tracts there is one whose annual

tribute is paid in leather and wool, and whose women are proverbial for beauty, chastity, and industry. Beyond this tract is another whose valleys are delightful and plains fertile, abounding in corn, rice, apples, pears, apricots, excellent melons, and even grapes, with which good wine is made. The tribute of this tract is likewise paid in wool and leather, and it sometimes happens that the inhabitants, trusting to the inaccessible nature of the country, refuse payment; but troops always contrive to penetrate, and reduce the people to submission.

10. Abundant Lahore, Jean de Thevenot[21]

Lahors is one of the largest and most abundant Provinces of the Indies; the Rivers that are in it render it extreamly fertile, it yields all that is necessary for life; Rice, as well as Corn and Fruits are plentiful there; there is pretty good Wine in it also, and the best Sugars of all *Indostan.* There are in the Towns Manufactures, not only of all sorts of painted Cloaths, but also of every thing else that is wrought in the *Indies*; and indeed, according to the account of my *Indian,* it brings in to the *Great Mogul* above thirty seven Millions a year, which is a great Argument [sign] of its fruitfulness.

11. Spices of South India, Ralph Fitch[22]

The pepper groweth in many parts of India, especially about Cochin; and much of it doeth grow in the fields among the bushes without any labour, and when it is ripe they go and gather it. The shrubbe is like unto our ivy tree; and if it did not run about some tree or pole, it would fall downe and rot. When they first gather it, it is greene; and then they lay it in the sun, and it becommeth blacke. The ginger groweth like unto our garlike, and the root is the ginger. It is to be found in many parts of India.

12. Spices of several kinds, Jean-Baptiste Tavernier[23]

Cardamom, ginger, pepper, nutmegs, mace, cloves, and cinnamon are the several kinds of spices which are known to us. I place cardamom and ginger first, because cardamom grows in the Kingdom of Bijapur and ginger in that of the Great Mogul, while the other kinds of spices are imported from abroad to Surat, where they constitute an important article of commerce.

Cardamom is the best kind of spice, but is very scarce, and as but a small quantity is grown in the place I have indicated, it is only used in Asia at the tables of the nobles. 500 livres of cardamom are sold at from 100 to 110 reals.

Ginger comes in large quantities from Ahmadabad, where it grows in greater abundance than in any other part of Asia, and it is difficult to realise the quantity which is exported in a candied condition to foreign countries.

Pepper is of two kinds, one of small size, and the other much larger; these are respectively known as small and long pepper. The long kind is chiefly from Malabar, Tuticorin, and Calicut being the towns where it is purchased. Some comes also from the Kingdom of Bijapur, and is sold at Rajapur [Ratnagiri district], a small town of that kingdom. The Dutch who purchase it from the Malabaris do not pay for it in cash, but exchange for it many kinds of merchandise, such as cotton, opium, vermilion, and quicksilver, and it is this long pepper which is exported to Europe. As for the small pepper which comes from Bantam, Achin, and other places eastwards, it is not exported from Asia, where much is consumed, especially by the Musalmans. For in a pound of small pepper there are double the number of seeds that there are in a pound of the long; and it is more used in the pulaos, into which it is thrown by the handful, besides which the large pepper is too hot for the mouth ...

There is one remarkable fact about the nutmeg, namely, that the tree is never planted. This has been confirmed to me by many persons who have dwelt for many years in the country. They have assured me that when the nuts are ripe certain birds which arrive from the islands to the south swallow them whole, and reject them afterwards without having digested them, and that these nuts, being covered by a viscous and sticky substance, fall to the ground, take root, and produce trees, which would not happen if they were planted-in the ordinary way…

13. Wealth of India, gold from every part of the world swallowed here, Francois Bernier[24]

It should not escape notice that gold and silver, after circulating in every other quarter of the globe, come at length to be swallowed up, lost in some measure, in *Hindoustan.* Of the quantity drawn from *America,* and dispersed among the different European states, a part finds its way, through various channels, to *Turkey,* for the payment of commodities imported from that country; and a part passes into *Persia,* by way of *Smyrna,* for the silks laden at that port. *Turkey* cannot dispense with the coffee which she receives from *Yemen,* or Arabia Felix; and the productions of the *Indies* are equally necessary to *Turkey, Yemen,* and *Persia.* Thus it happens that these

countries are under the necessity of sending a portion of their gold and silver to *Moka,* on the Red Sea, near *Babel-mandel;* to *Bassora,* at the top of the *Persian Gulf;* and to *Bander Abassi* or *Gomeron*, near *Ormus;* which gold and silver is exported to *Hindoustan* by the vessels that arrive every year, in the *mausem*, or the season of the winds, at those three celebrated ports, laden with goods from that country.

Let it also be borne in mind that all the *Indian* vessels, whether they belong to the *Indians* themselves, or to the *Dutch,* or *English,* or *Portuguese*, which every year carry cargoes of merchandise from *Hindoustan* to *Pegu, Tanasseri* [the southern division of the province of Lower Burma], *Siam*, *Ceylon*, *Achem*, [north of the island Sumatra], *Macassar*, the *Maldives*, to *Mosambic,* and other places, bring back to *Hindoustan* from those countries a large quantity of the precious metals, which share the fate of those brought from *Moka*, *Bassora,* and *Bander-Abassi*. And in regard to the gold and silver which the Dutch draw from *Japan*, where there are mines, a part is, sooner or later, introduced into *Hindoustan*; and whatever is brought directly by sea, either from *Portugal* or from *France*, seldom leaves the country, returns being made in merchandise…

Supplying itself with articles of foreign growth or manufacture, does not… prevent *Hindoustan* from absorbing a large portion of the gold and silver of the world, admitted through a variety of channels, while there is scarcely an opening for its return.

C. Precious metals and stones

The Rammalakota diamond mines, Jean-Baptiste Tavernier[25]

…Rammalakota [in Telugu, "precious stone hill fort"], situated five days journey from Golkonda, and eight or nine from Bijapur... It is only about 200 years since this mine of Rammalakota was discovered, at least so far as I have been able to ascertain from the people of the country.

All round the place where the diamonds are found the soil is sandy, and full of rocks and jungle, somewhat comparable to the neighbourhood of Fontainebleau. There are in these rocks many veins, some of half a finger and some of a whole finger in width; and the miners have small irons, crocked at the ends, which they thrust into the veins to draw from them the sand or earth, which they place in vessels; it is in this earth that they afterwards find the diamonds. But as the veins do not always run straight, as some ascend, while others descend, they are obliged to break the rocks, always following the direction of the veins. After they have opened them out, and have removed the earth or sand which may be in them, they then commence to wash it two or three times, and search it for whatever diamonds it may contain. It is in this mine that the cleanest and whitest-watered diamonds are found; but the evil is that in order to extract the sand more easily from the rocks the miners strike such blows with a heavy iron crowbar that it fractures the diamonds, and gives rise to flaws. This is the reason why so many thin stones come from this mine, for when the miners see a stone in which there is a flaw of some size, they immediately cleave it, that is to say split it, at which they are much more accomplished than we are. These are the stones which we call thin *(foible),* which make a great show. If the stone is clean they do not do more than just touch it with the wheel above and below, and do not venture to give it any form, for fear of reducing the weight. But if it has a small flaw, or any spots, or small black or red grit, they cover the whole of the stone with facettes in order that its defects may not be seen, and if it has a very small flaw they conceal it by the edge of one of the facettes. But it should be remarked that the merchant prefers a black point in a stone to a red one. When there is a red one the stone is roasted and the point becomes black….

D. Fauna

1. Elephants

(a) Used in battles, Ludovico Di Varthema[26]

…It occurs to me here to touch upon a subject worthy of notice, viz. the discretion, the intelligence, and the strength of the elephant. We will first say in what manner he fights. When an elephant goes into battle he carries a saddle, in the same manner as they are borne by the mules of the kingdom of Naples, fastened underneath by two iron chains. On each side of the said saddle he carries a large and very strong wooden box, and in each box there go three men. On the neck of the elephant, between the boxes, they place a plank the size of half a span, and between the boxes and the plank a man sits astride who speaks to the elephant, for the said elephant possesses more intelligence than any other animal in the world; so that there are in all seven persons who go upon the said elephant; and they go armed with shirts of mail, and with bows and lances, swords and shields. And in like manner they arm the elephant with mail, especially the head and the trunk. They fasten to the trunk a sword two *braccia* long, as thick and as wide as the hand of a man. And in that way they fight. And he who sits upon his neck orders him: 'Go forward' or 'Turn back,' 'Strike this one,' 'Strike that one,' 'Do not strike any more,' and he understands as though he were a human being. But if any time they are put to flight it is impossible to restrain them; for this race of people are great masters of the art of making fireworks, and these animals have a great dread of fire, and through this means they sometimes take to flight. But in every way this animal is the most discreet in the world and the most powerful.

(b) Most docile creatures, Edward Terry[27]

They have many elephants; the King for his owne particular being master of fourteene thousand, and his nobles and all men of qualitie in the countrey have more or lesse of them, some to the number of one hundred. The elephants, though they bee the largest of all creatures the earth brings forth, yet are so tractable (unlesse at times when they are mad) that a little boy is able to rule the biggest of them. Some of them I have seene thirteene foot high; but there are among them (as I have beene often told) fifteene at the least. The colour of them all is black; their skins thick and smooth without haire. They take much delight to bathe themselves in water, and swim better

then any beast I know. They lye downe and arise againe at pleasure, as other beasts doe. Their pace is not swift, about three mile an houre; but of all beasts in the world are most sure of foot, for they never fall nor stumble to endanger their rider. They are most docile creatures and, of all those we account meerely sensible, come neerest unto reason. Lipsius [Justus Lipsius, Joest Lips, the Dutch humanist, 1547-1606] in his *Epistles* (1 *Cent. Epist.* 50) out of his observations from others writes more of them then I can confirme, or any (I perswade my selfe) beleeve; yet many things remarkable, which seeme indeed acts of reason rather then sence, I have observed in them. For instance, an elephant will doe any thing almost that his keeper commands him; as, if he would have him affright a man, he will make towards him as if hee would tread him in pieces, and when he is come at him, doe him no hurt; if he would have him to abuse or disgrace a man, he will take dirt or kennell water in his trunke and dash it in his face. Their trunks are long grisselly snouts hanging downe twixt their teeth, by some called their hand, which they make use of upon all occasions.

(c) Mode of hunting elephants, Niccolao Manucci[28]

The mode of hunting the elephant is in Cochin as follows: They make large pits on the paths over which the animal pass, as recognised by their footmarks. Then they put sticks, straw, and earth over these pits, so that the elephant cannot discover them. Passing from one place to another, they fall into the pit, and there they are left for some days, giving them very little food. On finding that from hunger the animal is more gentle, they begin little by little to fill up the pit to a height which enables a man to mount on the elephant. Its feet are bound by heavy iron chains; then, in company of domesticated elephants, it is removed somewhere else, after which it readily becomes submissive…

Intelligence of elephants

Usually there are some superstitions involved in these hunts. It happened in Cochin that an elephant fell into one of the pits described, but was able somehow to get out. To preserve himself and not fall in another time, he began to carry a stake in his trunk with which he probed the earth where he wanted to go. Thus these animals have great discernment, as I have seen and experienced.

2. Taming lions at Sidhpur [Chitpur], Jean-Baptiste Tavernier[29]

Sidhpur is a fairly good town, so named on account of the great trade which it does in those coloured cottons which are called chites, and at four or five hundred paces on the south side there flows a small river. When I arrived at Sidhpur, on one of my journeys, I was encamped under two or three trees at one of the ends of a great open space near the town. A short time afterwards four or five lions appeared which they brought to train, and they told me it generally took five or six months, and they do it in this way. They tie the lions, at twelve paces distance from each other, by their hind feet, to a cord attached to a large wooden post firmly planted in the ground, and they have another about the neck which the lion-master holds in his hand. These posts are planted in a straight line, and upon another parallel one, from fifteen to twenty paces distant, they stretch another cord of the length of the space which the lions occupy, when arranged as above. These two cords which hold the lion fastened by his two hind feet, permit him to rush up to this long cord, which serves as a limit to those outside it, beyond which they ought not to venture to pass when harassing and irritating the lions by throwing small stones or little bits of wood at them. A number of people come to this spectacle, and when the provoked lion jumps towards the cord, he has another round his neck, which the master holds in his hand, and with which he pulls him back. It is by this means that they accustom the lion by degrees to become tame with people, and on my arrival at Sidhpur I witnessed this spectacle without leaving my carriage.

People

A. Description of people

B. Glimpses of society

C. Dwellings

D. Dress

E. Cleanliness

F. Food habits, mode of eating, fasts

G. Betel eating

H. Economic disparities

I. Funeral Rites

A. Description of people

1. Reverence for teachers among Nayars, Tome Pires[1]

They always make a deep reverence to the masters who teach them, so much so that if the best of the Nayars were to meet a Mukkuvan *(Macua)* [a caste name applied to fishermen of Malabar coast] who happened to have taught him something, he would make him a reverence and then go and wash himself. If a Nayar meets another older than himself on the road, he does him reverence and gives place to him. If there were two, three or four brothers, the oldest would have to be seated while the others remained standing.

2. People at Goa, letter dated 10 November 1579 by Thomas Stevens of the Society of Jesus to his father on landing[2]

The people be tawny, but not disfigured in their lips and noses, as the Moors and Cafres of Ethiopia. They that be not of reputation – or, at least, the most part – go naked, saving an apron of a span long and as much in breadth before them, and a lace two fingers broad before them girded about with a string, and no more. And thus they think themselves as well as we with all our trimming.

3. Polished and refined, Francois Pyrad de Laval[3]

I have never seen men of wit so fine and polished as are these Indians: they have nothing barbarous or savage about them, as we are apt to suppose. They are unwilling indeed to adopt the manners and customs of the Portuguese; yet do they readily learn their manufactures and workmanship, being all very curious and desirous of learning. In fact the Portuguese take and learn more from them than they from the Portuguese…

4. Hindus talented and industrious, Edward Terry[4]

The Gentiles for the most part are very industrious. They till the ground or else spend their time otherwaies diligently in their vocations. There are amongst them most curious artificers, who are the best apes for imitation in the world; for they will make any new thing by patterne. The Mahometans are generally idle; who are all for to morrow (a word common in their mouthes). They live upon the labours of the Gentiles.

5. Loyal followers, Edward Terry[5]

I must needes commend the Mahumetans and Gentiles for their good and faithfull service; amongst whom a stranger may travell alone, with a great charge of money or goods, quite through the countrey and take them for his guard, yet never bee neglected or injured by them. They follow their masters on foote, carrying swords and bucklers or bowes and arrowes for their defence; and by reason of great plentie of provision in that kingdome, a man may hire them upon easie conditions, for they will not desire above five shillings the moone, paide the next day after the change (*Quibus hinc toga, calceus hinc est; et panis fumusque domi)* ["Their coat, their shooes, their bread, their fire, And all besides, bought with this hire"], to provide themselves all necessaries, and for it doe most diligent service.

6. Hindu morality – adultery, slavery, sodomy frowned upon, Pietro Della Valle[6]

As for good works and sins, they all agree with the Doctrine of Morality and the universal consent of Mankind, that there are differences of Virtue and Vice in all the world. They hold not onely Adultery, but even simple Fornication, a great sin; nor do they account it lawful, as the Mahometans do, to have commerce with female slaves, or with others besides their own Wives. Yea, slaves of either sex they no-wise admit, but hold it a sin; making use of free persons for their service, and paying them wages, as we do in *Europe*. Which likewise was their ancient custom, as appears by *Strabo,* who cites *Megasthenes* and other Authors of those times for it. They detest Sodomy above measure, and abhor the Mahometans whom they observe addicted to it. They take but one Wife and never divorce her till death, except for the cause of Adultery. Indeed some, either by reason of the remoteness of their Wives, or out of a desire to have children in case the first Wife be barren, or because they are rich and potent, and are minded to do what none can forbid them, sometimes take more Wives; but 'tis not counted well done, unless they be Princes, who always in all Nations are privileged in many things. When the Wife dyes they marry another if they please; but if the Husband dye the Woman never marries more; were she so minded, nor could she find any of her own Race who would take her, because she would be accounted as bad as infamous in desiring a second Marriage. A very hard Law indeed…

7. Ethics and war rules, the Zomorin/Cochin conflict, Pietro Della Valle[7]

When two Kings happen to war together each Army takes great heed not to kill the opposing King, nor so much as to strike his Umbrella wherever it goes, which is amongst them the Ensign of Royalty, because, besides that it would be a great sin to have a hand in shedding Royal blood, the party, or side, which should kill, or wound, him would expose themselves to great and irreparable mischiefs, in regard of the obligation that the whole Kingdom of the wounded, or slain, King hath to revenge him with the greatest destruction of their enemies, even with the certain loss of their own lives if it be needful. By how much such Kings are of greater dignity among them so much longer this obligation of furious revenge endureth. So that if the *Samori* [Zamorin] should be killed, or wounded, by the Army of the King of *Cocin,* who is his enemy, but of greater dignity, the people of the *Samori* stand obliged to one day of revenge, (others say three days) during which everyone is obliged to act his utmost to the utter destruction of those of *Cocin,* even with the manifest hazard of his own life. But if the King of *Cocin,* who hath a greater repute, for honour at least, if not for power, should happen to be slain, or wounded, by the people of the *Samori,* the fury of revenge is to last in those of *Cocin* all the time of their lives (others say once a year), which would cause a great destruction of both sides. They call this term of time, or manner of revenge, *Amoco;* so that they say the *Amoco* of the *Samori* lasts one day; the *Amoco* of the King of *Cocin* lasts all the life, and so of others.

8. Devotion to priests, Jean-Baptiste Tavernier[8]

When I was at Agra in the year 1642 a somewhat strange thing happened. An idolater called Voldas [Vithaldas?] who was the Dutch broker, and about seventy years old, received news that the Chief Priest of the pagoda of Mathura was dead. Immediately he went to see the Chief of the Dutch factory to ask him to examine his accounts and close them, because as he said, their Chief Priest being dead he also wished to die, to serve that holy man in the other world. As soon as his accounts had been examined he entered his carriage accompanied by some relatives who followed him, and as he had neither eaten nor drunk since he had received the news, he died on the road, refusing to take any food.

9. Salutations of the Hindus, Niccolao Manucci[9]

The first error of these Hindus is to believe that they are the only people in the world who have any polite manners; and the same is the case with

cleanliness and orderliness in business. They think all other nations, and above all Europeans, are barbarous, despicable, filthy, and devoid of order.

The civilities they pay to each other are as follows, divisible into five categories. In the first they raise the hands to the head and prostrate themselves on the ground; this is the form in which they adore God, and salute their spiritual leaders, the *Sannyasis,* who are their monks and they also employ it for kings, princes, and the great. Although this is practised by nearly every caste, it is not observed by the Brahmans; they prostrate themselves only before God, their teachers, who are always Brahmans, and their monks, also invariably of their own caste.

The second manner of salutation is to lift the hands to the head. It is in this fashion that they salute ordinary persons, governors, generals, and ministers of kings and princes. The third manner is to raise the hands only as high as the stomach; and this is the course adopted by equals and friends, followed by an embrace. The fourth manner is to display the two hands with the palms joined. This is done by the learned and by monks before princes and the great, when those persons make use to them of one of the three methods above described. Finally the fifth and last mode of salutation is to display the palm of the right hand raised on high; this is how superiors act to inferiors.

Brahmans salute kings in the second manner only; and to it the latter respond in the same form. But what is delightful is to see a Brahman on a visit to another man, for without the slightest salutation he seats himself, and in the conversation the host accords him the title of lordship or excellency, and often that of highness. When he takes his leave he goes off most solemnly without being any more polite on going away than on entering.

10. Hindu opinion of foreigners, Niccolao Manucci[10]

The Hindus call all the Europeans and Mahomedans in India by the name of *Farangis* [the inclusion of Mahomedans among Farangis is debatable], a designation so low, so disgraceful in their tongue, that there is nothing in ours which could reproduce it. As they hold the Farangis to be vile and abominable they have persuaded themselves that people have no polite manners, that they are ignorant, wanting in ordered life, and very dirty. For these things they would sooner die unaided than drink a cup of water from

the hand of a *Farangi;* nor would they eat anything that he has prepared. They believe such an act to be an irremediable disgrace, and a sin for which there is no remission.

11. Description of Indians, Giovanni Careri[11]

The *Indians* are well shap'd, it being rare to find any of them crooked, and for Stature like the *Europeans*. They have black Hair but not Curl'd, and their Skin is of an Olive Colour; and they do not love White, saying it is the Colour of Leprousie. They wash often, anointing themselves after it with rich Oyls and Oyntments.

12. Indian ingenuity, J. Ovington[12]

The *Indians* are in many things of matchless Ingenuity in their several Imployments, and admirable Mimicks of whatever they affect to copy after. The *Bannian*, by the Strength of his Brain only, will sum up his Accounts with equal exactness, and quicker Dispatch, than the readiest Arithmetician can with his Pen. The Weavers of Silk will exactly imitate the nicest and most beautiful Patterns that are brought from *Europe*. And the very Ship-Carpenters at *Suratt* will take the Model of any *English* Vessel, in all Curiosity of its Building, and the most artificial Instances of Workmanship about it, whether they are proper for the Convenience of Burthen, or of quick Sailing, as exactly as if they had been the first Contrivers.

13. Holy ballads sung all day, J. Ovington[13]

The Pagans, who are bred to labour and Manual Occupations, consecrate each Day of the Week, and everything they take in Hand thus far; that they fill their Mouths with a pious Song at the first dawning of the Morning, as soon as ever they ingage in their several Employments and Manual Occupations, and never cease their Secular Vocation without concluding with the mixture of a Holy Rhime. When a Company of Labourers are employ'd together about the same Work, this sacred Ballad is repeated by them sometimes alternately, sometimes by single persons, the rest answering in Chorus, all the Day long, without the intermission of one quarter of an Hour.

B. Glimpses of society

1. Hindus at Goa, Tome Pires[14]

There are a great many heathens in this kingdom of Goa, more than in the kingdom of the Deccan. Some of them are very honoured men with large fortunes; and almost the whole kingdom lies in their hands, because they are natives and possess the land and they pay the taxes. Some of them are noblemen with many followers and lands of their own, and are persons of great repute, and wealthy, and they live on their estates, which are very gay and fresh. The heathens of the kingdom of Goa surpass those of Cambay. They have beautiful temples of their own in this kingdom; they have priests or Brahmans of many kinds. There are some very honoured stock among these Brahmans. Some of them will not eat anything which has contained blood or anything prepared by the hand of another. These Brahmans are greatly revered throughout the country, particularly among the heathen… They are clever, prudent, learned in their religion. A Brahman would not become a Mohammedan [even] if he were made a king.

2. Hindu society in Malabar, Camoes in the *Lusiads,* 1572[15]

The Law that holds the people, high and low,
is fraught with false phantastick tales long past:
they go unclothed, but a wrap they throw
for decent purpose round the loins and waist:
Two modes of men are known; the nobles know
the name of Nayrs, who call the lower caste
Poleas, whom their haughty laws contain
from intermingling with the higher strain:
For men who aye had office in one guise
with mates of other office ne'er may wive;
nor may the son the calling exercise
save sire's and foresires' long as he shall live.
These Nayrs as sin and shame, forsooth, despise

the touch of outcasts, and they fain believe
that, peradventure, if the touch occur,
a thousand rites must wash their bodies pure.
In sim'ilar form the Judaean folk of old
touch'd not the peoples of Samaria-reign:
But strangenesses far stranger than I've told
of varied usages shall meet your eyne.
None save the Nayrs affront the manifold
chances of war, who like stone-wall sustain
their King from enemies, arms aye in hand,
in left the target, and in right the brand.
Entitled Brahmins are their ghostly race,
time-honour'd title of high eminence:
His far-famed precepts, eke, they still embrace
who first to Science lent a modest sense:
A living thing to kill they hold as base,
such be from ev'ery flesh their abstinence:
Only in joys venereal their delight
hath more of licence and laxer rite.
Common the women are, although confine'd
to those belonging to their husbands' blood:
Happy condition ! happy humankind,
who over jealous wrongs may never brood !
These and more customs various shall ye find
among the Mal'abar men still holding good:
Great is the country, rich in ev'ery style
of goods from China sent by sea to Nyle.

3. The Deccanis, Jan Huygen van Linschoten[16]

The Canaras and *Decanyns* are of the Country of *Decam,* commonly called *Ballagate,* lying behind Goa: many of them dwell in *Goa.* Their apparel is like the *Gusurates* and *Benianes,* except their Shooes which they weare like Antiques with cut toes, and fastned above upon their naked feet which they call *Alparcas.* They weare their Beards and haire long, as it groweth without cutting, but onely turne it vp, and dresse it as the *Benianes* and *Bramenes* vse to doe, and are like them for colour, forme, and making. They eate all things except Kine, Hogges, and Buffles, Flesh and Fish. They account the Oxe, Kow or Buffle to bee Holie, which they have commonly in the house with them, and they besmeere, stroke, and handle them with all the friendship in the world, and feed them with the same meat they vse to eate themselues. In the night time they sleepe with them in their Houses, and to conclude, use them as if they were reasonable Creatures, whereby they thinke to doe God great service. In their Eating; sitting in the House, Washing, making Cleane and other Ceremonies and Superstitions they are altogether like the *Bramenes, Gusurates,* and *Benianes.*

4. The Canarijns and Corumbijns, Jan Huygen van Linschoten[17]

The *Canarijns* and *Corumbijns* are the Countrimen, and such as deale with Tilling the Land, Fishing and such like labours. These are the most contemptible, and the miserablest people of all *India,* and live very poorly, maintaining themselves with little meat. They eate all kind of things, except Kine, Oxen, Buffles, Hogges, and Hens flesh; their Religion is like the *Decanijns* and *Canaras,* for they are all of one Countrey and Custome, little differing: they goe naked, their middle onely covered with a cloth. The Women goe with a cloth bound about their middle beneath their nauels, and hanging downe to the middle of their thighes, and the other end thereof they cast ouer their shoulders, whereby half their brests are covered. They are in a manner blacke, or of a darke browne colour, many of them are *Christians,* because their chiefs habitation and dwelling places are on the Sea-side, in the Countries bordering upon *Goa,* for that the Palme trees doe grow vpon the Sea coasts, or upon the banks by Riuer sides. The Rice is sowed vpon low ground, which in Winter time is covered with water, wherewith those *Canarijns* doe maintaine themselves: these bring Hennes, Fruit, Milke, Egges, and other such like wares into the Towne to sell. They dwell in little straw Houses, the doores whereof are so low, that men must creepe in and out, their houshold-stuffe is a Mat upon the ground to sleepe vpon, and a Pit

or hole in the ground to beat their Rice in, with a Pot or two to seeth it in, and so they live and gaine so much as it is a wonder. For commonly their Houses are full of small Children, which crall and creepe about all naked, vntill they are seven or eight yeares old, and then they cover their middle. When the women are readie to trauell with Child, they are commonly delivered when they are all alone, and their Husbands in the fields.

5. Customs in Telengana, Jean de Thevenot[18]

No where are the Gentiles more Superstitious than here; they have a great many Pagods with Figures of Monsters, that can excite nothing but Horror instead of Devotion, unless in those who are deluded with the Religion. These Idolaters use frequent Washings; Men, Women and Children go to the River as soon as they are out of Bed; and the rich have Water brought them to wash in. When Women lose their Husbands, they are conducted thither by their Friends, who comfort them; and they who are brought to Bed, use the same custom, almost as soon as they are delivered of their Children, and indeed, there is no Countrey where Women are so easily brought to Bed; when they come out of the Water, a *Bramen* dawbs their Fore-head with a Composition made of Saffron, and the Powder of white Sawnders [sandalwood] dissolved in Water, then they return home, where they eat a slight Breakfast; and seeing they must never eat unless they be washed, some return to the *Tanquie* or River, about noon; and others perform their Ablutions at home, before they go to Dinner.

As they have a special care not to eat any thing but what is dressed by a Gentile of their Caste, so they seldom eat any where but at home, and commonly they dress their Victuals themselves, buying their Flower, Rice, and such other Provisions in the Shops of the *Banians*, for they'll not buy any where else.

These *Banians* (as well as the *Bramens* and *Courmis*) feed on Butter, Pulse, Herbs, Sugar and Fruit; they eat neither Fish nor Flesh, and drink nothing but Water, wherein they put Coffee and Tea; they use no dishes, for fear some body of another Religion or Tribe, may have made use of the Dish, out of which they might eat; and to supply that, they put their Victuals into large Leaves of Trees, which they throw away when they are empty, nay, there are some of them who eat alone, and will not suffer neither their Wives nor Children at Table with them...

Professions followed by Hindus

6. Gujaratis excel as seamen, Tome Pires[19]

The Gujaratees were better seamen and did more navigating than the other people of these parts and so they have larger ships and more men to man them. They have great pilots and do a great deal of navigation. The heathen of Cambay – and in older times the Gujaratees – held that they must never kill anyone, nor must they have an armed man in their company. If they were captured and [their captors] wanted to kill them all, they did not resist. This is the Gujarat law among the heathen. Now they have many men-at-arms to defend their ships.

7. Leading merchants, jewellers, workmen, brokers, Francisco Pelsaert[20]

The Hindus…have three ordinary sources of livelihood. First there are the leading merchants and jewellers, and they are most able and expert in their business. Next there are the workmen, for practically all work as is done by Hindus, the Moslems practising scarcely any crafts but dyeing and weaving, which are followed by Hindus in some places, but by Moslems everywhere.

Thirdly there are the clerks and brokers: all the business of the lords' palaces and of the Moslem merchants is done by Hindus book-keeping, buying, and selling. They are particularly clever brokers, and are consequently generally employed as such throughout all these countries, except for the sale of horses, oxen, camels, elephants, or any living creatures, which they will not handle as the Moslems do.

C. Dwellings

1. Houses of the rich, use of local materials makes them pleasant, Francisco Pelsaert[21]

…I shall now speak of the houses which are built here. They are noble and pleasant, with many apartments, but there is not much in the way of an upper story except a flat roof, on which to enjoy the evening air. There are usually gardens and tanks inside the house; and in the hot weather the tanks are filled daily with fresh water, drawn by oxen from wells. The water is drawn, or sometimes raised by a wheel, in such quantity that it flows through a leaden pipe and rises like a fountain; in this climate water and plants are a refreshment and recreation unknown in our cold country. These houses last for a few years only, because the walls are built with mud instead of mortar, but the white plaster of the walls is very noteworthy, and far superior to anything in our country. They use unslaked lime, which is mixed with milk, gum, and sugar into a thin paste. When the walls have been plastered with lime, they apply this paste, rubbing it with well-designed trowels until it is smooth; then they polish it steadily with agates, perhaps for a whole day, until it is dry and hard, and shines like alabaster, or can even be used as a looking-glass.

2. Abode of common people, Niccolao Manucci[22]

Their dwellings also are very small. Excluding the temples of their false gods, some of which cost great sums, and the palaces of a few kings, princes, *et cetera,* which are built of brick and mortar, and even then have no architectural style, all other houses are constructed of earth and pieces of wood bound together with ropes, without much regard to appearances. These wooden posts serve as supporting pillars, and the roof is of thatch. In this way they build a house without using a single nail. The floors of the houses are not stone-paved, nor covered with the sort of cement they make in this country of lime, eggs, and other ingredients mixed together. The floors are of pounded earth only, spread over with a wash of cow's dung. This is the bed of the great majority of humble people in this country, who have no other mattress to lie on. However, rich people have a mat or a quilt on which they sleep; and those that possess this much believe themselves in possession of one of the greatest luxuries in the world.

3. Dwellings in Bengal, Fray Sebastian Manrique[23]

This people usually live in huts of mud and clay, low and thatched with straw or olas, which is the leaf of a palm. They keep their dwellings very clean, usually scouring them over constantly with the excrement of cattle dung mixed with mud…

D. Dress

1. Dress of heathens at Vijayanagar, Duarte Barbosa[24]

The natives of this land are Heathen like himself [the king]; they are tawny men, nearly white. Their hair is long, straight and black. The men are of good height with 'physnomies' like our own: the women go very trimly clad; their men wear certain clothes as a girdle below, would very tightly in many folds, and short white shirts of cotton or silk or coarse brocade, which are gathered between the thighs but open in front: on their heads they carry small turbans, and some wear silk or brocade caps, they wear their rough shoes on their feet (without stockings). They wear also other large garments thrown over their shoulders like capes, and are accompanied by pages walking behind them with their swords in their hands. The substances with which they are always anointed are these: white sanders-wood [sandal-wood], aloes, camphor, musk, and saffron, all ground fine and kneaded with rosewater. With these they anoint themselves after bathing, and so they are always very highly scented. They wear many rings set with precious stones and many earrings set with fine pearls in their ears. As well as the page armed with a sword, whom, as I have said, they take with them, they take also another who holds an umbrella (lit. a shade-hat with a handle) to shade them and to keep off the rain, and of these some are made of finely worked silk with many golden tassels, and many precious stones and seed-pearls. They are so made as to open and shut, and many cost three of four hundred cruzados.

2. Women's dress at Vijayanagar, Duarte Barbosa[25]

The women wear white garments of very thin cotton, or silk of bright colours, five yards long: one part of which is girt round them below, and the other part they throw over one shoulder and across their breasts in such a way that one arm and shoulder remains uncovered, as with a scarf (*reguacho*). They wear leather shoes well embroidered in silk; their heads are uncovered and the hair is tightly gathered into a becoming knot on the top of the head, and in their hair they put many scented flowers. In the side of one of the nostrils they make a small hole, through which they put a fine gold wire with a pearl, sapphire or ruby pendant. They have their ears bored as well, and in them they wear earrings set with many jewels; on their necks they wear necklaces of gold and jewels and very fine coral beads, and

bracelets of gold and precious stones and many good coral beads are fitted to their arms. Thus the more part of this people is very wealthy.

3. Rich apparel in Vijayanagar, Cesare Federici[26]

The apparell that they use in Bezeneger is Velvet, Satten, Damask, Scarlet, or white Bumbast cloth, according to the estate of the person, with long Hats on their heads, called Colae, made of Velvet, Satten, Damask, or Scarlet, girding themselves in stead of girdles with some fine white Bumbast cloth: they have breeches after the order of the Turkes: they weare on their feet plaine high things called of them Aspergh, and at their eares they have hanging great plentie of gold.

4. Bindi and sindoor, Ralph Fitch[27]

Their women have their necks, armes and eares decked with rings of silver, copper, tinne, and with round hoopes made of ivorie, adorned with amber stones and with many agats, and they are marked with a great spot of red in their foreheads and a stroke of red up to the crowne, and so it runneth three maner of wayes.

5. Apparel of Baniyas at Goa, Jan Huygen van Linschoten[28]

Their Apparell is a thinne white Gowne vpon their naked bodies, from the head to the feet, and made fast on the side vnder their armes, their Shooes of red leather, sharpe at the toes, and turning vp like hookes, their Beards shauen like the *Turkes,* sauing onely their Moustachios, they weare on their Heads a white cloth three or foure times wrapped about like the *Bramenes,* and vnder their haire a Starre vpon their fore-heads, which they rub euery morning with a little white Sanders tempered with water, and three or foure graines of Rice among it, which the *Bramenes* also doe as superstitious Ceremonie of their Law. Their Bodies are commonly anoynted with Sanders and other sweet Woods, which they doe verie mach vse, as also all the *lndians.*

Their Women are apparelled like the *Bramenes* wiues; they eate like the *Mahometans,* and all other *Indian* vpon the ground. In their Houses or Assemblies they sit on the ground vpon Mats or Carpets, and always leaue their Shooes without the doore, so that they are alwayes bare-foot in their Houses: wherefore commonly the heeles of their shooes are neuer pulled vp, to saue labour of vntying or vndoing them, they haue a thousand other Heathenish superstitions which are not worth the rehearsall.

6. Dress in Bengal, Fray Sebastian Manrique[29]

The common people, both men and women, wear cotton cloth, unshaped and unsewn. The men dress in cloth of six to seven handbreadths, worn from the waist downwards; above they are naked, and they also wear no shoes. They wear on the head a turban of from twelve to fourteen spans long and two wide, costing in most places a quarter of a rupee. This is how the common people go about. Those who are better off and of higher station carry, thrown round the shoulders and upper part of the body, a piece of cloth of the same length as that mentioned above.

The women wear the same kind of cloth but in greater quantity, usually from eighteen to twenty spans, with which they completely cover the body. In some districts this ordinary cloth is so cheap that a woman can dress herself for four reals [one rupee]. The women usually have their arms covered with armlets and bracelets, which latter differ in size and pattern from the armlets. These rings are worn on the upper, central, and lower arm, so that the armlets may strike the eye better: they also wear large rings in the ears and other similar ornaments. In the walls of the nostrils, especially in the left wall, they carry a tiny ring of gold or silver; a few, who can afford it, adding one or two valuable pearls to it. They wear necklaces as well, which are usually made of bell-metal, a metallic substance superior to what we call Morisco latten.

7. White linen in common use, dress clean and easy, Pietro Della Valle[30]

…amongst the Indian Men, both Mahometans and Pagans, agreably to what *Strabo* testifies, they did of old wear onely white linnen, more or less fine according to the quality of the persons and the convenience they have of spending; which linnen is altogether of Bumbast [old word for cotton] or Cotton, (there being no Flax in *India)* and for the most part very fine in comparison of these of our Countries. The Garment which they wear next to the skin serves both for coat and shirt, from the girdle upwards being adorn'd upon the breast and hanging down in many folds to the middle of the Leg. Under this Cassack, from the girdle downwards, they wear a pair of long Drawers of the same Cloth, which cover not only their Thighs, but legs also to the Feet and 'tis a piece of gallantry to have it wrinkled in many folds upon the Legs. The naked Feet are no otherwise confin'd but to a slipper, and that easie to be pull'd off without the help of the Hand; this

mode being convenient, in regard of the heat of the Country and the frequent use of standing and walking upon Tapistry in their Chambers. Lastly, the Head with all the hair, which the Gentiles (as of old they did also, by the report of *Strabo)* keep long, contrary to the Mahometans who shave it, is bound up in a small and very neat Turbant, of almost a quadrangular form, a little long, and flat on the top. They who go most gallant, use to wear their Turbant only strip'd with silk of several colours upon the white, and sometimes with Gold; and like wise, their girdles wrought in Silk and Gold, instead of plain white. I was so taken with this Indian dress, in regard of its cleanliness and easiness, and for the goodly show me thought it had on horse-back, with the Scemiter girt on and the buckler hanging at a shoulder belt, besides a broad and short dagger of a very strange shape, ty'd with tassell'd strings to the girdle, that I caus'd one to be made for myself, complete in every point, and to carry with me to shew it in *Italy.*

8. Preference for white coloured clothes common also in Egypt, Pietro Della Valle[31]

…of white too they are so enamour'd that all Men are generally clothed with it; a custom per-adventure deriv'd to them from *Ægypt* where it was in use, as *Herodotus* writes, and whence perhaps *Pythagoras* himself learnt it, who went cloth'd in white, as we find noted by *Aelian* and others. And I observe that in many particulars the manners of the present *Indians* much resemble those of the ancient *Ægyptians;* but since the *Ægyptians,* who descended from *Cham* the son of *Noah,* were a very ancient people, I rather believe that the *Indians* learnt from the *Ægyptians* than the *Ægyptians* from the *Indians;* and 'tis known, that from *Ægypt* there was always Navigation and Commerce into *India* by the Southern Ocean.

9. Dress of Gentile women, red favourite colour, Pietro Della Valle[32]

…the Indian Gentile Women commonly use no other colour but red, or certain linnen stamp'd with works of sundry colours, (which they call Cit) but all upon red, or wherein red is more conspicuous then the rest, whence their attire seems onely red at a distance. And for the most part they use no garment, but wear onely a close Wastecoat, the sleeves of which reach not beyond the middle of the Arm, the rest whereof to the Hand is cover'd with bracelets of Gold or Silver or Ivory, or such other things according to the

ability of the persons. From the waste downwards they wear a long coat down to the Foot, as I have formerly writ that the Women do in the Province of *Moghostan* in *Persia,* near *Ormuz.* When they go abroad, they cover themselves with a cloak of the ordinary shape, like a sheet, which is also us'd by the Mahometans, and generally by all Women in the East; yet it is of a red colour, or else of *Cit* upon a red ground, that is of linnen stamp'd with small works of sundry colour upon red. Those that have them adorn themselves with many gold-works, and jewels, especially their ears with pendants sufficiently enormous, wearing a circle of Gold or Silver at their ears, the diametre whereof is oftentimes above half a span and 'tis made of a plate two fingers broad, and engraven with sundry works, which is a very disproportionate thing.

10. Red also colour of swamis, Pietro Della Valle[33]

The red colour amongst these *Indians* is, besides by the Women, worn also by the *Sami* [Swami], who are a kind of religious persons; with red the *Gioghi* [Jogis], who live like Hermits and go about begging, sometimes paint their bodies in many parts, and also with red blended with yellow, that is with some parcel of Sanders or Saffron, almost all the Indian Gentiles dye their fore-heads, and sometimes their garments; accordingly as *Strabo* reports, from the testimony of *Onesicritus* [who accompanied Alexander to India], they did likewise in the time of *Alexander* the Great. Lastly, they wear red Turbans upon their Heads, and their Girdles are oftner wrought with red then any other colour.

11. Dress in Calicut, hair worn long, Pietro Della Valle[34]

…as for clothing they need little, both Men and Women going quite naked, saving that they have a piece either of Cotton, or Silk, hanging down from the girdle to the knees and covering their shame; the better sort are either wont to wear it all blew, or white strip'd with Azure, or Azure and some other colour; a dark blew being most esteem'd amongst them. Moreover both Men and Women wear their hair long and ty'd about the head; the Women with a lock hanging on one side under the Ear becomingly enough as almost all Indian Women do; the dressing of whose heads is, in my opinion, the gallantest that I have seen in any other nation. The Men have a lock hanging down from the crown of the head, sometimes a little inclin'd on one side; some of them use a small colour'd head-band, but the Women use none at all. Both sexes have their Arms adorned with bracelets, their

ears with pendants, and their necks with Jewels; the Men commonly go with their naked Swords and Bucklers, or other Arms, in their hands, as I said of those of *Balagate* [Balaghat] .

12. Dress of Nair kings, Pietro Della Valle[35]

The King and all others, as I have said, commonly go naked; onely they have a cloth wherewith they are girded, reaching to the mid-leg. Yet, when upon any occasion the King is minded to appear much in Majesty, he puts on onely a white vestment of very fine cotton, never using either Cloth of Gold, or Silk. Others also when they please may wear the like garment, but not in the King's presence, in which 'tis not lawful for anyone to appear otherwise than naked, saving the cloth above-mentioned. The Arms which everyone wears must not be laid aside at any time, especially not before the King; and, as I have elsewhere noted, everyone keeps to one sort of Arms which he first takes to, without ever changing.

13. Dress of Hindu nobility, Niccolao Manucci[36]

With respect to their fashions of dress, I may say that the great nobles wear nothing more than the following: They bind their hair with a scarf of very fine gold stuff that they call *roma1s (rumali).* Then they tie round their waist a piece of white cloth (as is the usual practice in India); it is about four cubits in length and has a red border. It comes down to their knees. Above this they wear a white wrapper; but it is to be noted that the manner of putting this on varies in each caste. Some among them wear gold or silver rings on the toes. The children of these last carry from birth to seven years of age little bells on their legs, either of gold or silver, and a little chain of the same metal round the waist. As for the rest, they are no more covered than when they were brought into the world.

Some great lords wear a sort of turban on their heads, and put on a gown of white cloth that they call a *cabaye (qaba),* and underneath it very tight drawers; on their feet they have shoes of velvet or of red leather.

Remove shoes on entering house

These they remove when they enter a house or speak to a person of quality, for it is a great piece of bad manners in this country to speak to such a person with your shoes on and your head uncovered.

14. Dress of ordinary people, daytime garment serves as night time sheet, Niccolao Manucci[37]

The above is the apparel of the princes and the richest nobility. As for the soldiers, labourers, and other ordinary people, they have no more than a cloth bound round their head, and a little string round their middle, attached to which is a morsel of cloth, a span wide and a cubit in length, about the size of one of our ordinary napkins. With this cloth they cover the parts of the body that natural modesty requires to be concealed. Lastly, they have another cloth, somewhat of the same size, bound round the body, which serves in the day-time as a garment and at night as a bed, their mattress being identical with the damp earth. A stone or a piece of wood serves as bolster. Thus what would be looked on in Europe as a severe penance is in this country the ordinary habit. There are some so badly provided that they content themselves with the piece of cloth spoken of above as used to cover the private parts. In this equipment they hold themselves fully dressed and fit to talk to anyone, wherever it might be.

15. Ear piercing common, sari worn after girl turns ten, Niccolao Manucci[38]

From the age of twelve and upwards almost all of them [girls] allow their hair to grow long; up to that age they wear only a small tail of hair on the top of the head, like that of the little boys. They do not bind anything on, nor do they make the hair into tresses, but make it into a roll on one side of the head. All have their ears pierced, but not in the European way, for the holes are so large that the ears droop almost to the shoulders. In these holes they wear their ornaments, each according to her degree or her wealth. The custom of having the ears pierced is in this country common to men and women.

Women, when they are not widows, also wear ornaments on the neck, according to the diversity of their castes or of their wealth. Up to the age of nine or ten years they have no more clothing than, as I described above, is worn by boys up to the same age. After that time they wear a piece of white or red cotton cloth that they bind on like a petticoat. Sometimes the *pane (punjam),* – for so they call this cloth – is striped in two colours. One half of the said *pane (punjam)* is thrown over the shoulders or the head when speaking to a person of any position; but when they go to the well or a spring to fetch water, and when at work in their houses, they keep the whole

pane (punjum) bound round the waist, and thence upwards are naked. They wear nothing on the feet, not even princesses and queens; but the latter wear on their legs jewels of great value, and any other women who are able to afford it do the same.

16. Dress of royal ladies at Tanjore, Jon Olafsson[39]

They anoint themselves daily, and are adorned with the most costly finery: around their waists they have gold cloth sewn and adorned with precious stones, gold rings set with precious stones on their fingers and toes, also gold on their foreheads and in their ears and nostrils: bracelets about their wrists and ankles, and further, brocaded silk studded with precious stones round their heads; and on their breast a kerchief worth much money, adorned with pearls and gold jewels. All this finery they wear every day.

17. Wear hair long as did their ancestors, Jean de Thevenot[40]

The Indians wear their Hair for Ornament, contrary to the Mahometans who shave their Heads; and in that, as in many other things, the Indians imitate their Ancestours.

18. Difference between dress of Gentiles and Moors, J. Ovington[41]

For a distinction between the *Moors* and *Bannians,* the *Moors* tie their Caba's always on the Right side, and the *Bannians* on the left…

E. Cleanliness

1. Importance of bathing

(a) King of Cochin insists on daily bath even when ill, Cristovao da Costa[42]

In the year 1569 (when I was residing in Santa Cruz de Cochim, as the physician of the Royal Hospital) the King of Cochin (Brahmin and brother-in-arms of the Christian King of Portugal) fell ill with a serious disease of continuous fever which overtook him when he was weak and wasted of venereal use, and wishing to be treated by me alone, without the presence of his physicians. When I first called on him, he told me that he had to take bath daily even if it cost him his life.

(b) Emphasis on frequent washing, Jan Huygen van Linschoten[43]

They use to drinke out of a Copper kanne with a spout, whereby they let the water fall downe into their mouthes and neuer touch the Pot with their lippes. Their Houses are commonly strawed with Kow-dung, which they say killeth Fleas. They are verie cleane on their Bodies, for euerie day they wash themselves all their bodie ouer. They wash themselves with the left hand, because they eate with the right hand, and use no Spoones.

(c) Bathing no matter how cold, travel 5-600 kos for dip in Ganges, Francisco Pelsaert[44]

The Hindus are more punctilious and much stricter than the Moslems in their ceremonies. No one, man or woman, will omit to wash the body in the morning, however cold it may be. The common people go to a river or running water, while the rich bathe at home; and they will not touch food till they have washed. They sit down to eat, naked and with bare head, inside a well-marked enclosure, which no one enters while they are eating; if they are disturbed, they will give up that meal. They will not omit to go and bathe in the Ganges once a year; those who can manage it will travel 500 or 600 kos for the purpose. They bathe in October, and they are convinced that by doing so they are purified of all their sins. They bring back a little of the water of the Ganges and keep it in their house, which, so they think, will protect them from sorcery or witchcraft. The water certainly has one remarkable quality, in that it never stinks, and no worms appear in

it, even if it is kept for 100 years, and consequently they regard the river as sacred. The bathing-place lies about 40 kos from Agra.

2. Use of cow dung for purification, Pietro Della Valle[45]

[Cow dung]…besides cleanliness, is to them a Ceremonial Rite, which they think hath the virtue to purifie. But having observ'd it too in the houses of Christians, I find that indeed it cleanses exquisitely, and makes the floores and pavements of houses handsome, smooth and bright.

F. Food Habits

1. Baniyas of Gujarat eat no food of red colour, Jan Huygen van Linschoten[46]

They eate no Radishes, Onions, Garlick, nor any kind of Herbe that hath any colour of Red in it, nor Egges, for they thinke there is blood in them. They drinke not any Wine, nor vse any Vineger, but onely water.

2. Baniyas would starve to death than accept food from non-countrymen, Jan Huygen van Linschoten[47]

They are so dangerous of eating and drinking with other men which are not their Countrimen, that they would rather starue to death then once to do it. It happenneth oftentimes that they sayle in the *Portugals* ships from *Goa* to *Cochin,* to sell their Wares, and to traffique with the *Portugals,* and then they make their prouisions for so long time as they thinke to stay vpon the way, which they take aboord with them, and thereupon they feed. And if the time falleth out longer, then they made account of, their water and prouision being all spent, as it happened, when I sailed from Goa to *Cochin,* they had rather die for hunger and thirst then once to touch the *Christians* meat. They wash themselues before they eate, as the *Bramenes* doe.

3. Diet of Bengal, Fray Sebastian Manrique[48]

Their daily meal consists of rice with which, if they have nothing else to add, they take salt and are satisfied. They also use a kind of herb which is usually called Xaga [shaka, edible vegetables]; those better off use milk, *ghi*, and other lacteous preparations: fish is little eaten, especially by those who live inland.

4. Live on herbs, milk and butter, Edward Terry[49]

Some of which poore seduced infidels will eate of nothing that hath life; and these live upon herbs and milke and butter and cheese and sweet-meates, of which they make divers kindes, whereof the most wholsome is greene ginger, as well preserved there as in any part of the world. Others will eate fish, and no living thing else. The Rashbootes eate swines-flesh, most hatefull to the Mahometans. Some will eate of one kinde of flesh, some of another; but all the Gentiles abstaine from beefe, out of the excellent esteeme they have of kine; and therefore give of the King yeerly

(beside his other exactions) great summes of money as a ransome for those creatures; whence among other good provision we meete there but with little beefe.

5. Water preferred drink, Edward Terry[50]

This ancient drinke of the world (water) is the common drinke of India… Many of the people who are strict in their religion drinke no wine at all. They use a liquor more healthfull then pleasant, they call Cohha (coffee: Arabic *kahwa*): a blacke seed boyled in water, which doth little alter the taste of the water.

6. Drinking water without touching cup, Pietro Della Valle[51]

From this averseness to communicate one with another, particularly in the use of eating and drinking vessels, concerning which they are most strict, is sprung a strange Custom, which I was delighted not only to see, but also sometimes out of gallantry to imitate in conversation. It happens very often during hot weather, both in Travelling and in Towns, that people have need of refreshing themselves and drinking of a little water; but because every one hath not a drinking-vessel of his own ready, to avoid defiling or being defil'd by his companion's cup, there's a way found out whereby any person may drink in that, or any other whatever, without scruple or danger of any either active or passive contamination. This is done by drinking in such manner that the vessel touches not the lips or mouth of him who drinks; for it is held up on high with the hand over the mouth, and he that lifts it up highest, and holds it furthest from his mouth, shows himself most mannerly; and thus pouring the liquor out of the cup into the mouth, they drink round while there is any left, or so long as they please.

7. Fear of pollution, Pietro Della Valle[52]

And herein they are so scruplous that even amongst the Indians themselves one of more noble Race not only neither eats, nor makes use of the same Clothes or Vessels, nor communicates in anything with one less noble, but also endures not to be touch'd by him; which if it fall out by chance that he be, he must purifie himself from the defilement by washings and other arrogant Ceremonies. And hence 'tis a pretty sight to behold the great respect which upon this account the ignoble bear to the more noble then themselves, and how upon meeting in the street the ignoble not onely give place, but dance wildly up and down for fear of rushing against the noble,

and polluting them in any measure; which, if they should not do, the Noble, and especially the Souldiers, would make them do it to the Musick of blows.

8. Some in laborious professions eat meat, Brahmins rarely, Pietro Della Valle[53]

Wherein the *Ragiaputi* Souldiers, with the wonted military licentiousness, take most liberty without thinking themselves prejudic'd as to the degree of nobility. Next to them, the meanest and most laborious Professions are more licentious in eating then others, because they need more sustenance; some of which drink Wine too, from which the others more strict abstain to avoid ebriety and so from all other beverage that inebriates.

But those of other Races, whose employments admit more rest and a better life, are also more sparing and rigorous in the use of meats, especially the Brachmans, as I said, dedicated wholly to Learning and the Service of Temples, as the most noble of all. In testimony whereof they alone have the priviledge to wear a certain Ensign of Nobility in their Sect, whereby they are distinguisht from others; 'tis a fillet of three braids….

9. Cow's meat taboo, Niccolao Manucci[54]

Since neither Brahmans, ascetics, monks, nor the learned eat any meat or fish in this country (eggs, being here included under the head of meat, are also avoided), I think it as well here to state the food and manner of eating of the other castes. None of those I have hitherto spoken of ever eat cow's flesh. To do so is a very low thing, a defilement, and sinful beyond all imagination. But they eat all the other meats consumed in Europe, and, in addition thereto, rats and lizards. As for shell-fish, these also are classed among the most impure of thing, and are not used except by the pariahs. However, almost all the castes eat of the other kinds of meat, and judge it to be most delicious fare.

The food of these people is usually placed on a little cooked rice, and it consists generally of a portion of dry and salted fish. For goats, sheep, chicken, rats, and lizards, are only for the nobility, and if other men eat of these, it is solely at their festivals and at marriages. Their plate is a leaf, as described above, or a small plate of copper, out of which the whole family eats one after the other.

10. Mode of eating, Niccolao Manucci[55]

The ordinary dwelling of these Hindus being as poverty-stricken as I have described it, their mode of life is no better. For in this land there are no tables or chairs; everybody sits upon the ground. They do not use table-napkins, table-cloths, knives, spoons, or forks, salt-cellars, dishes, or plates; they eat no bread, they drink no wine, and all eat seated upon the ground.

Princes and kings

Princes and kings eat in the following manner: They are seated on the ground on a piece of fine cloth. Then the house or the room in which they are to eat is rubbed over with a solution of cowdung. As the palaces of kings have floors made of a cement which looks like fine marble, there they do nothing more than throw down some cowdung mixed in water, and then wipe the floor with a piece of cloth. The floor then looks like a looking-glass. Without all this ceremonial of cleansing with the dung of this animal, as above described, no person of quality sits down to eat. These preparations finished, they bring a great platter of enamelled gold, which is placed on the ground in front of the diners, but without allowing it to touch the cloth on which they are seated. After this some small gold dishes are placed around, and the food is brought from the kitchen in bowls or vessels of silver, fashioned in the shape of cooking-pots. First of all, from these bowls they place rice cooked without salt or other condiment in the large dish, and on this they put some stew. If the whole cannot be contained in the large dish, they put the remainder in the small dishes round about it.

Then the rajah takes whatever pleases him, throwing it with his hand into a plate of rice, where he mixes it and rolls it into balls, which he throws into his mouth with the right hand. The left hand is not allowed to touch any food. All is swallowed without mastication. This fashion they consider very cleanly, and that there is no better way of satisfying oneself; and they say that Europeans eat rice like pigs.

Then, before finishing the meal, they send as much as they think sufficient to their wives. For in this country these never eat with their husbands, even though those waiting on the king be eunuchs, children, or women.

Eating habits of ascetics and Brahmins

The way of eating among the other castes who are not kings is as follows: Monks, ascetics, Brahmans, and the learned before eating wash their hands and bodies. Then they put upon their foreheads, stomach, shoulders, knees

and sides a little ashes mixed in water. This ash is either of a white earth they call *naman (namam)*, or of sandal, according to their caste or the faith they follow. Next they enter the house, finding its floors all rubbed over with cowdung, in the way I have spoken of. They bind round their body a piece of cloth, and sit down with their legs crossed, or upon a small mat of about one cubit in length. Before them is placed the large leaf of certain trees, or smaller leaves of other trees stitched together, not with needle and thread, but with rushes. Upon this leaf is put first of all a pinch of salt and two drops of butter, with which they anoint or rub the leaf. This ceremony completed, they deposit on this platter some rice cooked in water without salt, followed by a little vegetables and some green stuff. When this is eaten, they throw upon the rice left on the said leaf a little sour curds or some whey. When all this food has been swallowed, they rise from the place and move to a courtyard or garden, if there is one in the house where they live. If there is not, they go into the street, and there bathe their hands, mouth, and feet. They do not return to their dwellings till the leaves they have eaten from have been removed, and the ground has been rubbed over afresh in the way already mentioned. For they say that if they did so their bodies would be as polluted as the house.

11. Fast frequently, Jean de Thevenot[56]

The Gentiles generally are great Fasters, and none of them let a fortnight pass over without mortifying themselves by Abstinence, and then they fast four and twenty hours; but that is but the ordinary Fast, for there are a great many Gentiles (and especially Women) who will fast six or seven days; and they say, there are some that will Fast a whole month, without eating any more than a handful of Rice a day, and others that will eat nothing at all, only drink Water, in which they boyl a Root, called *Criata*, which grows towards *Cambaye*, and is good against many distempers; it makes the Water bitter, and strengthens the Stomach.

12. The way Baniyas prepare their food, Jean de Thevenot[57]

Most part of the Gentiles, Heads of Families in *Viziapour,* dress their own Victuals themselves; he that do’s it having swept the place where he is to dress any thing, draws a Circle, and confines himself within it, with all that he is to make use of; if he stand in need of any thing else, it is given him at a distance, because no body is to enter within that Circle, and if any chanced to enter it, all would be prophaned, and the Cook would throw

away what he had dressed, and be obliged to begin again. When the Victuals are ready, they are divided into three parts, The first part is for the Poor, the second for the Cow of the House, and the third portion for the Familie, and of this third they make as many Commons [shares] as there are Persons; and seeing they think it not civil to give their leavings to the poor, they give them likewise to the Cow.

13. Gentiles will not eat with others, Giovanni Careri[58]

All the Sects of *Gentils* on this side *Ganges,* are very scrupulous as to Eating with Christians, and *Mahometans,* or making use of the same Utensils. But those beyond *Malaca* make no Difficulty of it.

14. Tea drinking common

(a) Cleanses system, John Albert de Mandelslo[59]

At our ordinary meetings every day we took only *The*, which is commonly used all over India, not only among those of the Country, but also among the Dutch and English, who take it as a Drug that cleanses the Stomach, and digest the superfluous humours, by a temperate heat particular thereto.

(b) Baniyas also tea drinkers, J. Ovington[60]

The *Bannians* are not restain'd from the liberal Draughts of Tea and Coffee, to revive their wasted Spirits any part of the Day…

15. Curd, J. Ovington[61]

Dye [dahi] is a particular innocent kind of Diet, fed upon by the *Indians* for the most part about Noon. It is sweet Milk turn'd thick, mix'd with boil'd Rice and Sugar, and is very effectual against the Rage of Fevers and of Fluxes, the prevailing Distempers of India.

G. Betel Eating

1. Beneficent qualities, Sir Thomas Roe[62]

…it bytts in the mouth, avoydes rume, cooles the head, strengthens the teeth, and is all their phisicke…

2. For health's sake and delight, Pietro Della Valle[63]

These leaves [*Pan*] the Indians use to champ or chaw all day long, either for health's sake or for entertainment and delight (as some other Nations for the same reasons, or rather through evil custome, continually take Tobacco). And therewith they mix a little ashes of sea-shels and some small pieces of an Indian nut sufficiently common, which here they call *Foufel*, and in other places *Areca;* a very dry fruit, seeming within like perfect wood; and being of an astringent nature they hold it good to strengthen the Teeth. Which mixture, besides its comforting the stomack, hath also a certain biting taste, wherewith they are delighted; and as they chaw it, it strangely dyes their lips and mouths red, which also they account gallant; but I do not, because it appears not to be natural.

3. Betel offered by way of politeness, Niccolao Manucci[64]

Betel, or *pan,* is a leaf similar to the ivy-leaf, but the betel leaf is longer; it is very medicinal, and eaten by everybody in India. They chew it along with 'arrecas' *(areca),* which physicians call *Avelans lndicas* (Indian filberts), and a little *catto (kath* or *katha),* which is the dried juice of a certain plant that grows in India. Smearing the *betel* leaf with a little of the *kath,* they chew them together, which makes the lips scarlet and gives a pleasant scent. It happens with the eaters of *betel,* as to those accustomed to take tobacco, that they are unable to refrain from taking it many times a day. Thus the women of India, whose principal business it is to tell stories and eat *betel,* are unable to remain many minutes without having it in their mouths.

It is an exceedingly common practice in India to offer betel leaf by way of politeness, chiefly among the great men, who, when anyone pays them a visit, offer *betel* at the time of leaving as a mark of goodwill, and of the estimation in which they hold the person who is visiting them. It would be a great piece of rudeness to refuse it.

H. Economic disparities

1. High level of endurance of common people, Francisco Pelsaert[65]

…the utter subjection and poverty of the common people – poverty so great and miserable that the life of the people can be depicted or accurately described only as the home of stark want and the dwelling-place of bitter woe. Nevertheless, the people endure patiently, professing that they do not deserve anything better; and scarcely anyone will make an effort, for a ladder by which to climb higher is hard to find, because a workman's children can follow no occupation other than that of their father, nor can they intermarry with any other caste.

Condition of artisans, servants and shopkeepers

There are three classes of the people who are indeed nominally free, but whose status differs very little from voluntary slavery – workmen, peons or servants, and shopkeepers.

Workmen – low wages, oppression by the powerful

For the workman there are two scourges, the first of which is low wages. Goldsmiths, painters [those who made 'painted' cloth, or chintz], embroiderers, carpet-makers, cotton or silk-weavers, blacksmiths, coppersmiths, tailors, masons, builders, stone-cutters, a hundred crafts in all, for a job which one man would do in Holland here passes through four men's hands before it is finished, – any of these by working from morning to night can earn only 5 or 6 *tackas* [tankas], that is, 4 or 5 stivers in wages. The second [scourge] is [the oppression of] the Governor, the nobles, the Diwan, the Kotwal, the Bakhshi, and other royal officers. If any of these wants a workman, the man is not asked if he is willing to come, but is seized in the house or in the street, well beaten if he should dare to raise any objection, and in the evening paid half his wages, or nothing at all.

Khichri normal diet

From these facts the nature of their food can be easily inferred. They know little of the taste of meat. For their monotonous daily food they have nothing but a little *khichri,* made of green pulse mixed with rice, which is cooked with water over a little fire until the moisture has evaporated, and

eaten hot with butter in the evening; in the day time they munch a little parched pulse or other grain, which they say suffices for their lean stomachs…

Profusion of servants in houses of lords, paid a pittance

Peons or servants are exceedingly numerous in this country, for everyone – be he mounted soldier, merchant, or king's official – keeps as many as his position and circumstances permit. Outside the house, they serve for display, running continually before their master's horse; inside, they do the work of the house, each knowing his own duties. The *tziurewardar*[?] attends only to his horse, the *bailwan,* or carter, to his cart and oxen; the *farrash,* or tent-pitcher, attends to his tent on the way, spreads carpets, both on the march and in the house, and looks after the *diwan-khana* or sitting room; the *masalchi,* or torch-bearer, looks to his torch, and lights lamps and candles in the evening; the *sarwan,* or camel-driver, looks to his camel; and there are two or three *mahawats* or attendants to each elephant according to its size. The *tsantel,* or messenger, a plume on his head and two bells at his belt, runs at a steady pace, ringing the bells; they carry their master's letters a long distance in a short time, covering 25 to 30 kos in a day; but they eat much *postibangh* or opium regularly, so that they do not feel the continuous work or fatigue. They run on with dizzy head; they will not as a rule answer anyone who asks where they come from or where they are going, but hurry straight on. These messengers may bring their masters, who hold official positions as governors, into great credit, or disgrace, with the King, because letters on important official business are sometimes delayed, and if the news they contain should reach the King first from some other place, whether nearer or more distant, the officer will be blamed for negligence, and dismissed from his post. There are many more servants in the crowd, whom it would take too long to enumerate; in the houses of the great lords each servant confines himself strictly to his own duties, and it is like life on the Portuguese ships, where the chief boatswain, if he saw the foremast fall overboard, would not disgrace himself by going forward or on to the forecastle, though he could save the mast by doing so.

For this slack and lazy service the wages are paid by the Moguls only after large deductions, for most of the great lords reckon 40 days to the month, and pay from 3 to 4 rupees for that period; while wages are often left several months in arrears, and then paid in worn-out clothes or other things.

If, however, the master holds office or power, the servants are arrogant, oppressing the innocent, and sinning on the strength of their master's greatness…

Shopkeepers forced to sell below cost

Whatever he may deal in – spices, drugs, fruit, cotton goods, cloth, or anything else – the shopkeeper is held in greater respect than the workman, and some of them are even well-to-do; but they must not let the fact be seen, or they will be the victims of a trumped-up charge, and whatever they have will be confiscated in legal form, because informers swarm like flies round the governors, and make no difference between friends and enemies, perjuring themselves when necessary in order to remain in favour. Further, they are subject to a rule that if the King's nobles, or governors, should require any of their goods, they must sell for very little – less than half price; for to begin with, they must give great weight for small coins, the difference being 20 per cent; then 9 per cent is deducted for *dasturi* [commission]; then clerks, overseers, cashiers, and others all know very well how to get their share; so that in such circumstances the unfortunate shopkeeper may be robbed in a single hour of the profits of a whole month, although they bear the general cost.

This is a short sketch of the life of these poor wretches, who, in their submissive bondage, may be compared to poor, contemptible earthworms, or to little fishes, which, however closely they may conceal themselves, are swallowed up by the great monsters of a wild sea.

Rich live off the sweat of poor

…the pen which has described bitter poverty, clothed with the woeful garment of sighs, the foe of love, friendship and happiness, but the friend of loneliness wet with the daily dew of tears, – that pen must entirely change its style, and tell that in the palaces of these lords dwells all the wealth there is, wealth which glitters indeed, but is borrowed, wrung from the sweat of the poor. Consequently their position is as unstable as the wind, resting on no firm foundation, but rather on pillars of glass, resplendent in the eyes of the world, but collapsing under the stress of even a slight storm.

2. Oppression of the peasantry

(a) Father Jerome Xavier on conditions in Kashmir in 1597[66]

…it is very much uncultivated and even depopulated from the time this King [Akbar] took it and governs it through his captains, who tyrannise over it…and bleed the people by their extortions…And they say that before this King they were sufficiently provided with food…Now everything is wanting for there are no cultivators on account of the violence done them.

(b) Father Jerome Xavier's letter from Agra in 1609[67]

…the poor labourers desert them [the lands] and run away which is the reason why they are poorly peopled.

(c) Father Jerome Xavier on Gujarat in 1615[68]

The lands are much spoiled which at an earlier period were taken by the Mongores: for they destroy everything with their oppressions.

(d) Wives and children of defaulting cultivators sold, Francisco Pelsaert[69]

The land would give a plentiful or even an extraordinary yield, if the peasants were not so cruelly and pitilessly oppressed; for villages which, owing to some small shortage of produce, are unable to pay the full amount of the revenue-farm, are made prize, so to speak, by their masters or governors, and wives and children sold, on the pretext of a charge of rebellion. Some peasants abscond to escape their tyranny, and take refuge with rajas who are in rebellion, and consequently the fields lie empty and unsown, and grow into wilderness. Such oppression is exceedingly prevalent in this country.

(e) Dutch factor, Wollebrand de Jongh Geleynssen on Gujarat in 1629[70]

…the peasants are more oppressed than formerly [and] frequently abscond.

3. Inability of peasants to pay high revenue demand, Fray Sebastian Manrique[71]

[The peasants have] no possessions or assets from which to pay…[and are] beaten unmercifully and maltreated…They are carried off, attached to heavy iron chains, to various markets and fairs[to be sold], with their poor, unhappy wives behind them carrying their small children in their arms, all crying and lamenting their evil plight.

4. Armed resistance by peasants

(a) In present-day Kanpur district in 1632, Peter Mundy[72]

…labourers with their guns, swords, and bucklers lyeing by them whilest they ploughed the ground, being att varience with towne ½ a mile out of the way…

(b) In the Mathura region, Niccolao Manucci[73]

The women stood behind their husbands with spears and arrows. When the husband had shot off his matchlock, his wife handed him the lance, while she reloaded the matchlock.

5. Bijapur, state of coolies, Abbe Carre[74]

I had been astonished, since I left Bicholim [eight miles north of Goa], to find the roads crowded with troops of people, carrying such heavy burdens on their heads that I could not look on them without deep compassion. I asked my servants why these poor folk carried such heavy weights over the difficult mountain roads, which we, even without loads, could scarcely surmount. I was told that these people were of the same cooly caste as the carriers of my palanquin and my baggage; that they had no other occupation but that of carrying heavy burdens; and that they dwelt on the coast near Goa, and gained their living by taking dried fish, coconuts, arrack, and other comestibles, to sell in Bijapur. They were paid 2½ ecus a load, however great the weight. I marvelled how these poor creatures could earn enough to live on, and stand such heavy fatigue for the twenty-five to thirty days that each trip lasted. I might certainly have been told that it was scarcely enough for their food and upkeep in so long a journey and might well have believed it, had not my daily experience led me to know otherwise. These people did not spend their small wages, but kept them for their families on their return. I had eight of these coolies, six for my palanquin and two for my luggage. I gave each three rupees, which is 1½ ecus, to take me to Bijapur, without being obliged to give them any food. I found that they provided themselves, before starting, with a little rice and dried fish, which cost them hardly anything in their own country. This lasted all the journey, with what they find in the villages, where they are given fruit and milk, and some millet, from which they make flour. This is soaked in cold water and made into flat cakes, which are baked over a fire on iron plates supported by three stones. In certain places they find caste-fellows, who kindly cook them some herbs in oil or butter, which they eat with these pancakes. Their greatest support, however, is tobacco, which they are always smoking, so that they devoured more smoke than anything

else. Besides water, they drink toddy, conjee [kanji], and arrack. Toddy is a kind of wine, which they extract from palm-trees. It is the colour of milk, has a pleasant taste, rather like white wine, and is very refreshing. Conjee is only boiled water with a little rice in it, which is given them on arrival in any village. There is always a house which keeps this drink ready on the fire for passers-by who, in the heat and sweat they are in, would probably die if they drank cold water. Arrack is a spirit made out of toddy, which they distil, as we do brandy. They mix with it a red root called canja [ganja, the hemp plant]; the infusion intoxicates them so much that they become like lunatics and out of their senses, when they drink it to excess, though it gives them strength and vigour, if taken in moderation and only as a refreshment.

6. Peasants flee land on account of oppression in Mughal India, Jean-Baptiste Tavernier[75]

I should say en passant that the peasants have for their sole garment a scrap of cloth to cover those parts which natural modesty requires should be concealed; and that they are reduced to great poverty, because if the Governors become aware that they possess any property they seize it straightway by right or by force. You may see in India whole provinces like deserts from whence the peasants have fled on account of the oppression of the Governors. Under cover of the fact that they are themselves Musalmans, they persecute these poor idolaters to the utmost…

I. Funeral Rites

1. Brahmins attend to dying, Fernao Nuniz[76]

When a Brahman is sick, before he dies, they send to call the learned Brahmans who are his priests, so that they should come to pray, and console the sick man; and they talk to him of the affairs of his soul, and what he must do to save it, bidding him spend money in alms. After this ceremony is over they make the Brahman priests shave the sick man's head, and after the shaving they bid them wash it, and after the washing it is their custom to bring into their houses a cow with a calf – there are very few Brahmans, however poor they be, who do not have one to live in their house, – which cow, when they have finished washing the man's head, they take a turban and tie it to its neck and put the end of the turban into the hand of the sick man, and he gives it and the calf in alms for his soul to those priests who perform these ceremonies. On that day he gives alms according to his position, and gives to eat to some Brahmans who are invited and who come there for the purpose. They believe that when these ceremonies are made for the sick man, if he is to live he is soon cured of his infirmity, and if not that he soon dies.

Body prepared for cremation

After the death of the sick man they have the ground washed upon which he lay, and after the washing they take cow-dung and spread it over the ground, and place the body on the top of this dung. They hold that a sick man who dies on a cot, or on anything soever except only on the ground, commits a mortal sin. As soon as the body is laid on the ground they make for it a bier covered with boughs of the fig tree, and before they place the body on the bier they wash it well with pure water, and anoint it with sandal-wood [paste or oil]; and they place by the body branches of sweet basil and cover it with a new cloth, and so place it in the bier.

Bier lifted by four people

Then one of his relatives takes the bier on one side, and they call three other Brahmans whosoever they may be to aid them to lift it; and so they carry it to the place where they are to burn it, accompanied by many Brahmans who go singing in front of the corpse. In front of all goes his son, if he had one, or next younger brother or nearest relative, with fire in the hand for the

burning. As soon as they arrive at the place where they have to burn the body, they scatter money according to their ability, and then put the fire to it; and they wait there till the whole body is consumed, and then all go and wash their bodies in a tank and afterwards return each one to his house.

Relation who lights the pyre sleeps nine nights on the ground where man died

The son or brother or relation who put the fire is obliged to sleep on the ground where the man died for nine nights, and after the lapse of nine days from the death come the priests and learned men and they command to shave the head of this man. During these nine days, they feed the poor and they give them the dead man's clothes, and they give the cot with its bed in alm to the priests, with some money in addition; if he is a rich man they give gardens and other things in alms to many Brahmans.

Tenth day ceremonies

When ten days are finished, and the son has been shaved, he goes to the place where they burned his father or his brother, and they perform many ceremonies over the ashes and bones that remain unburned; then they put them in a small vessel and make a pit in the ground and bury them in it, and keep them thus guarded and buried in order (afterwards) to send the bones to be thrown into a sacred river, which is distant from Goa over one thousand leagues [Ganga in Banaras]. There is a very large temple there, the object of many pilgrimages, and they hold that every pilgrim who dies there is saved, and goes to Paradise, and also every dead man whose bones are thrown into that river. In spite of this they in reality take very few people there.

Brahmins fed

The heir or the father or son of the dead man is obliged, from the day of the date, for eleven days to give food to twenty-seven Brahmans, and until twenty-one days to three others; until twelve days again he feeds seven Brahmans, and until twenty-seven days give to eat to the three; on the last day of the month he gives food to three others, and thenceforward, until one year is finished, he gives meals once a month to three Brahmans. They do this in honour of the Trinity for the soul of the deceased. When this year is over he gives no more alms, except that each year, on the day on which the death happened [shraddha ceremony], he feeds six Brahmans – namely,

three in honour of the Trinity and three for the persons of his father, grandfather, and great-grandfather; who thus seemingly eat together. Thus he obtains favour with God, and for these expenses they beg alms of the Brahmans if they are poor. These give him all help for it. Before they dine they wash the feet of all six, and during the meal some ceremonies are performed by Brahman priests who come there for that purpose.

2. Funeral ceremonies common among all Hindus, Niccolao Manucci[77]

Now I come to funeral ceremonies for the dead; and as all have the same practice – namely, that the wife removes her *tali* on the death of her husband – I shall say little, and that only briefly, about the ceremonies with which they cremate a dead body and carry out the details connected therewith. It is after these are completed that the woman must cut off her *tali,* and therein consists her act of widowhood; and it is for this reason that in their language the name given to a widow means "the woman who has cut off the *tali'*.

All Hindus burn their dead, except the infamous sect of the Lingam. These bury the bodies, not in their temples – for that, in this country, would be the most abominable sacrilege that could be committed – but in a field distant from their dwellings. As to all other castes, they also burn them in a field distant from the town or village, which each locality has set apart expressly for this purpose.

The mode of burning the body is as follows: First of all, no Brahman, however rich he may be, is allowed to die within his house, for in their belief all within it would be thereby defiled. This is the reason that before he expires they carry him into a courtyard, and there place him under a sort of gallery, which every house has for the purpose. Should it happen that the Brahman dies a sudden death within the house, they carry the body at once, with all imaginable haste, and place it under the gallery alluded to. Then, breaking all the earthen vessels in the house, all the inmates quit it, and do not reenter it until it has been well rubbed over with cowdung, and until, as one may say, the interdict has been removed by a number of ceremonies used by them for this purpose.

When a Brahman dies, all his female relations and female friends stand in a circle, and with their stomachs bared beat themselves severely with their

two hands, weeping for the dead; and, moving round, they sing a song learnt for the purpose. It is extremely well suited to the conditions of the time and place in which they find themselves. After they have been round three times in this fashion, they bathe the body, dress it in new clothes, put some ground sandal-wood on the forehead, and then deposit it in a sort of coffin which is quite open. It may be interjected here that this coffin is made just as our hand-barrows for manure, constructed like them from pieces of wood tied together with straw. Then four Brahmans carry the body to the burning-ground. They are preceded by a sort of shrine, highly ornamented and covered with flowers. Having arrived at the cemetery, they perform for him all the usual ceremonial, and burn him with all the solemnities that I have remarked upon in regard to their marriages.

After the body has been burnt, the Brahmans bathe their bodies, and wash the pieces of cloth which they used for clothing themselves. All dripping as they are, they put these on again and return home. Thence they proceed to the house of the deceased, where a feast is given. On that day it is served under some palm-trees, which they say represent the deceased. There for the space of ten days all the friends and relations weep for the deceased; each of the nearest relations gives a sort of petticoat they call a *panes (punjam)* to the deceased's widow, and his brothers subscribe and give her a half-moon of silver.

On the tenth day, after loud lamentation, the deceased's widow flings her arms round the neck of another widow, weeping and displaying all imaginable signs of grief. Meanwhile, all the other widows present cut off the piece of gold attached to her neck, which they call a *tali.* It should be noted that no married women may take part in this act, which constitutes the woman a widow.

Every year upon the anniversary of her husband's death, a young widow performs a holocaust, feeds four or five Brahmans, and if she is rich she also gives them clothes. She does the same every month at the new moon, but with less expense and formality. Whatever is essential in funerals of the Brahman caste is also common to the other castes. This is the reason that I shall not say anything special about them…

□

Chapter 3
Festivals and Fairs

A. Festivals

B. Fairs

C. Games

A. Festivals

1. Dussehra at Vijayanagar, Domingo Paes[1]

You should know that among these heathen there are days when they celebrate their feasts as with us; and they have their days of fasting, when all day they eat nothing, and eat only at midnight. When the time of the principal festival arrives the king comes from the new city to this city of Bisnaga, since it is the capital of the kingdom, and it is the custom there to make their feasts and to assemble. For these feasts are summoned all the dancing-women of the kingdom, in order that they should be present; and also the captains and kings and great lords with all their retinues – except only those whom the king may have sent to make war, or those who are in other parts, or at the far end of the kingdom on the side where (an attack) is feared…These feasts begin on the 12th of September and they last nine days, and take place at the king's palace.

The palace is on this fashion: it has a gate opening on to the open space of which I have spoken, and over this gate is a tower of some height, made like the others with its verandahs; outside these gates begins the wall which I said encircled the palace. At the gate are many doorkeepers with leather scourges [whips] in their hands, and sticks, and they let no one enter but the captains and chief people, and those about whom they receive orders from the Chief of the Guard. Passing this gate you have an [vast] open space, and then you have another gate like the first, also with its doorkeepers and guards; and as soon as you enter inside this you have a large open space, and on one side and the other are low verandahs where are seated the captains and chief people in order to witness the feasts and on the left side of the north of this open space is a great one storeyed building (*terrea*); all the rest are like it. This building stands on pillars shaped like elephants and with other figures, and all open in front, and they go up to it by staircases of stone; around it, underneath, is a terrace (*corredor*) paved with very good flagstones, where stand some of the people looking at the feast. This house is called the House of Victory, as it was made when the king came back from the war against Orya [Orissa] ... On the right side of the open space were some narrow scaffoldings, made of wood and so lofty that they could be seen over the top of the wall; they were covered at the top with crimson and green velvet and other handsome cloths, and adorned from top to

bottom. Let no one fancy that these cloths were of wool, because there are none such in the country, but they are of very fine cotton. These scaffoldings are not always kept at the place, but they are specially made for these feasts; there are eleven of them. Against the gates there were two circles in which were the dancing-women richly arrayed with many jewels of gold and diamonds and many pearls. Opposite the gate which is on the east side of the front of the open space, and in the middle of it, there are two buildings of the same sort as the House of Victory of which I have spoken; these buildings are served by a kind of staircase of stone beautifully wrought – one is in the middle and the other at the end. This building was all hung which rich cloths, both the walls and the ceiling, as well as the supports, and the cloths of the walls were adorned with figures in the manner of embroidery; these buildings have two platforms one above the other, beautifully sculptured, with their sides well made and worked, to which platforms the sons of the king's favourites come for the feasts, and sometimes his eunuchs. On the upper platform, close to the king, was Christovao de Figueiredo, with all of us who came with him, for the king commanded that he should be put in such a place as best to see the feasts and magnificence. That I may not forget to tell of the streets that are in the palace I here mention them. You must know that inside the palace that I have spoken of is the dwelling of the king and of his wives and of the other women who serve them, as I have already said, who are twelve thousand in number; and they have an entrance to these rows of houses so that they can go inside. Between this palace and the House of Victory is a gate which serves as passage to it. Inside there are thirty-four streets.

Returning to the feasts, you must know that in this House of Victory the king has a room (casa) made of cloth, with its door closed, where the idol has a shrine: and in the other in the middle (of the building), is placed a dais opposite the stair-case in the middle; on which dais stands a throne of state made thus – it is four-sided, and flat, with a round top, and a hollow in the middle for the seat. As regards the woodwork of it, you must know that it is all covered with silk cloths (*? soajes*) [probably silk cushions], and has lions all of gold, and in the spaces between the cloths *(soajes)* with many rubies and seed-pearls, and pearls underneath; and round the sides it is all full of golden images of personages, and upon these is much work in gold, with many precious stones. In this chair is placed an idol, also of gold, embowered in roses and flowers. On one side of this chair, on the dais

below, stands a head-dress; this also is made in the same manner; it is upright and as high as a span, the top is rounded, it is all full of pearls and rubies and all other precious stones, and on the top of it is a pearl as large as a nut, which is not quite round. On the other side is an anklet [virakadaga or virapende; an anklet as a sign of heroism worn by the kings and warriors] for the foot made in the same fashion; it is another state jewel, and is full of large pearls and of many rubies, emeralds, and diamonds, and other stones of value; it will be of the thickness of a man's arm. In front of all this, at the edge of the dais resting on a support were some cushions where the king was seated during all these feasts. The feasts commence thus:

You must know that when it is morning the king comes to this House of Victory, and betakes himself to that room where the idol is with its Brahmans, and he performs his prayers and ceremonies. Outside the house are some of his favourites, and on the square are many dancing-girls dancing. In their verandahs round the square are many captains and chief people who come there in order to see; and on the ground, near the platform of the house, are eleven horses with handsome and well-arranged trappings, and behind them are four beautiful elephants with many adornments. After the king has entered inside he comes out, and with him a Brahman who takes in his hand a basket full of white roses and approaches the king on the platform and the king taking three handfuls of these roses, throws them to the horses and after he has thrown them he takes a basket of perfumes and acts towards them as though he would cense [smell them, this gesture is a part of the ritual in South India] them; and when he has finished doing this he reaches towards the elephants and does the same to them. And when the king has finished this, the Brahman takes the basket and descends to the platform, and from thence puts those roses and other flowers on the heads of all the horses, and this done, returns to the king. Then the king goes again to where the idol is, and as soon as he is inside they lift the curtains of the room, which are made like the purdahs of a tent, *(Paredes, probably 'purdahs' curtains or screens.)* and the king seats himself there where these are, and they lift them all. Thence he witnesses the slaughter of twenty-four buffaloes and a hundred and fifty sheep, with which a sacrifice is made to that idol; you must know that they cut off the heads of these buffaloes and sheep at one blow with certain large sickles which are wielded by a man who has charge of this slaughter; they are so sure of hand that no blow misses. When they have finished the slaughter of these cattle the king goes

out and goes to the other large buildings, on the platforms of which is a crowd of Brahmans, and as soon as the king ascends to where they stand they throw to the king ten or twelve roses – those (that is) who are nearest to him. Then he passes all along the top of the buildings and as soon as he is at the end he takes the cap from his head, and after placing it on the ground turns back (to the place) where the idol is; here he lies extended on the ground [the Sirasastanganamaskara, prostrating with eight limbs of the body to God]. When he has arisen he betakes himself to the interior of the building and enters a garden (*or walled enclosure-quyntal*) here they say that a little fire has been made, and he throws into the fire a powder made up of many things, namely rubies and pearls and all other kinds of precious stones and aloes and other sweet-scented things. This done, he returns to the pagoda and goes inside and stays a little, at which time enter by the other door some of his favourites who are in the building, and they make their salaam. Then he goes back to the place whence he threw the flowers to the horses, and as soon as he is here all the captains and chief people come and make their salaam to him, and some, if they so desire, present some gifts to him; then as they came so they retire, and each one betakes himself to his own dwelling. And the king withdraws to the interior of his palace by that gate which I have already mentioned – that which stands between the two buildings that are in the area (*terreyro*) the courtesans [unmarried girls] and bayaderes [courtesans in the service of the king] remain dancing in front of the temple and idol for a long time. This is what is done during the morning of each day of these nine days, with the ceremonies I have mentioned, and each day more splendid (than the last).

Wrestling, dancing,

Now, returning to the feasts. At three O'clock in the afternoon every one comes to the palace. They do not admit every one at once (they allowed us to go into the open part that is between the gates), but there go inside only the wrestlers and dancing women, and the elephants, which go with their trappings and decorations, those that sit on them being armed with shields and javelins, and wearing quilted tunics. As soon as these are inside they range themselves round the arena, each one in his place, and the wrestlers go close to the staircase which is in the middle of that building, where has been prepared a large space of ground for the dancing-women to wrestle. Many other people are then at the entrance-gate opposite to the building,

namely Brahmans, and the sons of the king's favourites, and their relations; all these are noble youths who serve before the king. The officers of the household go about keeping order amongst all the people, and keep each one in his own place. The different pavilions are separated by doors, so that no one may enter unless he is invited.

Salvatinica (*Saluva Timma, the minister*) who is the principal person that enters the building, supervises the whole, for he brought up the king and made him king, and so the king looks on him like a father [and addresses him 'Appaji']. Whenever the king calls to him he addresses him as 'Lord *(senhor)* Salvatinica,' and all the captains and nobles of the realm make salaam to him. This Salvatinica stands inside the arena where the festivals go on, near one of the doors, and from there gives the word for the admission of all the things necessary for the festival.

After all this is done and arranged, the king goes forth and seats himself on the dais I have mentioned, where is the throne and the other things, and all those that are inside make their salaam to him. As soon as they have done this the wrestlers seat themselves on the ground, for these are allowed to remain seated, but no other, howsoever great a lord he be, except the king so commands, and these also eat betel though none else may eat it in his presence except the dancing-women, who may always eat it before him. As soon as the king is seated in his place he bids to sit with him three or four men who belong to his race, and who are themselves kings and the fathers of his wives; the principal of these is the king of Syrimgapatao [Srirangapattana] and of all the territory bordering on Malabar, and this king is called Cumarvirya (*Kumara Virayya),* and he seats himself as far in front as the king on the other side of the dais, the rest are behind.

There the king sits, dressed in white clothes all covered with embroidery [probably, a kind of 'Kamataki Kasuti or Kasida' work] of golden roses and wearing his jewels – he wears a quantity of these white garments, and I always saw him so dressed – and around him stand his pages with his betel, and his sword, and the other things which are his insignia of state. Many Brahmans stand round the throne on which rests the idol, fanning it with horsetail plumes ['cowri' or fly-whisk specially made of the yaktail], coloured the handles of which are all overlaid with gold; these plumes are tokens of the highest dignity; they also fan the king with them.

But returning to the feasts, as soon as the king is seated, the captains who waited without make their entrance, each one by himself, attended by his chief people, and so on, all in order; they approach and make their salaams to the king, and then take their places in the pavilions *(veramdas)* which I have previously described. As soon as these nobles have finished entering, the captains of the troops approach with shields and spears, and afterwards the captains of the archers; these officers are all stationed on the ground around the arena in front of the elephants, and they constitute the king's guard, for into such a place no man may enter bearing arms, nor near to where the king is. As soon as these soldiers have all taken their places the women begin to dance, while some of them place themselves in the circular galleries that I have said were (erected) at their gate of entrance. We can fitly describe to you the great riches these women carry on their persons – collars [a kind of necklace or a band of cloth richly adorned with pearls and precious stones worn around the neck] of gold with so many diamonds and rubies and pearls, bracelets also on their arms and on their upper arms, girdles below, and of necessity anklets on the feet. The marvel should be otherwise, namely that women of such a profession should obtain such wealth; but there are women of such a profession among them who have lands that have been given to them, and litters, and so many maid-servants that one cannot number all their things. There is a woman in this city who is said to have a hundred thousand *pardaos* and I believe this from what I have seen of them.

Then the wrestlers begin their play. Their wrestling does not seem like ours, but there are blows (given), so severe as to break teeth, and put out eyes, and disfigure faces, so much so that here and there men are carried off speechless by their friends; they give one another fine falls too. They have their captains and judges, who are there to put each one on an equal footing in the field, and also to adjust the honours to him who wins.

Fireworks

In all this portion of the day nothing more is done than this wrestling and the dancing of the women, but as soon as ever the sun is down many torches are lit and some great flambeaux made of cloth; and these are placed about the arena in such a way that the whole is as light as day, and even along the top of the walls, for on all the battlements, are lighted lamps, and the place where the king sits is all full of torches. As soon as these are

lit up there are introduced many very graceful plays and contrivances, but these do not stop long; they only approach where the king is and then go out. Then there enter others in other fashion, with battles of people on horseback; these horses are like the hobby-horse made in Portugal for the feast of the Corpo de Dios; others come with casting-nets, fishing and capturing the men that are in the arena. When these amusements are ended, they begin to throw up many rockets and many different sorts of fires, also castles that burn and fling out from themselves many bombs (tiros) and rockets.

Chariot and horse show

When these fireworks are finished, there enter many triumphant cars (chariots) which belong to the captains, some of them sent by those captains who are waging war in foreign parts; and they enter thus. The first belongs to Salvatinica, and they come in one after the other. Some of the cars appear covered with many rich cloths, having on them many devices of dancing-girls and other human figures; there are other cars having tiers one on top of another, and others all of one kind; and so in their order they pass to where the king is. When the cars (chariots) have gone out they are immediately followed by many horses covered with trapping an cloths of very fine stuff of the king's colours, and with many roses and flowers on their heads an necks, and with their bridles all gilded; and in front of these horses goes a horse with two state-umbrellas of the king, and with grander decorations than the others, and one of the lesser equerries leads it by the bridle. In front of this horse goes another caracoling and pracing, as do all horses here, being trained in that art. You must know that this horse that is conducted with all the state is a horse that the king keeps, on which they are sworn and received as kings, and on it must be sworn all those that shall come after them; and in case such a horse dies they put another in its place. If any king does not wish to be sworn on horseback, they swear him on an elephant, which they keep and treat with equal dignity.

These horses, then going in the way I have stated, pass twice round the arena and place themselves in the middle of the arena in five or six lines, one before the other, and the king's horse in front of them, all facing the king; they stand in such a way that between them and the men there is an open space all round. As soon as they are arranged in this way and are all quiet there goes out from the inside of the palace a Brahman, the highest in

rank of those about the king, and two others with him, and this chief Brahman, carries in his hands a bowl with coconut and some rice and flowers, while others carry a pot of water; and they pass round by the back of the horses, which all stand facing the king; and after performing his ceremonies there, he returns to the palace.

Women richly clad

After this is over you will see issuing from inside twenty-five or thirty female doorkeepers, with canes in their hands and whips on their shoulders; and then close to these come many eunuchs, and after these eunuchs come many women playing many trumpets and drums and pipes (but not like ours) and viols and many other kinds of music, and behind these women will come some twenty women-porters, with canes in their hands all covered with silver, and close to them come women clothed in the following manner. They have very rich and fine silk clothes; on the head they wear high caps which they call *collaes* [kulaya in Kannada, made of thick cloth and covered with fine embroidery and set with precious stones and pearls] and on these caps they wear flowers made of large pearls; collars on the neck with jewels of gold very richly set with many emeralds and diamonds and rubies and pearls; and besides this many strings of pearls and others for shoulder-belts; on the lower part of the arms many bracelets, with half of the upper arm all bare, having armlets in the same way all of precious stones; on the waist many girdles of gold and of precious stones, which girdles hang in order one below the other, almost as far down as half the thigh; besides these belts they have other jewels, and many strings of pearls [paijana or pende, an anklet of round beads in silver] round the ankles, for they wear very rich anklets even of greater value than the rest. They carry in their hands vessels of gold each as large as a small cask of water; inside these are some loops made of pearls fastened with wax, and inside all this a lighted lamp. They come in regular order one before the other, in all perhaps sixty women fair and young, from sixteen to twenty years of age. Who is he that could tell of the costliness and the value of what each of these women carries on her person? So great is the weight of the bracelets and gold and jewels carried by them that many of them cannot support them, and women accompany them assisting them by supporting their arms. In this manner and in this array they proceed three times round the horses, and at the end retire into the palace. These women are maids of

honour to the queens, and so are the others that go with them on each day of these nine days of the feast one of the queens sends, each on her own day, her ladies with the others. The officials, in honour of the feast, have the days divided between them in accordance with their custom as already arranged by the king; and these women come every day most richly attired, taking pleasure in showing themselves in such things, and in making a display each one of what she possesses.

When these women retire the horses also go, and then come the elephants, and after making their salaam they too retire. As soon as they are gone the king retires by a small door which is at the end of the building. Then the Brahmans go and take an idol, and carry it to the House of Victory, where is the room of cloth that I have spoken of, and the king at once comes from within, and goes to where the idol is, and offers his prayers and performs his ceremonies. Then, they bring there more buffaloes and sheep, and kill them in the same way as before, and then come the professional women to dance. As soon as the slaughter of the buffaloes and sheep is over the king retires, and goes to his supper; for he fasts all these nine days, and (each day) they eat nothing until all is finished, and their hour for food is midnight. The bayaderes remain dancing before the idol a long time after all this is done. In this way are celebrated these festivals of nine days; on the last day there are slaughtered two hundred and fifty buffaloes and four thousand five hundred sheep.

Armed forces parade

When these days of festival are past, the king holds a review of all his forces, and the review is thus arranged. The king commands to pitch his tent of Mecca velvet a full league from the city, at a place already fixed for that purpose; and in this tent they place the idol in honour of which all these festivals are celebrated.

From this tent to the king's palace the captains range themselves with their troops and array, each one in his place according to his rank in the king's household. Thus the soldiers stand in line; but it does not appear to you to be only one line but in some places two or three, one behind the other. Where there was a lake it was surrounded with troops, and where the road was narrow they were drawn up on the plain; and so on the slope of the hills and eminences, in such a way that you could see neither plain nor hill that was not entirely covered with troops. Those on foot stood in front of those

on horses, and the elephants behind the horses; in this array was each captain with his troops. The captains who had their stations inside the city, since the soldiers could not be drawn up on the flat roofs of the houses, put up scaffoldings across the mouths of the streets to hold the troops, in such a way that all were full, both outside and in.

Now I should like to describe to you how they were armed, and their decorations. The cavalry were mounted on horses fully caparisoned, and on their foreheads plates, some of sliver but most of them gilded, with fringes of twisted silk of all colours, and reins of the same [The reins were not of leather, but of silk twisted into ropes]; others had trapping of Mecca velvet, which is velvet of many colours with fringes and ornaments; others had them of other silks, such as satins and damask, and others of brocade from China and Persia. Some of the men with the gilded plates had them set with many large precious stones, and on the borders lace-work of small stones. Some of these horses had on their foreheads heads of serpents and of other large animals of various kinds, made in such a strange manner that they were a sight to see for the perfection of their make. The horsemen were dressed in quilted tunics [as can be seen on the sculptures of warriors mounted on horses and legendary animals carved on the pillars in the SE mandapa of the Vithala temple at Hampi], also of brocade and velvet and every kind of silk. These tunics are made of layers of very strong raw leather, and furnished with other iron (plates) that make them strong; some have these plates gilded both inside and out, and some are made of silver. Their headpieces are in the manner of helmets with borders covering the neck, and each has its piece to protect the face; they are of the same fashion as the tunics. They wear on the neck gorgets (*cofos*) all gilded, others made of silk with plates of gold and silver, others of steel as bright as a mirror. At the waists they have swords and small battle-axes, and in their hands javelins with the shafts covered with gold and silver. All have their umbrellas of state made of embroidered velvet and damask, with many coloured silks on the horses. They wave many (standards with) white and coloured tails and hold them in much esteem – which tails are horses' tails. The elephants in the same way are covered with caparison of velvet and gold with fringes, and rich cloths of many colours, and with bells so that the earth resounds; and on their heads are painted faces of giants and other kinds of great beasts. On the back of each one of them are three or four

men, dressed in their quilted tunic and armed with shields and javelins, and they are arrayed as if for a foray.

Then, turning to the troops on foot, there are so many that they surround all the valleys and hills in a way with which nothing in the world can compare. You will see amongst them dresses of such rich cloths that I do not know where they came from, nor could any one tell how many colours they have; shield-men with their shields, with many flowers of gold and silver on them, others with figures of tigers and other great beasts, others all covered with silver leaf work beautifully wrought, others with painted colours, others black and (*so polished that*) you can see into them as into a mirror, and their swords so richly ornamented that they could not possibly be more so. Of the archers, I must tell you that they have bows plated with gold and silver, and others have them polished, and their arrows very neat, and so feathered that they could not be better; daggers at their waists and battle-axes, with the shafts and ends of gold and silver; then you see musqueteers with their musquets and blunderbusses and their thick tunics, all in their order with their [rank] in all their bravery; it was indeed a thing to see. Then the Moors – one must not forget them – for they were there also in the review with their shields, javelins and Turkish bows, with many bombs and spears and fire-missiles; and I was much astonished to find amongst them men who knew so well how to work these weapons.

Astounding wealth

The king leaves his palace riding on the horse of which I have already told you, clothed in the many rich white cloths I have mentioned, with two umbrellas of state all gilded and covered with crimson velvet, and with the jewels and adornments which they keep for the purpose of wearing at such times: he who ever wears such jewels can understand the sort of things so great a lord would wear. Then to see the grandeur of the nobles and men of rank, I cannot possibly describe it all, nor should I be believed if I tried to do so; then to see the horses and the armour that they wear, you would see them so covered with metal plates that I have no words to express what I saw, and some hid from me the sight of others; and to try and tell of all I saw is hopeless, for I went along with my head so often turned from one side to the other that I was almost falling backwards off my horse with my senses lost. The cost of it all is not so much to be wondered at as there is so much money in the land, and the chiefs are so wealthy.

There went in front of the king many elephants with their coverings and ornaments, as I have said; the king had before him some twenty horses fully caparisoned and saddled, with embroideries of gold and precious stones, that showed off well the grandeur and state of their lord. Close to the king went a cage [a kind of small mandapa used for carrying gods in procession] such as is seen at Lisbon on the day of the Corpo de Dios festival, and it was gilded and very large; it seemed to me to be made of copper or silver; it was carried by sixteen men, eight on each side, besides others who took their turns, and in it is carried the idol of which I have already spoken. Thus accompanied the king passed along gazing at his soldiers, who gave great shouts and cries and struck their shields; the horses neighed, the elephants screamed, so that it seemed as if the city would be overturned, the hills and valleys and all the ground trembled with the discharges of arms and musquets; and to see the bombs and fire-missiles over the plains, this was indeed wonderful. Truly it seemed as if the whole world collected there.

In this way it went on till the king arrived at the place where the tent was that I have already mentioned, and he entered this and performed his usual ceremonies and prayers. You must not think that when the king passed the troops moved from their positions, on the contrary they stood motionless in their places till the king returned. As soon as the king had finished his ceremonies he again took horse and returned to the city in the same way as he had come, the troops never wearying of their shouting; as soon as he passed by them they began to march. Then to see those who were on the hills and slopes, and the descent of them with their shouts and beating of shields and shaking of arrows and bows that were without count. Truly, I was so carried out with myself that it seemed as if what I saw was a vision, and that I was in a dream. Then the troops began to march to their tents and pavilions in the plains which were in great number; and all the captains accompanied the king as far as the palace, and thence departed to rest themselves from their labour.

2. Navaratra festivities at Vijayanagar, nine castles erected, Fernao Nuniz[2]

This takes place in the month of September when for nine days they make great feasts. Some say that they do this in honour of the nine months during which Our Lady bore her Son in the womb; others say that it is only done

because at this time the captains come to pay their rents to the King. Which feasts are conducted in the following manner.
